THE ENCYCLOPEDIA AMERICANA

R

RUSSIA (ROSSIYA), the general name of those portions of Europe and Asia which until 1917 formed the dominion of the "Tsar of All the Russias," and which are now broken up into about 18 separate state formations. While the name Russia is applied to the whole area of the former empire it is frequently employed in a limited sense to Russia in Europe. The widest use of the term became current after the great expansion of the empire in the 19th century. The following articles, dealing with the area, topography, etc., consider Russia as it was at the beginning of 1917, before the fall of the empire. The history, government and political parties, language, education, etc., are considered as follows:

1. Geography, Topography, Political Divisions.
2. History.
3. Language.
4. Literature.
5. Drama.
6. Art.
7. Architecture.
8. Music.
9. Education.
10. Religion.
11. Government and Political Parties.
12. Industry and Manufactures.
13. Banking and Finance.
14. Railways and Communication.
15. Army and Navy.
16. Russia and the World War.
17. Russia, Diplomatic Relations of the United States with.

1. GEOGRAPHY, TOPOGRAPHY, POLITICAL DIVISIONS, ETC. Russia is a federated republic comprising the whole of eastern Europe from about 23° East, and stretching continuously for about 170 degrees over the whole continent of Asia to Bering Strait, or nearly half of the circuit of the world. The boundaries are the Arctic Ocean on the north, Bering Strait and Bering Sea on the east, the Pacific Ocean, Chinese Republic, Afghanistan, Persia, Asiatic Turkey and the Black Sea on the south, and on the west the new states of Ukraine, Poland, Lithuania and Finland. The length east to west is estimated at about 6,500 miles; the average breadth north to south is about 1,500 miles. The whole area is officially given at 8,417,118 square miles, approximately twice the area of Europe, and one-seventh of the land surface of the globe. The republic consists of several well-defined parts; European Russia, the latter although less than a fourth of the whole, including nearly three-fourths of the entire population; in Asia—northern Caucasus, Transcaucasia, the Steppes, Turkistan, the Caspian and Transcaspian, and Siberia. The appended table gives the official divisions of Russia as it was on 12 March 1917, the date of the *coup d'état*

which resulted in the fall of the Empire and the birth of the republic, their area, population and the density per square mile of land; the areas occupied by water are included in the total, but the densities of the population are calculated on the land area.

GOVERNMENT OR PROVINCE	Area, square miles	Population, 1 Jan. 1915	Density per sq. mile

Expansion in Asia was a marked feature of Russian policy from the 18th century. The first settlements on the Pacific slope were established on the Sea of Okhotsk, and by 1859 the boundaries were pushed as far south as the Amur River. In North America, Russia had extended its sovereignty over the Alaskan Peninsula, which, however, it sold in 1867 to the United States for \$7,200,000. (See ALASKA and ALASKAN BOUNDARY COMMISSION). In 1872 it compelled Khiva (q.v.) to acknowledge the suzerainty of the Tsar, and in the following year Bokhara (q.v.), on which pressure had been brought to bear since 1850, and which had been invaded in 1866, became practically a Russian dependency. In 1875, the island of Sakhalin in the Sea of Okhotsk, north of Japan, was ceded to Russia by the Japanese. In 1898, after Japan's successful war with China, Russia obtained from Japan a lease of the Liao-tung peninsula, with the important ports of Dalny and Port Arthur (qq.v.), and after the Boxer uprising of 1901, occupied Manchuria (q.v.). Meanwhile Armenia had been partly absorbed; Russian influence had been strongly established in the Mongolian steppes, and the military outposts in Turkestan had been extended southward in the Pamirs.

The continuity of the empire might appear to demand a detailed description in a single article; but its immense magnitude, and the distinct names commonly used to designate the different portions, make it more convenient to consider them separately under the heads of European Russia, and Siberia and Asiatic Russia. See article SIBERIA AND ASIATIC RUSSIA.

EUROPEAN RUSSIA.

Various classifications, partly historical and partly geographical, of the numerous divisions of European Russia, include Great Russia, Little Russia, South Russia, West Russia, the Baltic Provinces and Caucasus (qq.v.).

The boundaries of European Russia on the north and west are the same as those given above for the republic. Its southern boundaries also are the same as far east as the eastern shores of the Caspian Sea. The eastern boundary is not so well defined. In its northern part the Ural Mountains form such a definite natural barrier that their title to fix the frontiers of Europe and Asia, so far at least as the governments Archangel and Vologda extend, has been almost universally recognized. To the south of this the boundary may be said to be almost arbitrary, but is generally conceded to follow the Ural chain southward until it reaches the sources of the river Ural, and then follows the course of this river to its mouth in the Caspian. Parts of the governments of Perm and Orenburg, however, extend across the Ural Mountains, and are therefore in Asia. European Russia, as thus defined, is bounded northeast by the Ural Mountains, east by the government of Tobolsk, the steppes of the Kirghiz, and the Caspian Sea.

Topography.—The surface, in the most general view that can be taken of it, is two immense plains, the boundary between which is marked, though not very definitely, by a broad central ridge which stretches across it in an irregular waving line, mainly in a north-east direction, beginning on the frontiers of Poland, and terminating on the west side of the Ural Mountains, near lat. 62° N. This ridge forms the eastern continuation of the great watershed which divides the whole continent of Europe into a north and a south basin; but, unlike the west part, which is composed of lofty mountain chains or elevated plateaus, is only of moderate height, never exceeding 1,000 feet above sea-level. Even this height is attained only in the Valdai Hills, the far greater part of which, and of the remainder of the ridge, has an average height of not more than 500 feet. The only regions where the surface assumes a mountainous appearance are in the east, where the Ural chain, though nowhere, much exceeding 5,000 feet, looks more elevated, at least in its northern part, from its high latitude and consequent covering of perpetual snow; and in the south, where the Mountains of the Yaila chain, lining the southern shores of the Crimea, have a height of about 4,000 feet. With these exceptions the only other parts of European Russia which, according to the limits above assigned to it, do not belong to its two immense plains, are those districts of Perm and Orenburg which are situated on the east side of the Urals, and slope toward the almost boundless steppes of Asia. The coast-line of European Russia was confined to the Arctic Ocean until the end of the 17th century, and it was only by conquest that Russia obtained a seaboard on the Baltic and the Black Sea. The Arctic Ocean, affording excellent fishing grounds in the western portion, makes, with the White Sea, a deep indentation on the north coast, but its gulfs, Kandalaksha, Onega and Dvina, are ice-bound for nine months every year. Archangel, the chief port, is comparatively unimportant. Farther east, Cheskaya and Pechora bays are surrounded by frozen deserts. The Kara Sea, between the crescent-shaped island of Nova Zembla and the coast of Siberia, is navigable for a few weeks only every year. The islands of Kolgueff, Vaigatch, Nova Zembla, and the islands of Siberia are uninhabited. The Baltic Sea, with the Gulfs of Bothnia, Finland, and Riga, is the chief sea of Russia; but it nowhere touches purely Russian territory, its coasts being peopled by Finns, Letts, Esthonians and Germans. Nevertheless, three out of the five chief ports of Russia — Reval, Libau and Riga — are situated on the Baltic Sea. Two of them are frozen during four to five months every year; and Libau is the only one which has its roadsteads open nearly all the year round.

The Black Sea acquires more and more importance every year. The fertile steppes of its littoral are being rapidly settled, and the centre of gravity of Russia's population is gradually shifting south. The Black Sea suffers, however, from a lack of good ports. Its great gulf, the Sea of Azov (ports Taganvrog and Rostoff), is very shallow; the fine ports of the Crimea are too remote from the mainland; and the seaboard of Northern Caucasus is separated from the interior by a high chain of mountains.

Odessa is the chief port of this sea; and it has no rival in Russia except Petrograd. Nikolaiev is the principal naval arsenal; and Sebastopol remains a naval station. Batum, the chief port of Transcaucasia, is of great importance for the export of petroleum. The Caspian Sea, which receives the chief river of European Russia — the Volga — is a valuable medium of communication between the central Asian dominions and the Caucasus, as also for trade with Persia; but it has no outlet to the ocean, nor is there any probability of connecting it advantageously by canal with the Black Sea, its level being 70 feet below sea-level.

Hydrography.—The rivers are remarkable for their number and magnitude. The broad central ridge already referred to forms the great water-shed of the country, sending the waters on its north side either to the Arctic Ocean or Baltic Sea, and those on the south side to the Black Sea or the Caspian, thus forming four distinct basins. The Arctic Ocean receives directly the Pechora, which drains chiefly the western slopes of the Ural Mountains by a number of important affluents, accumulates them into one great flood, which then flows almost due north, and empties itself into a wide estuary remarkable for the number of islands which the alluvial deposits of the river have formed within it. Through the White Sea, the Arctic Ocean receives the waters of the Mezen, Northern Dvina and Onega. The most important of the three is the Dvina, which receiving its supplies in nearly equal quantities from the east by the Vitchevda, and from the west by the Suchona, proceeds northwest in a circuitous course, continually augmented by large affluents, and falls into the Gulf of Archangel, a little below the well-known port of that name. The surface drained by the rivers of this basin is almost entirely confined to the two extensive governments of Archangel and Vologda. The basin next in order is that of the Baltic. Its principal rivers are the Kemi and Tornea (the latter common to both Russia and Sweden), which fall into the Gulf of Bothnia; the Kymmene, Neva, and Narva or Narowa, which fall into the Gulf of Finland; the Aa and Düna or Western Dvina, which fall into the Gulf of Riga; the Niemen or Memel, which enters East Prussia before terminating its course; and the West Bug, an affluent of the Vistula. To the basin of the Black Sea belong the Dniester, South Bug and Dnieper, which have all their mouths at a short distance from each other in the neighborhood of the rising seaport of Odessa; the Don, which falls into the northeast extremity of the Sea of Azov; and the Kuban, which derives its chief supplies from Circassia. The last basin, that of the Caspian, is in some respects the most remarkable of all, since, though Europe sends it only two large rivers, the Ural and the Volga, both supplied in part from Asiatic sources, the latter not only surpasses all other Russian rivers, but is one of the greatest of Europe. The lakes of Russia are on a scale of magnificence commensurate with that of the rivers. To say nothing of the Caspian, which, being wholly surrounded by land, and even incapable from the lowness of its level, of discharging itself into any other sea, is truly a lake — Russia has others of vast extent. To the basin of the Baltic belong Ladoga, the largest lake in

Europe; Onega, Peipus and Ilmen. Almost all the other lakes of any size belong to the basin of the Volga; chief of these are the Bielo-Ozero, in the government of Novgorod, and the Koubinskœe, in the government of Vologda. In the south are several large salt lakes, among them the Elton and the Khaki Salt Marsh, in the Government of Astrakhan.

Geology.—A vast tract of gneiss and other crystalline schists, penetrated by granite, extends east from the Gulf of Bothnia, and north from the Gulf of Finland over the whole principality of the latter name, the western part of the government of Olonets, and the extensive part of the government of Archangel which is isolated from its main body by the White Sea. The only other region where a similar development occurs is in the south, where a large granitic steppe stretches in a southeast direction. It begins near Ovrutch, in the northeast of the government of Volhynia, covers the far greater part of the government of Kiev, as much of the government of Podolsk as lies north of the Bug, the northern half of the government of Kherson, the west and south of Ekaterinoslav, and a part of Taurida, and terminates in Ukraine just before reaching the shores of the Sea of Azov, from which it is excluded by a narrow belt of Tertiary marls and limestone. In the east, however, and along the whole crest of the Ural Mountains, from their commencement on the shores of the Arctic Ocean, and almost continuously southward to their last ramifications, granite of more recent origin than that already mentioned occurs, in connection with other eruptive rocks of greenstone, porphyry, syenite, serpentine, etc. These rocks are overlain on both sides of the chain by metamorphic schists, forming long and narrow belts nearly parallel with its principal axis. Immediately to the west appears a similar belt of Silurian strata, which, where lowest in the series, is in the state of chloritic and talcose schists. The only other locality where the Silurian system receives a marked development is on the southern shores of the Gulf of Finland, where it stretches from its western extremity east along the governments of Esthonia and Petrograd, and is then continued across the isthmus between the eastern extremity of the gulf and Lake Ladoga, and along the southern and southeastern shores of that lake. In immediate contact with this Silurian formation on the south, but on a much more magnificent scale of development, appears the Devonian system, or Old Red Sandstone. The main body of this formation begins near the southeastern shores of the Baltic, and gradually widens out with its northeastern and southeastern sides, so as to assume the shape of a wedge. It then forms a wide fork, sending one of its branches northeast across Lake Onega, and along Archangel Bay to the northwestern extremity of Mezen Bay, and the other southeast to the northwestern frontiers of Voronezh. It thus covers continuously the whole of the governments of Kurland, Livonia, Vitebsk and Pskof, and parts of Vilna, Minsk, Mohilef and Smolensk, on the one side, and of Petrograd and Novgorod on the other; while its northeast branch traverses Olonets, and penetrates into Archangel; and its southeast branch stretches over considerable parts of Kaluga, Orel and Tula. The only other localities in which the same formation occurs

is as a belt stretching south-southeast from the eastern coast of the Gulf of Tcheskaia in the Arctic Ocean, and in a longer but narrower belt on the western side of the Ural chain, where it immediately overlies the Silurian formation already mentioned. The formation next in order is the Carboniferous. The main body of it lies within the above fork of the Old Red Sandstone, and in immediate contact with it, and then keeping parallel with the northeast branch of the fork, is continued in the same direction to its termination in Mezen Bay. It occupies the whole of the government of Tver, the capital of which is situated near its centre; and large parts of Smolensk, Kaluga, Tula and Riazan on the one side, and of Novgorod and Olonets on the other. The government of Moscow is situated in the very heart of it, and that of Vladimir on its eastern side. It is evidently continued beneath these governments and covers part of their surface, the other and far greater part being covered by oolite or Jura limestone. The Carboniferous system occurs in two other distant and isolated localities; the one in the south, a little north of the Sea of Azov, where it occupies the eastern part of the government of Ekaterinoslav, and the western extremity of that of Don Cossacks, and where, too, the coal forming the characteristic mineral of the system is partially worked by pits; the other locality is on the western side of the Ural chain, where, in the ascending series, it succeeds the Silurian and Devonian systems, and has a larger development than either of them. This development of the Carboniferous system on the side of the Ural chain, and the still larger development above described as existing in the governments of Smolensk, Kaluga, etc., forms the opposite boundaries of a system which in European Russia is highly developed; and to which from the large space which it covers in Perm and the contiguous governments, the name of the Permian system has been given. Its rocks belong to the upper part of the coal measures and consist chiefly of magnesian limestone and new red sandstone. The latter name is still often applied to the whole system. The Permian system extends over the governments of Kostroma, Viatka and Kazan, and large parts of Archangel, Vologda, Yaroslav, Nijni-Novgorod, Simbirsk, Orenburg and Perm. In the north of the governments of Kostroma and Viatka, and more especially in the part of Vologda between the towns of Nikolsk and Ust-Sisolsk, it disappears for a time beneath strata belonging to the Jurassic or oolitic system. This system is developed partially in several other localities, and very largely in the northeast of the government of Archangel. Immediately above it in the geological series is the Cretaceous system, of which the principal localities are Chernigov, Orel, Kursk, Kharkov, and Voronezh, near the centre; Volhynia and a small part of Poland in the west; and a long tract along the northern base of the Caucasus. The rocks next in succession belong to the Tertiary formation, which in both its Eocene and Miocene periods is very largely developed. Strata of the Eocene period, beginning in the east in the government of Simbirsk, stretch west over the greater part of the governments of Penza and Tambov, then, after a considerable interruption, reappear on the frontiers of Kursk and Kharkov, cover the far greater part

of the governments of Chernigov and Poltava, and are thence continued without interruption into the governments of Mohilev, Minsk and Grodno. The Miocene period has its chief developments in Volhynia, Podolsk and Bessarabia. Beds of still more recent formation may be traced in the limestones, marls and clays on the northwestern shores of the Black Sea, on the far greater part of the Peninsula of the Crimea, on the eastern and northern shores of the Sea of Azov, on the low flats along the western and northern shores of the Caspian, and the low, sandy steppes of Astrakhan. Mere alluvial deposits, of comparatively recent date, are to be found in a greater or less degree at the mouths of all the rivers, and are particularly discernible in the great estuary of the Pechora. Vast numbers of erratic blocks and similar drift are spread over the greater part of northern Russia, evidently transported from Finland, Lapland and Sweden.

Climate.—As the country extends over 35 degrees of latitude, from the warmer regions of the temperate far into the regions of the frozen zone, it exhibits several marked diversities of climate, usually considered in four divisions—a polar region, including all the country north of lat. 67°; a cold region, extending from lat. 67° to 57° N.; a temperate region, from lat. 57° to 50° N.; and a warm region, from lat. 50° to 37° N. The characteristic features of the climate in general are a greater coldness and variableness than is common under the same latitudes in the more westerly parts of Europe. The mean annual temperature of the upper part of the Norwegian Coast to its extremity at the North Cape is above the freezing point, whereas a considerable portion of Russia within the same, and even in a lower latitude, is below it. This is true of the whole of Russian Lapland as far south as 66°; and to the east of the White Sea the thermal line, indicating a mean annual temperature of freezing, descends so rapidly that on reaching the Ural Mountains it is found to be as low as 60°. The region to which the name of cold has been given has a mean annual temperature varying between 32° and 40°, but very unequally divided throughout the year, the cold in winter often sinking the thermometer to 30° below zero, or 62° below freezing, while the summer heat often raises it above 80°. At Petrograd considerably below the centre of this region, the mean annual temperature is rather above 40°; on the other hand, that of Kazan, situated at the very south extremity of the region, but much farther inland, is rather below 36°. The temperate region, situated between lat. 57° and 50° N., has a mean annual temperature varying from 40° to 50°, and includes within it the far finest part of the Russian territory, though even there the thermometer has a very wide range, the summer heat, which suffices to grow melons and similar fruits in the open field, being often succeeded by very rigorous winters. The warm region, extending from 50° southward, well merits the name from its extreme summer heats, the thermometer in June and July standing commonly about 100°, and often considerably higher. It is not, however, free from the remarkable contrasts which a Russian summer and a Russian winter exhibit; for the Sea of Azov, situated almost in the heart of this region, usually freezes about the beginning of

November and is seldom open again before the beginning of April. In all the countries bordering on the shores of the Baltic Sea and the Arctic Ocean, and bounded on the west and north by the basin of the Volga, the air is charged with a superabundance of moisture, which descends in mists and frequent falls of rain or snow. Toward the centre, and still farther east, the superabundance of moisture disappears, though enough still remains to keep vegetation in full vigor even at the hottest season. Still farther south the want of rain is often felt and long-continued droughts do frequent mischief. In general, however, the climates of all the regions are not unfavorable to health.

Forestry and Flora.—Forests are found chiefly in the more northern districts, particularly Archangel, Vologda and Perm, and cover about 39 per cent of the total area of European Russia. In many of the central and southern governments a deficiency of timber is seriously felt and many extraordinary expedients are resorted to in order to obtain adequate supplies of fuel. The districts most imperfectly provided with wood are Esthonia, Bessarabia, Kherson, Ekaterinoslav and Astrakhan. The prevailing trees of the northern forests are fir, larch, alder and birch. The oak is seldom found beyond lat. 61°. A considerable proportion of the surface still continues almost in a state of nature; and, where it is well wooded, it is a question whether any other mode of occupation would be equally productive. Russia possesses about 3,400 species of phanerogamous plants, but the examination which botanists have made is incomplete and it is probable that many remain to be discovered.

The forest area of European Russia covers a territory of 474,000,000 acres. In the Ural Mountain region forests cover 70 per cent of the total area. In 1917 the revenues derived from the state forests amounted to 111,206,000 roubles (about \$55,603,000); the expenses amounted to 41,592,000 roubles (\$20,796,000), leaving a net profit of 69,614,000 roubles (\$34,807,000).

Fauna.—Animals, both domestic and wild, are numerous in Russia. Among the latter are the bear, the wolf, wild hog, the desman, the mole-rat, the saiga, the bobak or Russian marmot, the elk, the bison, the lynx and various animals which are hunted for their furs. Wild fowl abound, particularly near the mouths of rivers; among them the pelican frequents the shores of the Black Sea. Both on the coasts and in the rivers a great number of productive fisheries are carried on. In the Arctic Ocean whales are killed and vast numbers of seals are taken. The rivers of the Caspian, particularly the Ural and Volga, and the Sea of Azov, are celebrated for their sturgeon. In the same quarters are also important salmon fisheries. Reptiles are few and mostly innocuous.

Land Tenure.—Under the empire the political divisions of the Russian people comprised numerous grades of nobility, which were partly hereditary and partly acquired by military and civil service, especially the former, military rank being most highly prized. The clergy, both regular and secular, formed a separate privileged order. The higher clergy were formerly possessed of great wealth, but much of their property was confiscated by Catherine II, who compensated them by state pensions. Pre-

vious to the year 1861 the mass of the people were serfs subject to the proprietors of the soil. The emperors Alexander I and Nicholas I took the same initial steps toward the emancipation of this class; but a bold and complete scheme of emancipation was begun and carried out by Alexander II. The decree of emancipation was dated 3 March 1861 and began to come into execution within two years. There were about 22,000,000 of serfs belonging to private proprietors and rather more than that number on the crown lands. By an imperial decree of 8 July 1863, lands were granted to the peasants on all the estates of the Crown on a 49 years' rental equal to the former poll-tax and as a freehold estate at the expiration of this period. A similar arrangement was made on behalf of the peasants on the lands of private proprietors. The redemption money of the serfs with their land was estimated at 16½ years' purchase of their annual produce. Twenty per cent of this had to be paid by the serfs on procuring their emancipation, the remaining 80 per cent was guaranteed by the government, which levied it from the peasantry in a tax extending over 49 years. The emancipation of all the serfs on these terms was arranged for by July 1865, and from that date this form of servitude ceased to exist in Russia. From this change until 1917 the cultivable land in Russia was mainly distributed among three classes. The Crown held nearly 35 per cent, the emancipated peasants about 20, while the remainder, with the exception of mines and town lands, remained in the hands of the nobility and other landed proprietors. Soon after their advent to power in November 1917 the Bolsheviks undertook the solution of the land question. All private ownership was declared to be henceforth null; the land was nationalized and given to the people who cultivated it. The large estates of the nobility, all the lands belonging to the state and to the Church were left to the disposition of local committees pending a decision of the Constituent Assembly. Mines, forests and great waterways became the property of the state; while lesser forests and waterways were turned over to local communes.

2. RUSSIAN HISTORY. The Russian Slavs were one of the Asiatic tribes designated by the Greeks, "Scythians," who in unknown times immigrated into the vast plains of eastern Europe. They had settled near lakes and rivers in the primitive forests of the region extending east and west from lakes Ilmer and Chud to the lower banks of the Dnieper and the Dniester. There were other East-Slavonic tribes: the Lithuanians, west, and the Finns north of them, while the Turks and Tartars lived in the southeast. The Russian Slavs lived

in small communistic and patriarchic groups governed by the *Vieche* (a council of family elders) until the Variagi, or Northmen, helped them to form an independent state. No exact data is available concerning its origin. It is unknown whether the Slavs submitted to the Northmen of their own accord or whether they were forced into submission by conquest. According to the chronicle, the state originated in 862 when the three Varangian brothers, Rurik, Sineus and Truvor, became rulers of the Slavonic *Stenn* clan, the country began to be called Russia, and Novgorod became the centre of the principality. Simultaneously another centre, Kiev, sprang up in the south where two Varangian brothers, Askold and Dir, had formed another principality. Upon the death of Rurik's brothers, their territory also passed to him and he assumed the title Grand Prince. The successor of Rurik was his relative Oleg (879) whose wisdom and steady success gave him the surname "*Vieschi*," which means "soothsayer." He extended his rule over all the Slavonic clans except the *Viatichi* and imposed upon them a heavy tax. He took possession of Kiev and made it the capital of his principality, naming it "Mother of Russian Cities." He also led an expedition against Byzantium with the results which favored Russian business enterprises in Greece. Oleg was followed by his son Igor in 912, who also several times attacked Byzantium but with no success. His main object was to quell uprisings of subjugated Slavonic clans and to repel attacks of the pillaging savages of the Ural Steppes, called *Petchenegi*. He met his death in 945 at the hands of *Drevlian*, a Slavonic clan, while visiting them for the purpose of collecting the yearly tribute. Upon Igor's death, his wife, Olga, an energetic and cunning woman, became ruler for the time of their son's minority. She avenged her husband's death by setting on fire the capital of the *Drevlian*, *Kastrov*, and then subjugating its people. The most noteworthy event of her time is her conversion to Christianity (957).

When her son *Sviatoslav* became ruler, he displayed all his cunning and ambition in the numerous expeditions for the purpose of conquest. He defeated the Turkish tribe *Khazarui* and subjugated the *Viatichi*, the only Slavonic tribe still under tribute to them. At the suggestion of the emperor of Byzantium *Nikifor Fok*, he turned his weapons against the *Bulgars* along the Danube, but with no consequences. Returning home he was killed near Kiev by the *Petchenegs* who in his absence had attacked the city (972). *Sviatoslav* had divided his dominion among his sons, but it was reunited by the youngest son *Vladimir*; he killed his oldest brother *Yaropolk* who had already assassinated another brother *Oleg* and subdued several revolting clans. He also made several successful attacks on the *Poles*, the *Yatvags* and the *Bulgars* along the *Kama*. The most significant event of *Vladimir's* rule was the conversion of the Russians to Christianity (988) after *Vladimir's* conquest of the Greek city *Khersan*. Until then they had been pagans and worshiped all natural phenomena which they represented by different idols. *Vladimir*, at first cruel, voluptuous and an assassin, is known to history as the "Beautiful Son of Kiev," due to a change said to have been worked in him by the Christian faith. Following the custom of the time

Vladimir before his death in 1015 again divided the country among his sons, *Garoslav*, *Yaropolk* and *Sviatopolk*, but *Garoslav* reunited it at the time of the mutual fight of the brothers in which *Yaropolk* died and *Sviatopolk* fled. *Garoslav I* like his father divided in 1054 the Russian principality among his sons, the oldest receiving the principality of Kiev with the title of Grand Prince. This division of the country into a group of states was known as the system of Appanages. Each state had a ruling prince and subordinate or appanaged princes. The grand prince had authority over all of them and lived in the capital. He had a guard, called the *druzhina*, consisting of volunteer warriors who were his friends and counselors at all times and were well rewarded for their services. The *druzhiniks* (members of the *druzhina*) of the highest rank called *Boyare*, acted by the appointment of the king as viceroys in cities, as judges, called *tiunui*, and collectors of tributes and fines. The king himself was chief justice. The main administrative was the *Viechi*, a popular assembly convened by the princes. Its head was the *possadnik* elected by the people, who next to the prince was the highest authority. The *possadnik*, just as well as the *tiunui* guarded social order and conducted trials. Self-government had reached its highest development in Novgorod which had become almost an independent state. Novgorod was also the commercial centre in the North, just as *Vladimir* in the South, both having business connections with the Hanseatic Union formed of the German cities on the coast of the Baltic and the German Sea. While the system of the Appanages on the one hand favored the distribution of population and the development of commerce, on the other hand it led to internal wars of the appanaged princes. After *Yaroslav* the right of succession to the throne was transferred from the oldest son to the oldest in the family and *Yaroslav's* sons and grandsons ruled one after another. Their rule was greatly disturbed by internal wars of the appanaged princes, complicated by the question of seniority in such a large family as that of *Yaroslav*. During these struggles Kiev was subject to attacks and pillage which finally caused its fall. In the second half of the 12th century it was replaced by another capital, *Vladimir* upon the *Kliazma*. At that time Russia began to suffer from the destructive invasions of the *Palovtzui*, a tribe kindred to the *Petchenegs*. For better protection against the external enemy, the cousins and nephews decided to make peace and by the treaty in *Linbetz* (1097) resolved that everybody inherit his own paternal estate. In spite of it the internal wars continued until *Vladimir Monomakh*, the son of *Vsevolod* and grandson of *Yaroslav I*, became ruler. He was the first to realize the ideal of a peaceful principality with the grand prince as the supreme power. He exercised his authority to stop the wars of the appanaged princes and, instead, have them join him in his expeditions against the savages to check their invasions.

The internal wars, however, had considerably weakened the country, and it could not resist the wild hordes of the savage Mongols and Tartars. Their invasion resulted in Russia's subjugation to Mongol oppression (1237) and the formation of a Tartar kingdom, the *Zolo-*

taya Orda, along the lower Volga, with Sarai as its capital. In these days two prominent figures stand out. Aleksander Yaroslavitch Nevsky, prince of Novgorod, and Daniel Romanovitch Galitzki in the South. The first attained fame through his victory over Birger in the war against Sweden, and the second, by checking the invasions of the Lithuanians, who at that time had united with Poland and became a powerful principality to balance the power of the German orders on the Baltic Coast.

The first attempt at freeing Russia from Mongolian oppression was made by Dimitri Danskoi (1363–89). He defeated the Tartars in the famous battle of Kulikov 8 Sept. 1380 and after renewed attacks under Ivan III they were driven from Russia and the Zolotaya Orda was destroyed. The Lithuanian conquest pressing in from the west, and the Tartar invasion from the south, greatly impeded the growth of the Moscovite empire into which the north-western territories had begun to form, with Moscow, founded according to the chronicle by Yuri Dolgoruki (in 1147) on the Moscow River, as the dominating city and later, under Joann Kalita the capital and ecclesiastical centre. The first steps toward building the Moscovite empire was the annexation of the principality of Novgorod by Vasili I (1389–1425) and the abolition of self-government by the dissolution of the Vieche (1478) under Joann III (1462–1505), the son of Vasili II (1425–62) and the grandson of Vasili I. The two remaining territories, Pskov and Riasan, were annexed by the son and successor of Ivan III (1505–08).

The first prince to be crowned (1547) Tsar of Moscow was Ivan IV, son of Vasili III and Helen, the daughter of a Lithuanian magnate. This was a time of great oppression and revolt. The former friendly relations of grand princes and druzhina had long ceased. The peasants were in serfdom, having been tied by the Moscovite princes to the land which they cultivated. The members of the Boyarskaya Duma, the ruling power during Ivan's minority, contested for individual power at the expense of the people's freedom and the little Tsar's education. As a result he developed into a hard-hearted and cruel man, hence his surname "Grozni" (Terrible). Oppressing the people, Ivan was suspicious of disloyalties and was liberal with punishments by death. His lack of success in the war against the Polish King Stefan Batore he ascribed to treason. His bodyguard were the "oprichniki" (a band of young noblemen) of whom he required a complete renunciation of their parents, and absolute submission to him. These sad days were brightened by the conquest of Siberia, an achievement of the Cossacks of the Don and their leader Ermak. The hard and exciting times of Ivan the Terrible were followed by the peaceful rule of his son Feodor (1584–98), a pious and mild prince who left the ruling to the Boyarskaya Duma, headed by Boris Gudunov, his wife's brother. As he was childless and his brother Dimitri dead, the line of Ruriks came to an end with his death. The people and the *Zemskaya Duma* (an assembly of merchants and landlords which convened only in important cases) elected the cunning Boris Gudunov to the throne despite the opposition of many boyars. With this Tsar begins the

period of incessant troubles in Russia. Boris, suspicious of the hatred of the boyars, spared no punishments and, as a crowning piece of misfortune, the country was stricken by famine and epidemics. At his death he left the throne to his son but Lzhedimitri (False Dimitri), pretending to be Feodor's dead brother, by the help of the Polish King Sigismund, who dreamed of spreading Catholicism in Russia, seized the throne and ruled 11 months, when he was assassinated by a conspiracy headed by Vasili Shniski, who succeeded to the throne. During his rule another pretender, Lzhedimitri II, unsuccessfully besieged Moscow for two years. Here begins the period of interregnum and anarchy. The Moscovite Crown was threatened by the Polish King Sigismund and was saved only by the bravery of a meat merchant Kozma and Prince Pozharski; the former by his fiery patriotic speeches stirred the people of Novgorod, who, joined by other cities, elected Pozharski as their leader and forced the Poles to surrender. The Zemskaya Duma convened in 1613 and elected to the throne Michael Fedorovich of the dynasty Romanov. When the dynasty of Romanov came to the throne the Moskovite Empire extended from the Arctic Ocean to the mouth of the Don and Caspian Sea, and from the White Sea to the Ural Mountains and throughout Siberia. Its main cities were the capital, Moscow, fortified by the famous Kraul, and the two commercial cities Novgorod and Arkhangelsk engaged since Ivan III in negotiations with Holland, Germany and England. The territories in the immediate vicinity of Moscow were called the territories of the Grand Prince. They were inhabited by a mixture of Finns and Slavs. In the south lived the Cossacks, in the Don region, while Turkish and Mongolian tribes inhabited the steppes of Azov and the Black Sea. Southwestern Russia was occupied by the Polish-Lithuanian Kingdom, of which the main divisions were Little Russia, White Russia and Galicia. Though the Russians in these regions were the Greek Orthodox, the union of Liublin (1569) made them recognize the Pope as the ecclesiastical head. This aroused the discontent of the people and finally led to the uprisings of the Cossacks which resulted in the separation of Little Russia from Poland and its annexation to Russia under Alexei Mikhailovitch. Later (1667), however, the western region went back to Poland. With Michail (1613–45), anarchy came to an end and peace and order were re-established. The rule of his son and successor, Alexei (1645–76) is marked by a revolt of the people against oppression and heavy taxation as in the time of Ivan III. This pointed to the necessity of a new code of laws and the Sobornoye Polozheniye was composed. Ivan's oldest son, Feodor Alexsievich (1676–82), succeeded him and six years later was followed by Peter the Great, the youngest son of Aleksei Michailovich and Natalia Naruiskina, as his older brother Joann, son of Maria Miloslavskaya, was in ill-health. Owing to the ambition of their sister Sophia Miloslavskaya two parties formed and contested for the throne. The result was that both princes were crowned in 1682 and Sophia made regent till Peter's majority.

Peter the Great spent his childhood in the suburban Moscovite village surrounded by for-

eign friends and instructors. He often visited the German settlement called the Koki and made the acquaintance of German officers who assisted him in building a little army while playing at soldiers with his boy companions. German officers had been called to Russia by Peter's father and grandfather to teach the Russian soldiers military arts. There were at that time in Moscow many other foreigners of different professions, such as merchants, physicians, druggists, architects, who had begun settling there during the rule of Joann III, when relations with Europe, broken during the Mongolian oppression, had been resumed through his marriage with Sophia, the daughter of the emperor of Byzantium, who came to Russia together with many Greeks and Italians. At the age of 17 Peter I placed in a monastery his sister Sophia, who still had pretensions to the throne, and by means of intrigues tried to attain her ends and finally succeeded in sharing the reign with her brother. Tsar Peter's interest in the army and navy, which was shown in his early childhood, still continued. He went twice to Arkhangelsk to view foreign vessels and conceived the idea of gaining a foothold on the Azov Sea for the purpose of trading with Southern Europe. After an unsuccessful attack he triumphantly took possession of Azov in the next year (1696). He then set out traveling in western Europe to study fortresses and to learn the arts of Western civilization. He joined his own embassy to Europe and, disguised as a Dutch carpenter, settled in Sardam to study the art of shipbuilding. There he boarded with a blacksmith, but, upon identification he changed his abode for Amsterdam, where he continued his studies. He was impressed by foreign customs and manners and began reforming Russia according to foreign models. He tried even to change the appearance of the Russians by replacing the *feriaza*, a long coat with very long sleeves, by the long-tailed coat and the *kaftan*, and by prohibiting a beard to all except the clergy and the peasants, unless a tax were paid for the privilege of wearing one. He turned also his attention to the condition of women, against whose seclusion he strongly protested, and made the Moscovite princes introduce their daughters in society, costumed according to Western fashions. He organized gatherings for social intercourse which he called "assemblies." Marriage agreements were to be made only by the consent of the two concerned and not by their parents, as had been the custom up to this time. With the change of the Russian ways and habits Peter also started a reconstruction of the empire. In the place of the former *prikazni* he established *collegii*, the different branches of which were to take charge of commerce, revenue, army and navy, etc. The Boyarskaya Duma was replaced by the Senate and different German official ranks were substituted for Russian. Ecclesiastical affairs were entrusted to the Synod, an assembly of archbishops, which was to take the place of the former patriarchate. He was aware of the lack of education and established schools for children of the nobility, who were not allowed to carry before they could read and write. The army as well as the people, particularly the clergy and the *starovierti* (i.e., old believers), were dissatis-

fied with the foreign innovations. Protesting against the strict foreign discipline the army revolted during Peter's absence abroad, but the revolt was quelled and the rioters severely punished upon his return. Dissatisfaction with the reforms was persecuted and tried by a special secret court (*Tainoe Sudilishte*) before which one could be brought by any one who cared to denounce his personal enemies by simply pronouncing the words "*slovo i dielo*" (i.e., "word and act"). Peter replaced the militia called "*strieltzy*" by a standing army to be composed of peasants and urban population. Military duties became compulsory even for the young noblemen unless declared unfit or employed in the civil service. The greater part of his reign Peter spent in wars against Sweden. In alliance with Poland and Denmark he set out against the Swedes for the recapture of lost possessions along the Gulf of Finland, but after the battle of Narva (1700) retreated with heavy losses. This encounter with the Swedes was for him a lesson in the art of warfare and he utilized it to gain a foothold on the Finnish coast (1703) by capturing many cities in the absence of King Charles who was fighting the Polish king, August II. By taking possession of the Swedish fortress Nienshantz upon the Neva, he came into possession of the river, and under his own supervision built there a church and the Peter-Paul fortress as the nucleus of Petrograd which he now made the capital. Charles XII was lured again to Russia by his hopes to secure the Little Russia, whose hetman (or chief) Mazeppa turned traitor to Peter and promised to assist the Swedes with a great army of Cossacks. Charles XII met, however, with a crushing defeat in the battle of Poltava, 27 June 1709, and together with Mazeppa fled to Turkey. Here he instigated the Turkish sultan to declare war against Russia. With an army of 40,000 Peter set out for Turkey to face a considerably greater army of Turks and Tartars on the shores of the river Pruth. He was repelled, however, and by the Treaty of Pruth was forced to give up Azov and with it the outlet to the Southern seas and the mouth of the Don (1711). He succeeded, however, in establishing himself firmly on the coast of the Baltic Sea where, as a result of a warfare of 10 years, by the Treaty of Nieshtat (1721) Sweden ceded to Russia Livland, Esthonia and Ingria (the present district of Petrograd). In that same year he crowned himself, assuming the new title of "Imperator." Peter's infirm brother having died, his empire went to his grandson, Peter II, whose father, Aleksei, had died in exile escaping his death sentence pronounced against him by Peter I for expressed dissatisfaction with reforms. Peter Alekseyevich was, however, only 10 years old, and Peter's second wife, Katharine I, used the opportunity to become ruler for two years (1725-27). At the expiration of this period she appointed Peter Alekseyevich as her successor, and the Supreme Secret Council, a body of high officials, as the regents during his minority. As Katharine I was German by birth the chief officials of the empire under her were Germans, and Ostermann, the son of a German pastor, was at the head of the government. The same state of affairs continued when Peter

Alekseyevich died before he reached his majority, and the Duchess of Courland, Anna Joannovna (1730–40), the daughter of Joann V, ascended the throne. Biron, a native of Courland, was at the head of the government. He was a cunning and hard-hearted man who for his selfish purposes imposed a heavy tax on the peasants and exacted it with unusual cruelties. At that time Munnich, who was in charge of the military affairs, introduced strict discipline in the army. He was the founder of the corps of cadets for the training of military officers. He became Prime Minister under Anna Leopoldovna, a niece of Anna Joannovna and the mother of little Joann VI (1740–41), whom Anna Joannovna appointed her successor to the throne. The dissatisfaction of the people with a foreign court grew greater and greater, and as a result little Joann, with his mother, Anna Leopoldovna, spent the rest of his days in the Schluesselburg fortress where Biron was also imprisoned. The domination of Germans at the Russian court came to an end with Elizabeth (1741–61), second daughter of Peter I. Munnich and Ostermann were exiled to Siberia and the Germans were replaced by Russian statesmen, Razumovski and Shuvalov. In those days it became the custom to use the French language at the Russian court. The nobility and the bureaucracy, following the tone of the court, engaged foreign educators for their children. Elizabeth's rule was marked by valuable internal improvements. During her reign the first Russian university (1755) and the first Russian theatre were founded in Moscow, the Academy of Science having been established in Petrograd by Peter I. External affairs also proved to the world that Russia since Peter the Great was occupying a prominent position among European powers. It participated with great success in the Seven Years' War as an ally of Maria Theresa, empress of Austria, against the Prussian king, Frederick II.

The rule of Elizabeth's successor, Peter III, the son of her sister Anna, was of a very short duration. However, he succeeded in half a year in earning the gratitude of the people by abolishing the secret courts with its much-hated "Slovo i Dielo." He was succeeded by his worthy wife, Katharine II, née Princess Anhalt-Ferbst, whose rule of 34 years (1762–96) was for Russia a period of expansion. Russia came into possession of the long-desired outlet to the Black Sea, and hence to the Mediterranean by her victories over the Turks at Larga and Kagula (1770) under the command of Rumiantzev Zadunaiski in the so-called First Turkish War which ended by the Treaty of Peace concluded at Kuchuk-Kainardgi (1774); and in the Second Turkish War, under the commanders Potyenkin and Suvarov, in which she took possession of the famous fortresses Ochakov (1788) and Izmailil (1790) and, by the Treaty of Peace of 1791 concluded in Yassui, obtained the territory on the northern coast of the Black Sea. By the third partition of Poland, Russia annexed White Russia, Voluinia, Lithuania and Courland. This took place in 1795 when, after a desperate battle under the leadership of Kosciusko and the successive partitions, the Polish kingdom ceased to exist. During Katharine's rule Eastern Rus-

sia suffered a great deal from the insurrection stirred by the Cossack, Pugachev, who pretended to be the dead Peter III, and, with a band of Cossacks, Tartars and fugitives of discontented peasants and laborers of the Ural-works, attacked and took possession of one fortress after another along the Ural boundary, putting to death their commanders. The insurrection was finally subdued and its leader executed in Moscow in 1775. Catherine II carried out and promoted some of the important reforms started by Peter I. He had divided Russia into 12 districts; she extended the division to 150 governments (districts) with subdivisions into counties in 1775. Each district had its administrative and judicial departments. Two hundred villages were turned into townships with a local administration. The city charters of 1785 divided the urban population into three classes: the merchants, the citizens and the craftsmen. The centre of the city administration was the city council (*Gorodskaya Duma*) and its head was the mayor elected by the people. The nobility was granted a charter defining its rights and privileges. These were a voluntary military body exempt from taxation and corporal punishment. Peter the Great had placed church property under state supervision. Catherine II made the land and the serfs belonging to the Church property of the Crown in 1764. She attempted also a reform of the Russian judicial courts by abolishing tortures at trials and contemplated a code of new laws. She had composed her own legal maxims and appointed a committee to help her draw up a new code of laws, but these attempts were stopped by the outbreak of the Turkish wars. She showed great concern in the spread of education by establishing several city schools and a few other educational institutions; as also in the moral rectitude of the people by increasing salaries of officials in order to stop bribery. She also took an active part in educational reform by writing fairy tales and comedies in which she ridiculed vice for the purpose of correction. Her reforms were continued by her son and successor, Paul I (1796–1801). Of these the most valuable was the improvement of the condition of the peasant serfs limiting the service to their masters to three days in the week. He further reconstructed the army following the Prussian style which was then considered the model by all Europe. He introduced even the Prussian decorative court uniform of locks and pigtails. When the French Revolution broke out, Paul I formed an alliance with England, Austria and Prussia to fight the French revolutionists, but dissatisfied with his allies he soon withdrew his troops after some successful military operations in Italy. His successor, Alexander I (1800–25), is represented in history as a good-natured man of a friendly attitude who won the favorable disposition of the people by the changes which he at once instituted. Some of his edicts greatly improved the condition of the peasantry and gradually led to its emancipation. His main administrative reforms were: the removal of the system of collegii established by Peter I and their replacement by a group of ministers, such as the Ministry of the Interior, the Ministry of Education, Ministry of War and others. He

also established the Imperial Council which acted as a Senate or Upper House. His activities on the educational field are also significant, for he promoted the general learning of the masses, established many higher schools, as *Gymnasias*, *Progymnasias*, theological seminaries and universities. Under the protectorate of Alexander I, Karamskin compiled the first 'History of the Russian Empire,' and the Metropolitan of Moscow, Platon Sershin, wrote in 1812 a 'History of the Russian Church.' Alexander I appreciated to a high degree the works of Pushkin and Ktylov, the two great poets of his time. His further plans for internal improvements and reform were impeded by the great wars which swept over Europe with the appearance of Napoleon I. Russia participated in the anti-Napoleonic campaigns, first as an ally of Austria and was defeated at Austerlitz, and then as an ally of Prussia, both being defeated at Friedland. Peace concluded in Tilsit (1807) was soon disturbed again by the reappearance of Napoleon in 1812. He invaded Russia with a great army and despite the desperate fight of the Russians under the commander Barklai-de-Tolli, they were defeated in the famous battle of Borodino. Napoleon then proceeded to Moscow which he entered only to find it in flames and ruin. Famine and the severe cold of the Russian winter forced the French to withdraw with enormous losses. Napoleon hurried to France intending to return with a reinforced army, but Alexander I, by an offensive attack transferred the scene of military operations first to Germany and then to France herself. Allied with other European powers, he finally succeeded in defeating Napoleon and, by the Treaty of Vienna (1815), which gave Europe a general peace, Russia annexed the Polish territory along the Vistula. There were yet further territorial expansions of Russia under Alexander I through his wars against Sweden, Turkey and Persia. Upon the conclusion of peace with Sweden, Russia obtained all Finland, and the war against the Turks ended with the annexation of Bessarabia (1812), through the splendid victories of Kamenski and Kutuzov. About the same time Russia came into possession of the kingdom of Georgia. By a treaty of 1813 its king, George XII, agreed to have it become a dependence of Russia whose protection he sought against Turkish invasions. Alexander I was childless and his brother Konstantin Pavlovich, at that time Viceroy of Poland and residing in Varsow, was proclaimed emperor of Russia. He abdicated, however, in favor of his younger brother Nicholas. The dissatisfied people used this occasion for a rebellion. The leaders who were members of noble families and army officers persuaded the troops under their command that Nicholas was the author of a plot against his brother. The mutiny was quelled on 14 Dec. 1825, and a great number of revolutionists called "Decembrists" were executed or exiled. This incident of 1825 made Nicholas see the inadequacy of Russian laws for his times and he commissioned Strauski to draw up a new code of laws which appeared in 1833, known as "Svod Zakonov." The most important events of his rule were the abolition of the "Uniya" and the Polish insurrection which ended unsuccessfully. Nicholas I led two wars

against Turkey, the first for the liberation of the oppressed Greece, which came to a victorious end in 1829 and sealed by the Treaty of Adrianople, and in the second, called the Crimean War, Russia suffered heavy defeats at the hands of Turkey and her allies, England and France. After a vain resistance of 11 months, the strong fortress Sevastople, was destroyed in 1855. The Crimean War ended during the reign of Nicholas' successor Alexander II (1855-81). By the Treaty of 1856 Russia lost her control over the Black Sea. Alexander II continued his father's foreign policy of expansion. The southern boundary was pressed further down by the annexation of Eastern Caucasia (1859) after a continuous war of 60 years. Five years later the western part was also annexed. The Siberian frontier was moved southward at the expense of Central Asia where Russia made conquests in the wars against Bokhara and Kokand (1868). In 1877 Russia declared war against Turkey in support of the oppressed provinces of Serbia, Herzegovina and Montenegro. In the spring of that year the Russian army crossed the frontier, captured Nikropolis, and after successful battles of Shipka Pass and Plevna, stormed Kars to free its way to Constantinople. The Ottoman Empire was forced into submission and Alexander dictated the peace terms at San Stefano (1878) exacting for Russia a large war indemnity. The advantages gained by Russia were, however, lost again, due to England's and Germany's intervention. By the peace treaty in Berlin, Turkey's stability and independence were restored, Montenegro and Serbia were recognized as independent, and Bosnia and Herzegovina were given temporarily to Austrian administration. Russia, however, regained Bessarabia which she had lost in the Crimean War. It seemed for a time that Alexander II was stirring Russia toward greater liberty. On 19 Feb. 1861 he signed the famous manifesto emancipating the serfs and the charter, granted them in 1862 on the anniversary of Novgorod's millennium, made them almost self-governing. He recalled from Siberia the exiles of the conspiracy of 1825 and the Polish exiles of 1821. All this made the people hold out hopes for greater freedom. Bitter disappointment followed, for Alexander continued an autocratic strict policy with the oppression of non-Russian nationalities. Renewed Polish attempt for a separation was mercilessly crushed. Their oppression grew worse; the Polish language was banished from their schools, Polish landowners were made to sell their land and Poles were prohibited from buying. The Ukrainophile movement which had originated in Little Russia in Nicholas' time also grew stronger under Alexander's renewed oppression of the Ukrainians. Alexander's improvements in railways, telegraphs and postal service promoted financial development. This, however, affected but little the general prosperity of the people. The embitterment culminated in the assassination of Alexander II. The effect of this assassination was the austere policy of his son Alexander III who was crowned at Moscow in 1883. Every act of his expressed his opposition to reforms. It was a gloomy period of great restriction and oppression of non-Russian nationalities, the peasantry became more

impoverished. His foreign policy was that of expansion and he continued the conquest of Central Asia until the Siberian frontiers closely approached Afghanistan. The policy of Russian tsars was not, in the least changed under the last Romanov Nicholas II (1894-1917). His autocratic attempts for territorial expansion involved the country in the Russo-Japanese War which led to the surrender of Port Arthur and crushing defeats at Mugden. The despotic régime grew more intense. Pobiedonostev, called the "evil spirit of Russia," practically ruling Russia from 1881, now became omnipotent. The Zemstvos, rural provincial organizations created by Alexander II for the self-government of peasants after their liberation, were increasingly repressed in their activities. Poles, Jews, Armenians, Georgians and various sects of Orthodox malcontents were oppressed and persecuted. The anathematizing of Leo Tolstoy by the Holy Synod characterizes the country's attitude toward the freedom of speech and conscience. Despite the fact that Nicholas appealed in 1898 to the Great European powers to form a peace conference at The Hague for the discussion of terms for a lasting international peace, he had no sympathy with progressive reforms. These were achieved by the Revolution.

The Uprising of the Decembrists was the culmination of a long growing dissatisfaction which was still more stirred by the democratic ideas which the Russian officers brought back from their anti-Napoleonic invasion of France. Upon their return to Russia they formed secret societies for dissemination of these ideas. The organizers of these societies hoped to reach a democracy in Russia by influencing Alexander I, who in the beginning of his rule was very progressive and instituted many reforms. At first Alexander I seemed to bend toward the progressive element. He planned to grant a constitution and a large measure of self-government, but ultimately yielded to his reactionary advisers. He not only was on watch against the revolutionary movements at home, but also helped to suppress such in Germany, Spain and Italy, having obliged himself to do so by signing the protocol. The execution and exile which followed the suppression of the mutiny in 1825 still more embittered the people. The secret societies for the purpose of overthrowing the autocracy began to grow. Their branches scattered all over Russia. With the growth of popular discontent and unrest, the rule of Nicholas I, called the "Iron Tsar," became more austere and more oppressive. He tried to crush all progressive movements by establishing a strict censorship and a secret service police which became the terror of the fighters for liberty. The leaders of the societies called "circles," men like Petrashevski, Hezen and Bakunin, became more active. The discontent was followed by outbreaks on the part of the peasants. The defeats suffered by Russia in the Crimean War lessened in a high degree the confidence of the people in the government and the cry for reforms grew louder. When Alexander II ascended the throne he could not but obey the national will and he introduced a series of reforms, chief amongst which were the emancipation of the serfs, 1861. This, however, appeased the peasants only for a short time.

For though released the peasants continued to live in bondage. The soil allotted to them was to be paid for and the period for payment was 50 years. Autocratic ruthlessness continued. Its natural consequence was increased activity on the part of the revolutionaries. New secret societies came into existence. "Land and Freedom," organized in 1876, instigated agrarian uprisings. Their suppression was followed by terroristic acts. High officials were assassinated and finally Alexander II himself paid with his life, 13 March 1881.

The immediate successors of Alexander II, Alexander III and Nicholas II, were still more reactionary. Instead of carrying out reforms promulgated by Alexander II, they met demands for reforms with a greater restriction of the press, wholesale arrests and exiles to Siberia. These measures could hardly moderate the discontent. The oppression of the people took more definite form. The revolutionary element organized into parties which were mostly of a socialistic nature. The best known of these are the Social-Democratic and the Social-Revolutionary parties and the "Bund." The methods of fighting the government were also changed. Terroristic measures were replaced by a systematic development of revolutionary literature and its rapid spread. The failure in the Russo-Japanese War, in the same way, as the defeat in the Crimean War of the time of Nicholas I, discredited the government in the eyes of the people. Along with their legal movement for freedom grew out another which endeavored to bring about reforms by legitimate means. On 21 Jan. 1905, the people decided peacefully to approach the Winter Palace and to ask for freedom. The response of the government was firing upon the crowds in which there were many women and innocent children. This incident, called the "Bloody Sunday," enraged the people and a series of revolutionary outbreaks followed. This marked the beginning of the Revolution of 1905. Aware of the general popular unrest the government saw no other expedient but to grant a constitution in October 1905. The liberties which it promised, however, were withdrawn before they were ever realized. The general strike which followed the withdrawal was successfully broken and the revolters were savagely punished. Massacres of Jews crowned the triumph of the government. Of all granted reforms only one remained in force. This was the establishment of a Duma, i.e., a parliament, however, only of a consultative nature. The first Duma with a majority of Constitutional Democrats convened in April 1906, but was dissolved for its demands of a limited monarchy. The second Duma met with the same fate. The third Duma which was composed mainly of reactionaries was in session five years without accomplishing anything of importance. Exile to Siberia remained still a prominent and effective measure of the government. Only the fourth Duma elected in 1912 succeeded in bringing about a change of great significance. The unrest in the world of labor and strikes had ended by an apparent triumph of the government. When the War of 1914 broke out the Duma was still a pillar of reactionism. The Duma and the people were two hostile camps, but the war brought them together. Almost

all political factors found it advisable to join the Russian government in its struggle against German autocracy which oppressed Russia economically. Moreover, all Russians united in the common work of war relief for which purpose the *Zemstvos* became one of the main factors of the Revolution and formed an "All Russian Zemstvo Union" with a general committee and Prince Lvov as its president. The towns and different industries also formed into unions, while the people, both revolutionaries and conservatives, were drawn nearer to each other by common interests. At the same time, they began to lose their confidence in the government on account of its repeated defeats in the field. This lack of confidence was especially manifest when Russia's defeat and heavy losses inflicted by Hindenburg in the autumn of 1914 was followed by the execution of a member of the Russian General Staff, Colonel Myasoyedov, for treason; and, when after the occupation of Poland, Lithuania and parts of Lituania and Courland by the Germans, the Minister of War, Sukhomlinov, was found guilty of accepting bribes. The persecution of Jews and their removal from homes near places of military operations (1914-15), in order to veil the treacherous acts of the government, did not produce the desired effect on the people; on the contrary, it only increased bitterness.

The reactionary element of the people also became hostile to the government and when the Duma met in 1915, the Octobrists (the Conservative wing, so named after the manifesto of October 1905), joined their former political opponents and formed the so-called "Progressive Bloc" in August 1915. The main point of the program was the demand of a coalition government composed of men who would enjoy the confidence of the people, a true parliamentary form of government and various progressive reforms. This was the first move of the Duma for liberty and reform. Upon this, the reactionary Goremnikin, who was then at the head of the government, obtained the tsar's signature for the suppression of the Duma. The members of the Cabinet who favored concessions to the Duma were recalled and reactionaries appointed in their places. Furthermore, the government disgraced itself in the eyes of the people by its submission to the so-called "dark forces," i.e., a clique behind the government prompting and helping it to serve its private ends. The centre of those "dark forces" was a monk, by the name of Rasputin, who, playing upon the ignorance, superstition and prejudices of the Imperial Court, gained an easy access to it in 1905 and used its influence to obtain appointments and promotions to high official positions of the various charlatans who had won his friendships, as also the ruin of those toward whom he was not favorably disposed. His influence was so great that he once succeeded in forcing the very Synod to nullify its own decision. Among the associates of Rasputin there were such personages as the metropolitan of Petrograd, Pitrim, and Manasevich-Mamailov, who acted for the Russian government as secret agents. This influence of the "dark forces" on the government brought about the split in the conservative circles and a strange opposition of the few who endeavored to conclude a secret treaty of peace

with Germany. The people became especially suspicious when Boris Sturmer, the grandson of an Austrian Teuton, succeeded Goremnikin as Prime Minister with the portfolio of the Minister for Foreign Affairs, which he took from Sazonov, when the latter retired in demonstrative opposition to a separate peace with the Central Powers. In order to prevent any further anti-peace discussions the press of the country was severely censored. The heaviest blow, however, which caused great irritation, was the order of the cabinet in the spring of 1916, prohibiting all national conventions or conferences of the social organizations for relief work. But the protestation and unrest of the people were of no effective consequence as long as the armies were with the government. The revolutionary element, however, commenced gaining ground with the military circles. This was to a certain extent accomplished by the fact that most of the social workers at the front were revolutionary college students who spared no efforts to enlighten the soldiers by establishing schools in which they conveyed to them the idea of democracy. When the Duma met on 14 Nov. 1916, its speakers, one after another, attacked the government, and its president, Rodzianko, a rich landowner, who enjoyed the fullest respect of the conservatives of the country, came out openly against the Prime Minister, Sturmer. In the speech delivered by the leader of the Constitutional Democrats, Sturmer was also severely attacked. Even the reactionary Pirreshkevitz assaulted the Minister of the Interior who was guided by the policy of Sturmer and worked for a separate peace. For the first time in Russia's history, the greater majority of the Imperial Council sided with the Duma and severely criticized the government and the "dark forces" behind it. The congress of the nobility, which met in December, joined the rest unanimously denouncing the "dark forces." The War and Marine Ministers at once declared themselves on the side of the Duma and Prime Minister Sturmer saw no other way out of the difficulty but dissolving the Duma, and set out for the general headquarters to urge the emperor to approve of his step; but before he reached his destination he was informed of his dismissal by the imperial order. A. Trepov succeeded him. Before adjourning for Christmas the Duma adopted a resolution protesting against the forces undermining the nation's effort to win the war and endorsing the activities of the social organizations. The embitterment in high circles against the evil influences of the "dark forces" resulted in the assassination of Rasputin, 30 Dec. 1916. The murder was followed by the removal of several ministers whose seats were filled by strongest reactionaries. On 1 Jan. 1917, the tsar gave a blow to the liberal forces of the Imperial Council by issuing an edict recalling a large number of progressive members and replacing them with reactionaries. The bureaucrat Scheglovitov was made president of the council. The cabinet was also to be reorganized, replacing its members with strongest reactionaries before the next meeting of the Duma. On 27 February the Duma convened. On that day 30,000 laborers went on strike in Petrograd. The trouble in the Duma began with the refusal

of Schleglovitov to permit the leaders of the left group (revolutionaries) to make a declaration. In response to that measure the revolutionaries, together with a number of members of the centre, left the hall. The invitations sent by the leaders of the Progressive Bloc to the members of the cabinet for the discussion of measures for reform were ignored. Meanwhile hunger stirred the discontent of the people and soldiers, especially in view of the fact that food-supplies were found stored away by the police. In March riots began in Petrograd. The government responded by calling out troops to patrol the streets and proclaiming martial law. The demonstrations of all classes of people were becoming numerous when almost all the newspapers stopped their work and the organized laborers of Petrograd elected a council for the direction of general strikes and the great revolutionary movement that was pending. The Progressive Bloc, then still in session, framed a resolution to break with the government. The tsar issued an edict ordering its dissolution on 11 March. The Duma ignored the order. The government tried to restore its authority by ordering the police to use their weapons freely against the people. Disguised as soldiers of the Voluinski regiment they fired, killing and wounding about 200 of the crowd. In the afternoon the Voluinski regiment joined the revolutionaries. Other regiments, one after another, followed their example. The president of the Duma, Michail Rodzianko, sent to the tsar warnings at repeated intervals. The tsar, however, ignored the warnings of the Duma as well as those of his generals. Aided by the army the revolutionaries made gigantic steps. The main arsenal fell into their hands; police stations were demolished. The famous prisons, the Peter and Paul fortress and Schluesselburg, were attacked in a rapid succession. Joined by released prisoners, some of whom were leaders of the Petrograd uprising of 1905, the rebels proceeded to the secret service department and set on fire its archives. In the afternoon of the same day, 12 March, Taurida Palace, the meeting place of the Duma, was surrounded by the revolutionary forces. The telephone and telegraphic apparatus were captured. Kerensky, leader of the Social-Democrats, and Miliukov, leader of the Constitutional-Democrats, addressed the regiments and their speeches were cheered by the revolutionaries. Thus the people and the Duma joined hands to finish the work of the Revolution, while some of the reactionary officials either resigned, as did Premier Galitznini, or disappeared altogether. The members of the Duma appointed a council of 12 members representing all parties. This council, called the Duma Committee of Safety, represented the Duma and the Labor party and, after a night's session, issued a proclamation calling the people to order and effecting a complete overthrow of the old régime. On 13 March, various military organizations, headed by their officers, appeared before the Duma committee to express their submission, and on that same day the regiments defending the Admiralty surrendered. On 14 March the emperor's body guard joined the revolutionaries and the Winter Palace was occupied by the rebels. By a mutual consent of

the two representative bodies (Duma Committee of Safety and the Council of Workers and Military Deputies) a provisional government was formed which decided to ask the emperor to abdicate and proclaim Grand Duke Michael regent. The Committee of Safety in Petrograd then informed all other cities that the old government had been deposed and a new and temporary government formed by the Duma. The provisional government was at once recognized by all the cities of the empire. Moscow and Charkov were the first to do so. Also foreign governments, through their diplomatic representatives, recognized the new order of things and announced their readiness to enter upon negotiations with the provisional government. Meanwhile the ex-Premier, Sturmer, General Kurlov, General Komissarev and many other high officials were arrested. The chief of the Black Hundreds (i.e., the originators of massacres), Dr. Dubrovin and the metropolitan Pitrim, member of the "dark forces," met with the same fate. The Duma committee appointed a special commission to take charge of the railroads, telegraphs and telephones and of various other governmental departments. Encounters between the revolutionists and the police still continued and hundreds of the police officials were arrested. The revolutionists had the unanimous support of the commanders-in-chief and of the Petrograd clergymen and officers, who issued appeals to the people and armies, respectively, to continue their revolutionary work. On 15 March the tsar abdicated in favor of his brother, Grand Duke Michael, who, in his turn, abdicated the next day, thus ending the rule of the Romanov dynasty. As the people objected to the deposed tsar's liberty, he was placed, together with his family, under arrest in the Tzarskoe Selo where the guards had also revolted. The imperial family had to part with a great number of their servants and were deprived of all telephone and telegraphic connections with Petrograd. The colossal income of the tsar's estates now went to the State Treasury. The first step of the provisional government was the attempt to restore order and Professor Yurevich was appointed chief of police. Investigations in the former activities of the bureaucrats were started energetically as a preliminary step in their trials. Many chiefs of the fallen régime were arrested. Among these there were Baron Frederick, General Vozeykov and General Zrozovski of Moscow. The provisional government marked the beginning of its administration by ordering full amnesty to all political prisoners and offenders, the complete emancipation of the Jews, the abrogation of the Pale of Settlement, the abolition of death penalty, the abolition of the police and the formation of a militia. Soldiers were granted freedom of speech and uncensored communication with their homes. Immediately after the Revolution labor councils were formed after the model of the Petrograd council. The latter as well as the Duma Committee of Safety are supposed to remain in existence until the Constitutional Assembly meets, which will be elected on the basis of universal, direct and secret suffrage. See WAR, EUROPEAN; RUSSIA AND THE WAR.

WOISLAV M. PETROVITCH,
Chief of Slavonic Division, New York Public Library.

3. RUSSIAN LANGUAGE. In historical times the Slavic languages appear already subdivided into three groups, the southern, the western and the eastern. The southern comprises the Serbo-Croatians and Slovenians, known as Jugo-Slavs, and the Bulgarians; the western consists of the Czechs, Slovaks, Serbo-Lusatians and Poles; the eastern embodies all the Russian dialects. It is doubtful whether the present subdivision of the Russian dialects into Little, White and Great Russian goes back beyond the 11th century, but since then these have formed distinct groups, and the present growth of nationalism in the Ukraine bids fair to bring about a strong literary development of Little Russian, while White Russian may politically and socially disappear in the newly-created Lithuanian, Polish and Little Russian nationalities. Kiev was originally Great Russian, but early in the Middle Ages Little Russians kept moving up from Galicia until now they can claim linguistically the territory north as far as the government of Syedlets and parts of Grodno and Minsk. They hold the governments of Poltava, Kharkov, Voronezh and extend into Chernigov, Kiev, Volhynia, that is, they are found in the territory provisionally denominated as the Ukraine. The White Russian, an intermediary between Great Russian and Polish, is found in the governments of Grodno, Vilno, Vitebsk, Pskov, Mogilev, Minsk. Although used in historical documents in the Middle Ages it never developed a literature of its own.

The Great Russian, which we shall now call Russian, is divided into two large groups, by a line running from Lake Peipus to Nizhni-Novgorod and thence directly east. The chief characteristic of the southern group is the pro-

nunciation of unaccented *o* as *a*, which is not the case in the north. The chief representative of the southern group is the local Moscow speech, which is the basis for the official language, and, both on account of its political importance and the softness of its consonantal enunciation, bears the same relation to the Russian dialects that the Sienese or Florentine bears to the Italian dialects. But the Muscovite pronunciation is not rigorously followed outside the southern group. In the north the unaccented *o* remains *o*, and throughout the vast territory which belongs to Russia, without being Great Russian, the school pronunciation is normalized and more regular than in the soft utterance of Moscow, thus bearing the same relation to the Muscovite that the English of American schools bears to the Bostonian or New England pronunciation.

The language of literature and the Church up to the 18th century was not Russian, but Church Slavic, which is of southern Bulgarian origin, due to the dissemination of Christianity from Bulgaria. But from the very beginning the local Russian speech of Kiev intruded into the vocabulary and pronunciation of the Church and modified it, while the Bulgarian of the Church language similarly affected the spoken language. Thus the Church Slavic of Russia in time assumed a special aspect in the Church books of the Russian redaction, later to re-enter Serbia and Bulgaria and reintroduce a considerable Russian element into the southern languages.

The Bulgarian introduced a very large number of phonetic and morphological peculiarities into the spoken language, especially in words connected with the intellectual and religious life. The chronicles and judicial documents employed from the start a language which was essentially Great Russian, but with an admixture of Church Slavic words. Though originally an Indo-European language, Russian has a considerable non-Indo-European vocabulary. The Finnish tribes of the north and the Tatar nations of the south, even before the Tatar invasion, have enriched the vocabulary, and there are still other unaccounted-for elements in the language, which of late have been ascribed to a prehistoric residence in the Caucasus. Beginning with the 14th century Moscow takes the place of Kiev as an intellectual centre, and here the local speech, which arose from a union of southern and northern dialects, penetrates into the written language, and the local literary varieties of Novgorod, Tver and Rvazan soon pale before the administrative language of Moscow. Since then the Russian has received new linguistic additions. The most refined literary Polish furnished a considerable number of words, dealing with manners, and the introduction of the technical arts from the West opened the door to Dutch and German words, which entered in alarming quantity with Peter the Great. Later, the adoption of Western culture has given an enormous number of words from the German, the Romance languages and the Latin for scientific purposes. If one considers that possibly one-third of the Church Slavic represented Greek borrowings, and that these were also bequeathed to the Russian, one can see that the Russian, like most literary languages, is very composite in its

nature. From the 16th century on the spoken language is more and more used as a means of written expression, but up to the 18th century the Church Slavic maintained itself successfully in the Church. With the growth of culture, the spoken Muscovite and the Church Slavic blend into one, and in the second half of the 18th century the literary norm is established, to be perfected by Karamzin and Pushkin into a harmonious tongue, capable of all uses to which a literary language is put.

The Russian language is, in spite of the prevailing opinion, not a difficult language, although very rich in grammatical forms and forbidding to the beginner on account of its strange alphabet. The alphabet is identical with the Church Slavic, except that Peter the Great in 1708 simplified its letters by bringing them in harmony with the simpler Latin letters of the West. This current form of the alphabet is known as the civil alphabet, as opposed to the Church Slavic Kirilitsa. The alphabet consists of 37 letters, but two of them are rarely used, and the Bolshevik Minister of Education has ordered the abandonment of the useless hard sign and the superfluous *ye*, which is phonetically identical with *e* and of *y*, which is identical with *i*. This reform has long been mooted and, should it become universal, Russian would be the best phonetic language of Europe. The additional letters to the Latin alphabet are not a hindrance, but an advantage, because in Polish and Czech, where the Latin alphabet is used, the diacritical marks used to represent additional sounds are not conducive to easy and rapid writing. The accent is variable in Russian and extremely difficult if studied in itself. Therefore, all the better grammars and readers, even those for the Russian schools, where non-Russians may happen to be, are accented throughout. It can be acquired only by long practice, when analogy, which guides the native in his speech, automatically and with fair safety furnishes a clue to the accent of any new form one may meet. The pronunciation of Russian is not difficult, but the chief difficulty to the Westerner lies in his tendency to harden soft combinations. Before *e* and *i* and the vowels beginning with *y*, such as *ya*, *ye*, *yo*, all the consonants, but more especially the dentals, become distinctly palatalized, that is, these are pronounced not with the tip of the tongue pressing against the roof of the teeth, but by touching the palate with the tongue higher up. Another difficulty is the hard *l* before *a*, *o* and *u*, which is not pronounced, as in English, between the tip of the tongue and the root of the teeth, but, while the tip of the tongue rests against the teeth, by vibrating once the uvula and producing a guttural *l*, akin to a guttural *r*. The other sounds offer no especial difficulty. The phonetic changes within the conjugation of the verb or in derivations, which appear so puzzling to one beginning the study of Russian, is in reality produced by an attempt to remain phonetic, for in English or French practically the same phenomenon may be observed, only while the Russian writes *noshu* for *nosiu*, the English writes *mission* and pronounces *mishon*. A clear understanding of the law of phonetic change removes this difficulty far more thoroughly than the difficulty of the English pronunciation can be overcome by a foreigner.

The Russian noun has three genders and two numbers, like the Latin, and seven cases. Each gender is declined differently, but their plurals practically are identical, except for the genitive case, which causes some difficulty. The neuter singular does not materially differ from the masculine, but the feminine has totally different forms. What complicates the declension is the fact that words with a soft or palatalized ending have to be declined soft throughout, and there are very many variations in the genitive and prepositional cases, due chiefly to a confusion of the historic *o* and *u* declensions. Such forms can be acquired only through long practice. The dual of the Church Slavic has almost entirely disappeared, leaving but feeble traces in words naturally dual, such as that for "eye, ear." The most curious reminiscence of it is found after the numerals "two, three, four," when the noun stands in the genitive singular, because that form frequently corresponded to the nominative dual. From "five" on the genitive plural is used by analogy. The adjectival declension is interesting from the fact that by the side of an apocopated form of it, which almost entirely coincides with that of the noun and which is used only in the predicate, there is a fuller declension, formed originally from the nominal endings plus the corresponding endings of the personal pronoun of the third person, which was used as an article. Thus we have the curious phenomenon of a post-positive article, which is still in full use in Bulgarian, in existence in all the unrelated languages of the East, in the Scandinavian of Germanic origin, in all the Slavic languages, in Rumanian of Latin origin and in Albanian. The Russian is not fond of an attributive genitive and generally turns such into a corresponding adjective, hence it is far richer in adjectival forms than the languages of the West. The vast majority of family names ending in *ov*, *in*, *ovich*, *ski*, etc., are just such adjectives, hence the absence of titular *von* or *de*, or anything that corresponds to it, from the Russian vocabulary. The adjectives practically lack the superlative, which is supplied by the comparative or various intensive adjectives or particles. The chief difficulty in the formation of the comparative is the doubling of forms caused by drawing the apocopated comparative chiefly from the native Russian, and the full attributive comparative chiefly from the corresponding Church Slavic formation. The numerals are bothersome because every one of them is declined, and in a combination such as "one thousand two hundred and forty five men" six different declensional forms will occur. While the nominal declension is complex, the syntactical application of it is rather simple, because the abundance of cases, each one with a distinct function, obviates the difficulty which is ever present in a language without grammatical endings, such as French, where only the closest of attention makes one expert in the use of *de* and *à*. Thus Russian, though full of perplexing difficulties, has the unusual compensation of a language with a minimum of syntactical rules.

In the verb the relation between syntax and grammatical forms is reversed. Of the whole intricate structure of the Church Slavic, with its aorist and multiplicity of past tenses, very little is left. Only one, unconjugated past is

left. The future is a compound of *I shall* and the infinitive, but in a large class of verbs the present does duty for the future. Thus there is only one tense, the present, that really can cause difficulty, on account of a number of consonant changes that are liable to happen. There are only two conjugations, and a simple rule accounts for the great majority of the so-called second conjugation, leaving everything else to the first. There is a wealth of simple participial forms, which are also found apocopated and are called gerunds. These make it possible to express a large number of adverbial phrases in a very simple and precise way. But, to atone for the absence of a complicated conjugational system, there is the matter of aspects which to the beginner is likely to prove a stumbling block, but which supplies the language with a mass of delicate shades of expression which the Western languages can seldom render correctly. A verb expresses either the action, when it is of the imperfective aspect, or the result of an action, when it is of the perfective aspect. Most verbs have the two, and many are capable of even more delicate distinctions. An imperfective aspect may refer to an indefinite action or to an action with a definite aim; a perfective aspect may not only refer to the result of the action, but also to its suddenness, when it becomes self-active. In addition, there are iterative verbs, which represent frequently repeated action. Many verbs have all or nearly all of these forms, which differ from each other by suffixes and prefixes, added in a definite way. The perfective has only two tenses, the past and the future; the iterative only one; the past, and the imperfectives, all three. Only long training makes one perfect in the use of these, but in reading the matter is not of such pressing importance.

The Russian avoids the passive voice and has an exceedingly simple way of expressing the subjunctive, which is made up from the unconjugated past tense by the addition of a particle, but makes up these deficiencies not only by the very comprehensive aspects, but also by the use of a reflexive which does not differ from the rest of the verbs, except for the addition of the unchanged reflexive ending. Besides, a particular shade of involuntary action, such as to express the idea *I want to eat*, as the result of hunger, and not as a wilful act, is expressed by an impersonal construction, so that the ambiguity of the English is always avoided.

The sentence structure of Russian is simplicity itself. Though originally the Russian, through the Church Slavonic, based its sentence on the periodic Greek speech, Karamzin, who had studied in England, popularized the simple co-ordinate arrangement of clauses, as against the intricate and clumsy German subordinate periodic structure, and this simple style has remained the norm. The language is simple and direct. Add to this the facts that the order of words is quite immaterial, since it is guided exclusively by emphasis, that the indirect discourse is practically unknown and that a small basic number of words furnishes an inexhaustible number of derivatives of every imaginable shade of meaning, and it will become clear that the Russian language cannot possibly be so difficult as it is generally represented to be. The trouble is that all the troublesome points

are met with at the very start, but, while the difficulties of German, for example, keep increasing, the difficulties of Russian stop very soon. Thus in a given period, after the rudiments have been mastered, considerably faster progress can be made in Russian than in German.

As the Russian vowels are all open, except in specially favored positions, and the consonants are not harsh, the Russian language is particularly adapted to singing, even beyond Italian. For literary purposes it is especially good, since the most difficult ideas of any literary language can be rendered with remarkable fidelity; hence Russian literature abounds in fine translations, whether of Homer, Shakespeare, Goethe, Beranger or of any other foreign poet. The innate beauty of Russian has struck not only foreigners, but has long been known to the Russians, for already Lomonosov said of it, "One may find in it the magnificence of the Spanish, the vivacity of the French, the force of the German, the tenderness of the Italian, and, besides, the wealth and the expressive brevity of the Greek and the Latin," while Turgenev said of it that "it is unthinkable that such a language should not be given to a great nation."

4. RUSSIAN LITERATURE. Nothing whatsoever is known of any literary activity in Russia previous to the introduction of Christianity in the 10th century, and even for a long period afterward it found its expression, not in Russian, but in the language of the Church, that of the proto-apostles Cyril and Methodius, which in all likelihood was the Bulgarian, as spoken in the neighborhood of Saloniki. This Old Church Slavic was so close to the Russian dialects that it could be understood with little exertion by the clergy and those rare intellectuals who found any need to give expression to their thoughts. Up to the 12th century there is only a slim collection of sermons and exhortations, but at the end of this period we have the noteworthy 'Instruction of Vladimir Monomakh to his Children,' which compares favorably with similar spiritual testaments of the period, such as that of Saint Stephen of Hungary. A little later we get the admirable account of the Holy Land by Abbot Daniel the Palmer, which even now elicits praise for its realistic account of the time of the first crusades. To the same period belongs Nestor's 'Chronicle of Kiev,' that set the pace for a considerable number of local chronicles, from which in modern times the history of ancient Russia has been reconstructed. There must have existed, at that time, a considerable secular literature, but the Church ruthlessly persecuted any such manifestation, and only folk epics, for the first time collected in the 19th century, give us any poetical reminiscences of Kiev in the days of its greatest glory. Only one literary production of exceptional beauty has escaped the persecution of the Church, 'The Word of Igor's Armament,' a prose poem dealing with a disastrous expedition of Prince Igor against the nomad Polovtses of the South. This, too, was first published in the beginning of the 19th century, when it immediately attracted universal attention and was translated into many foreign languages. There also has been preserved a 14th century imitation of this production in 'The Exploits Beyond the Don,' which is an interesting account of the battle at Kulikovo in 1380. The Middle Ages are in Russia unusually rich in a mass of apocryphal stories, bestiaries and romantic adventures, which serve as important links between the

Greek and Latin apocryphal literature and similar productions in the West. As an example of these may serve 'The Holy Virgin's Descent into Hell,' which contains elements akin to those worked up by Dante in his 'Divine Comedy.' No appreciable addition to literary style is to be observed before the 16th century, when Polish scholastic learning at Kiev began to penetrate into Russia at the same time that Western ideas found their way to Moscow through the protection given to foreigners by Ivan the Terrible. It is then that we get the feeble beginnings of Russian history by the exiled Andrey Kurbski and the 'Book of Management,' the 'Domostroy,' by Ivan's adviser, Sylvester. This is apparently an attempt to create for Russia a manual of manners, such as at that time appeared in Italy and elsewhere. Its unusual harshness has made the 'Domostroy' a by-word for the Asiatic rudeness of the pre-Petrine civilization. Only at the end of the 17th century does a weak light enter from the West in the writings of Simeon Polotski, who came entirely under the influence of the Kiev scholasticism. He thus precedes the period of Peter the Great, with whom a new era dawns upon Russia.

Peter the Great abolished the old Church script, and introduced in its place the modern alphabet, which leaned to some extent on the Latin script. With this, Peter the Great broke with the ecclesiastic tradition, and by degrees the vernacular Russian, at first strongly impregnated with the Church Slavic, makes its entrance into the written language. The time of Peter was productive only of utilitarian works on mathematics and the applied sciences, but we have even then the remarkable economic work 'The Book on Poverty and Wealth,' by Ivan Pososhkov, the peasant manufacturer, who was called the Russian Adam Smith. 'The History of Russia' by Tatishchev did not see its light until the end of the century, as there was no interest as yet in such literary production in the time of Peter, but the 'Spiritual Reglement' of Prokopovich, who advocated Peter's liberal reforms, was one of the first Russian books to be translated into English. Kantemir's satires, based on those of Boileau and Horace, appeared in the time of Queen Anna, and about the same time talentless Tredyakovski established the prosody for the Russian poetry, and a little later the many-sided Lomonosov, in his poetical productions and scientific labors, laid the foundation for the literary norm, which half a century later was to be perfected in its present form by Karamzin. The second half of the 18th century is especially rich in the drama, where, however, nothing notable was produced, except in the comedy. Here we have the classical 'Odd People,' by Knyazhnin, 'The Minor,' by von Visin, and 'The Pettifogger,' by Kapnist. Among the writers of historical dramas are Sumarokov, the creator of the Russian theatre; Knyazhnin, whose republican sentiments in 'Vadim of Novgorod' created quite a stir, and Ozerov, whose 'Dmitri Donskoy' appeared opportunely on the eve of the Napoleonic War. Catherine herself tried her hand at the drama of manners, and by her example encouraged the creation of the satirical journals, in which Novikov was most prominent.

The first half of the 18th century did not

rise above an imitation of the French pseudo-classic school, but toward the end of the century the English influence, especially that of Addison, becomes more prominent. In 1790 there appeared Radishchev's 'Journey from Saint Petersburg to Moscow,' whose very title indicates its obligation to Sterne's 'Sentimental Journey,' and with it a spirit of liberalism, coupled with the sentimentality which held sway in the West, entered Russia. Of the poets of the time, who were also falling under Italian and Latin influence, the most prominent is Derzhavin, who bridges over from the 18th to the 19th century, and who, by his violent attack on the turgid ode of the preceding period, put an end to the slavish imitation of foreign models, and himself produced noteworthy poems. His 'Ode to the Deity' was translated into several languages and breathes an advanced Deism. Karamzin, who had lived in England, introduced the simpler English style into literature, and in his voluminous 'History of Russia,' in his sentimental novels, such as the famous 'Poor Liza,' and in his many sentimental poems, made the Russian language a perfect vehicle of thought. The romantic movement, then prevalent in Germany, had little effect upon Russia. Kameney's romantic poems and Zhukovski's excellent translations from the German did not create a school in Russia.

The end of the 18th and the beginning of the 19th centuries are rich in talents who made the West accessible to Russia in all literary endeavors. The influence of the French fabulists, especially LaFontaine, is seen in Sumorokov, the dramatist, in the poet Maykov, in Izmaylov, but reaches its apogee in the genius Krylov, who entered the literary field with some mediocre comedies, but gained universal recognition by his a little more than 100 fables, less than two for each year of his life, because he was the first to place the foreign models in a distinctive Russian setting. The sentimentalism, which was introduced by Radishchev, found its continuators in a number of poets, among whom Kozlov (1779-1840) is probably the most talented. In Vyazemski (1792-1878) sentimentalism, which came otherwise to an end in the 40's, survived until the end of the 70's. These poets sang not only of solitude, but also of the gentle home associations and the awesome sentiment of religion in places sanctified by age, and thus they introduced the worship of antiquity, which found its expression in the laudation of Moscow and Kiev, and the holy places, and led to a series of poets, not distinctly sentimental, who may be denominated as the patriotic and religious poets. Thus Glinka (1788-1880) published a series, 'Spiritual Songs,' and Ryl'eev (1796-1826), by his historical ballads, in which there breathes a spirit of liberty, incurred the suspicion of the government, and was one of the literary lights to fall a victim of the December Revolution. The Italian influence, especially that of Tasso, is discernible in Batiushkov (1787-1855), whose 'The Dying Tasso' is a poem of unusual merit, but who unfortunately was lost to literature for the last 35 years of his life, having become hopelessly insane.

In the drama Griboyedov (1795-1829) continued the tradition begun by Fonvizin and Kapnist, and his 'Intelligence Comes to Grief,'

in which he mercilessly flayed the old order of things, the servility, militarism and superficiality which harked back to the days of Catherine, remained for a long time a classic on the stage. The romantic movement of the English type, which reveled in the past and in adventure under exotic conditions, appealed to the younger generation in the beginning of the 19th century, and some notable results were achieved. Bestuzhev (1797-1837), who himself led a Byronic existence, wrote some good novels of martial adventure, such as 'Ammalat Bek,' and the historical novels of Lazhechnikov (1794-1869), 'The Heretic,' 'The Last Noviks,' 'The Ice House,' have lately been resuscitated from oblivion and are read with pleasure. But the poets of this school, Pushkin (1799-1837) and Lermontov (1814-41) have gained the greatest reputation. Pushkin began his career with some extravagant romantic poems, but during his banishment to the Crimea and the Caucasus he found the proper setting for the Byronism which was then taking possession of the nation, and to this he gave utterance in 'The Bakhchisaray Fountain,' 'The Gypsies,' 'The Prisoner of the Caucasus,' etc. His masterpiece is 'Evgeni Onyegin,' a novel in verse, which is considered as the prototype of a long series of Russian novels, in which the Russian hero is discussed. He tried himself in the historical drama and produced 'Boris Godunov,' a splendid poem, which is hardly fit for the stage. Having devoted himself to historical studies, he wrote 'A History of the Pugachev Rebellion,' and on his investigation based a series of stories, of which 'The Captain's Daughter' is probably the best. Lermontov even surpassed Pushkin in the facility of his verse, but his career was cut short at the age of 27, when he had already produced several volumes. Besides a number of tunable songs, he wrote a number of romantic poems, of which 'The Demon' is the most notable. Of his prose tales the most important is 'The Hero of Our Time,' which, as the title indicates, is a continuation of the question created by Pushkin in his 'Evgeni Onyegin,' and the hero of this new novel is the same blasé type as created by the Byronic attitude of the time.

The first half of the 19th century was particularly rich in poets, and among them must especially be mentioned Koltsev (1808-42), because he followed out the suggestion made some time before by Delvig that the popular element should find a place in the artificial poetry, and created a series of scenes from the homely life of the peasant and laborer, which at once made the poetry accessible to the masses, who still read him. At the same time Gogol (1809-52) struck out in a similar direction, by depicting the life of his native Ukraine, and the sordid existence of the small officials. His short stories, 'The Mantle,' 'The Nose,' etc., were the forerunners of his own longer tales and of the whole mass of realistic stories with which Russian literature has enriched the world. His 'Dead Souls' shows his obligation to Cervantes, but the story, in which we get a series of pen-sketches of country people, is unique and true to life. His 'The Revizor,' the best-constructed comedy to be found anywhere, in which he depicted the rascality of town officials, has remained a classic

until the present, and his romantic stories, such as 'Taras Bulba,' are still enjoyed in Russia and abroad. Gogol is the last of the men of the new period of Russian literature, and his appearance is the more significant, since it is correlated with that of the critic Byelinski, the first of a series of writers who viewed the Russian world of letters as an organic whole and who attached themselves more especially to some prominent author of his time. It was Byelinski (1811-48) who created the name of "The Natural School" as a specific manifestation of literature in Russia and illustrated his conception with an analysis of Gogol's works.

With Byelinski begins the newest period of Russian literature, which during his activity is characterized by an attempt to find itself. The years 1848-55, that is, up to the Crimean War, are the period of the "Censorship Terror," when the new authors, Shchedrin, Turgenev, Nekrasov and others were crushed and literature has no conquests to record. The next six years have been denominated "The honeymoon of Russian progress." The *belles-lettres* become "accusing," the foundation for this type of didactic writing being laid by the humorous Saltykov-Shchedrin with his 'Provincial Sketches.' Everybody was interested in the burning questions of the day, hence the importance of Chernyshevski's (1828-89) 'What to Do?' in which he applied the acid test to the questions of life. Turgenev (1818-83), who had written his epoch-making 'Memoirs of a Hunter' at the end of the 40's, now developed his literary activity in his famous novels, 'Rudin,' 'A Nobleman's Nest,' and in 1861 expressed the struggle of two generations in his famous 'Fathers and Sons.' During the same period appeared Goncharov's (1812-91) 'Oblomov,' a novel of the "Russian hero" type, which brought out a detailed analysis of the characteristic Russian novel by the critic Dobrolyubov (1836-61). Pisemski (1820-81) produced his best novel, 'A Thousand Souls,' and his best drama, 'Bitter Fate,' in which he was still constructively active, and not destructively hostile to the manifestations of progress. Ostrovski (1822-86) wrote his "humane" drama, which culminated in 'The Storm' (1860). Only the poets did not fare well during these six years and the following period, because they continued the tradition of "art for art's sake," which was violently attacked by the critic Pisarev. Thus the admirable poems of Maykov (1821-97), Fet (1820-92), Tyutchev (1803-73), Mey (1822-62) and many others suffered almost complete oblivion, as did the historical novel, 'Prince Serebryany,' and the dramas in verse by Alexis Tolstoi (1817-75).

The first half of the 60's is an epoch of reaction and Nihilism. It was then that Pisarev (1841-68) developed his destructive criticism which led to the abandonment of art for art's sake and the enthronement of the "poetry of the people" by Nikitin (1824-61), which was developed in its fullest form by the people's idol Nekrasov (1818-77). The period of Nihilism brought forward a considerable number of writers from the middle and lower classes of society, who devoted all their energy to the peasants and the submerged. The most talented among these were Pomyalovski (1835-63), Nicholas Uspenski (1842-89), Levitov (1842-

77), Ryeshetnikov (1841-71). To the same period belong the authoresses Marko-Vovchok (1830-1907) and Kokhanovskaya (1825-84), though they did not belong to the worshippers of "the people." The best novelist who dealt with the peasants was Slyeptsov (1836-78), whose masterpiece is 'Difficult Times.'

The 70's are denominated "the epoch of the highest development of altruism." In this period Saltykov-Shchedrin (1826-89) produced his masterly 'Family Golovlev' and 'Poshek-hon Antiquity,' Dostoevski (1821-81), has 'Memoirs from the Deal House' and 'Crime and Punishment.' Although Dostoevski had been met with indifference in the 60's, he now was acclaimed, on account of his later writings, as a moral teacher "from whom one did not learn what to love, but only to love." Leo Tolstoi (1828-1910), who had equally been received coldly in the 60's, and whose 'Anna Karenin' was viewed merely as a novel of high life, now attracted universal attention by his 'Confession' and his religious writings. The period was rich in authors of less pronounced talent. Lavrov (1823-1900), around whom gathered the progressive elements, exerted a great influence with his historical writings, especially his 'Introduction to a History of Thought.' Mikhaylovski (1842-1902), by his enormous number of sociological critiques, in which he, in opposition to Spencer, tried to show that "the ideal" is the most important part of the historical personality in history, created a whole school of "idealizing" novelists, among whom the most prominent are Zlatovratski (1845-), Naumov (1828-1901), Nefedov (1848-1902). This also led to the *narodnichestvo*, "the worship of the masses," which resulted in a very great number of scientific essays on the condition of the peasant, among the writers of which the most noteworthy are Vorontsov and Engelhard, and in the field of *belles-lettres* Glyeb Uspenski (1840-1902), by far the most talented author who dealt with the peasant. Other noteworthy authors, who did not devote themselves to "the people," are Garshin (1855-88), who wrote some remarkable short stories, Minski (1855-), the translator of Homer, Potapenko (1856-) and Korolenko (1853-), whose charming stories have been widely translated, the melancholy Nadson (1862-87), "the poet of the struggle," Yakubovich (1860-), the novelist Boborykin (1836-), whose voluminous activity tried to seize the transient phase of life. A similar activity was developed by the novelists Sheller (1838-1900) and Stanyukevich (1844-1903), who preached an intelligent progressivism, which also led to the critical labors of Pypin (1833-1905), whose 'History of Russian Literature' is a work of the highest order. Among the great host of authors of that period may be mentioned Melnikov (1819-83), who devoted himself to the portraying of the dissenters, Lyeskov (1831-95), who at first wrote stories about Nihilists, and later from the sordid provincial life, Karazin (1848-), the Russian Fenimore Cooper, who depicted central Asiatic scenes, Nemirovich-Danchenko (1842-), the military novelist, Mamin-Sibiryak (1852-), who revels in Ural scenes.

The eighties have been denominated "the epoch of despair," which was ushered in by the Pobyedonostsev reaction. Pobyedonostsev

(1827–1907) despised all progress and crushed all free thought, hence the ensuing pessimism and weakness of will, as it appears chiefly in Chekhov's (1860–1904) short stories and dramas, and even Leo Tolstoi's mysticism and desire for self-perfection is ascribed to the disheartening condition of the political life in the last two decades of the 19th century. Among the large number of feuilleton writers of this period there stands out Amfiteatrov (1864—) as a champion of freedom, while others, like Menshikov (1859—) turned sordid opportunists, and Tikhomirov (1850—) became a violent reactionary. Another result of the suppression of free thought was the resurrection of "art for art's sake," and here we find the poet Fofanov (1862—), Andreevski (1847—), Apukhtin (1841–93), Golenishchev-Kutuzov (1848—). Far more genuine was Frug (1860—), who sang of his Jewish compatriots, under the oppressive sensations of the pogroms. The period was rich in women who made a place for themselves in literature, such as Shapir (1850—), Krestovskaya-Kartavtsevaya (1862—), Dmitrieva (1859—), who depicted scenes from peasant life.

The 90's are a period of regeneration, as the previous decade had been more properly a period of decadence. It is particularly marked by the growth of Marxian socialism, which finds its expression in a large number of scientific and popular treatises on political economy by Plekhanov (1857—), Tugan-Baranovski (1865—), Bulgakov (1871—), and especially Lenin, the leader of social democracy. In the *belles-lettres* this socialistic tendency was represented by Chirikov (1864—), Veresaev (1867—) and Pyeshkov (1869—), who writes under the pseudonym of Maxim Gorky. Chirikov later busied himself with psychological studies, while Veresaev gained his reputation by his merciless analysis of a physician's activity in his 'Memoirs of a Physician.' Gorki, who has risen from the slum to be the famous author of the slums, revels in bright colors and "through beauty arrives at truth." He is the most pronounced follower of Marxism, and, in the spirit of his master, despises alike the bourgeoisie and the peasant, saving all his sympathy for the submerged "who dare."

In 1897 Andreev, who was discovered by Gorki, began to write his gloomy stories, in which appear decadents, half-insane, neurotic characters. Since 1904 he has fallen prey to symbolism, although he still deals with realistic scenes. At the same time modernists made their appearance, who, like the poet Balmont and the novelist Merezhkovski, have taken for their subject beauty and not morality. In his trilogy, 'Julian the Apostate, Leonardo da Vinci' and 'Peter and Alexis,' Merezhkovski dealt with the conflict of Christianity with the Antichrist, taking his part with the latter. Hence he, in his critical essays on Tolstoi, condemned the author for his Christian meekness. Similarly Balmont has taken to poetry, in order to treat art for art's sake, thus reverting to the older school. The most talented poet of this new movement is Bryusov, who in a dispassionate way describes the passions and dissolving death. He has also written a number of fantastic stories, such as 'The Fiery Angel,' a story of mediæval witchcraft. Other

modernists are the poet Ivanov, Blok and pessimistic Solugub. The latter has also distinguished himself in a number of novels, among which 'The Imp' is the best. A very prolific story-writer is Remizov, who portrays chiefly provincial scenes. It has not been possible to follow the literary activity in Russia since the beginning of the war, and nothing can be said of the outlook for the future.

Bibliography.—In the Russian language there are numerous aids to the study of its literature. One should consult the works of Aikhenvald, Arabazhin, Chukovski, Gornfeld, Milyukov, Morozov, Ovsyaniko-Kulikovskii, Pypin, Skabichevski, Tikhonavov, Vengerov, A. N. Veselovski. Russian literature as a whole has been treated in English in the following works: Baring, M., 'Landmarks in Russian Literature' (New York 1910); 'An Outline of Russian Literature' (London and New York 1914); Brandes, G., 'Impressions of Russia' (New York 1889); Hapgood, I. F., 'A Survey of Russian Literature, with selections' (New York 1902); Kropotkin, P. A., 'Russian Literature' (New York 1905); Waliszewski, K., 'A History of Russian Literature' (New York 1900). There are the following collections in English: Bechhofer, C. E., 'A Russian Anthology in English' (London and New York 1917); Tollemache, B. L., 'Russian Sketches, Chiefly of Peasant Life' (London 1913); Wiener, L., 'Anthology of Russian Literature from the Earliest Period to the Present Time' (New York 1902–03); Newmarch, R., 'Poetry and Progress in Russia' (London 1907); Bianchi, M. G. D., 'Russian Lyrics, Songs of Cossack, Lover, Patriot and Peasant' (New York 1910); Bowring, Sir J., 'Specimens of the Russian Poets' (Boston 1822); Pollen, J., 'Russian Songs and Lyrics' (London 1916); Selver, P., 'Modern Russian Poetry' (London 1917). A number of poets and novelists are dealt with in *The Russian Review* (London 1912—).

Harvard University.*

5. RUSSIAN DRAMA. In Russia, as in Greece, the drama arose from the comingling of the religious and secular elements. Mystery plays were imported through Poland and Kiev from western Europe and introduced into Moscow by Semyon Polotski in the time of Tsar Alexis (1645–76). Johann G. Gregori, a German Lutheran pastor, translated German mystery plays, and Dmitri Rostovski produced some akin to the moralities, in which Biblical characters were supplemented by allegorical personifications. The introduction of these crude beginnings was to some extent facilitated by the previous existence in Russia of religious ceremonies (*deistva*) having a slightly dramatic character. Gradually moral reflections and local touches were introduced into the religious dramas, Western plays of non-religious content were produced, French comedies (Molière), translated, and finally plays on Russian themes were staged. Four theatres are mentioned in Petrograd in Peter's time (1702–24).

Thus was paved the way for Sumarokov (1717–77), the first Russian literateur by profession, who in some 20 plays, imitations of Racine and Voltaire, popularized in Russia the

pseudo-classical drama with its rigid "unities," and artificiality. The theatre now became firmly grounded and the profession of actor (Volkov, Dmitrevski) was established. This type of play remained extremely popular until the middle of the 19th century and still finds some favor. But the great wave of democracy which has been rolling over Europe since 1775, and which brought the French and American revolutions, the insurrections of 1848, the liberation of the American slaves and the Russian serfs, and which has at last culminated in the Russian Revolution and the plans for a League of Nations—this wave swept away the old drama and brought on its crest the modern national, *Russian Realistic Drama*.

Even as early as 1769 the Empress Catherine's favorite, D. I. von Visin, to a considerable extent abandoned the artificial ways of his predecessors. He represented contemporary life in a fairly faithful manner and gave his plays a direct social purpose—the satirizing of the effete nobility. He was followed by Krylov (the wonderful fable writer) with similar but inferior plays. During the entire first half of the 19th century (during which period the romantic school—represented by Lermontov's 'Demon,'—exercised a considerable temporary influence in Russia) only three important dramas approaching the newer type appeared: Griboedov's comedy 'Woe from Wit,' Gogol's comedy 'The Inspector' and Pushkin's tragedy 'Boris Godunov.' Although the first drew much from Molière's 'Misanthrope' and although the last bears considerable resemblance to Shakespeare's historical dramas, yet all are undoubtedly long steps in advance toward the realistic drama. This is particularly true of 'The Inspector.' In 1850 appeared the first of the 48 plays of Ostrovski, who is rightly regarded as the father of the national drama, since he not only developed its distinctive characteristics to a high degree but also won for it a permanent place on the Russian stage.

Ostrovski, in keeping with the democratic trend of contemporary thought, turns away from the nobility and the official classes, which up to his time had been the chief subjects of drama, and devotes himself to the large middle and lower classes of the Russian cities, particularly to the merchants of Moscow. He raised his voice against everything among them that stood as a bar to human liberty. In method and style he is frank, direct and simple. Simplicity is revealed in the plot, which offers a striking contrast to the relatively complex plots of most Western plays. Often there is scarcely any trace of a traditional plot. His plays are more like a series of pictures of daily life quietly unfolding, than like a series of unusual events combined with a view to revealing their complex interrelations and collisions of interests. There are comparatively few characters, sometimes astonishingly few (four, five or six), which precludes the massing of characters for striking effects upon the stage. Simplicity is revealed also in the language, which is the language of the people and not the stilted artificial language of the classic stage. The simplicity of Ostrovski's art also appears in the small amount of action on the stage and the relatively calm emotional tone that pervades his

plays. Many Russians think that this is characteristic of modern life in general as contrasted with, for example, mediæval life; they believe that thought (reasoning) are coming to decide men's fortunes more than violence. In most Russian dramas at any rate, the actors appear and disappear without great bustle or excitement. They talk about the most ordinary events of life, the weather, the town gossip; yet little by little it becomes clear that these apparently trifling matters are really the most important of all, and that these people are passing their most critical days and deciding, though half unconsciously, questions that will determine, not only their own fortunes, but the future of society as well. "The comedy" (and tragedy) "of Ostrovski is not the comedy of intrigue or of character, but something quite new, which could be called the drama of life, if the term were not too wide and indefinite. I mean that throughout his plays he puts into the foreground the general conditions of life which are not dependent upon any of the characters of the play. He does not punish either the miscreant or the victim. They both arouse our pity, sometimes our mirth. But it is not upon them that our emotion centres. We see that their environment controls their actions, and that they have not the energy to oppose it. So the conflict demanded by the theory of the drama is not comprised in the dialogue, but in the conditions which control the characters. Often the characters have no appreciation of their own position or of this conflict. But the conflict goes on in the listener, who is incensed by the conditions of life that beget it."—Dobroliubov.

All these qualities of Ostrovski's art may be summed up in the word realism. But Russian realism is of a peculiar type, because the Russian writers are not simply realists; they are also intense idealists. Yet they understand that man cannot attain Utopia by mounting above the clouds on the golden wings of fancy. Though guided by his ideals, he must erect a staircase slowly and with toil out of acts of his daily life. Russian realism is a fusion of realism and idealism. Through its pictures of the realities of life shimmers life's religious, moral and social significance.

Contemporary with Ostrovski were Turgenev and Potekhin. The plays of the former, though inferior to his other writings, are of a high merit. Potekhin's plays, being outspokenly democratic, met serious opposition from the censor. Pisemski's, 'A Bitter Lot,' is the most effective peasant drama before Leo Tolstoi's 'The Power of Darkness.'

The chief writers of drama since Ostrovski are Chekhov, Gorki and Andreev. Chekhov, who was primarily a short story writer, wrote five regular plays and several short dramatic pieces. A few years ago statistics of the public libraries showed that he was the most widely read of Russian authors. In his plays he treats the middle and upper classes of the reactionary period of the age of reconstruction following the emancipation of the serfs. Only one of them, however, 'Ivanov,' was written in the earlier, more pessimistic period of his career. He is particularly remembered for the marvelous success of his 'Sea Gull' when it was staged by the Moscow Art Theatre of Stanis-

lavski, and for his contributions to the success of this theatre, which has had such an enormous influence over the western European stage. His realism was of so distinct a type that it struck even the Russians, who called him the "poet of actuality."

Gorki said of himself, "I have come from below, from the nethermost ground of life, where is nought but smudge and murk. . . . I am the truthful voice of life, the harsh cry of those who still abide down there and who have let me come up to bear witness to their suffering." This statement is not true to so great an extent of his dramas as of his stories, since there are in them many characters of the middle class, as for instance, in 'The Smug Citizen,' 'The Barbarians,' and even 'Enemies,' which deals with the labor problems. All of Gorki's plays are powerful—gripping, in fact.

Some of Andreev's plays, as 'Ekaterina Ivanovna,' 'Professor Storitsyn,' 'To the Stars,' 'Savva' and 'Days of our Life' follow the traditional type we have just been discussing, but he has also produced a number of symbolic dramas which is an entirely new type. One of these, 'The Life of Man,' has met with remarkable success on the stage, but others present enormous technical difficulties in presentation ('The Ocean' and 'The Black Maskers'), or were prohibited by the censor ('King Hunger'). Andreev represents, par excellence, the "tragedy of thought" mentioned above. Indeed, he has written one drama entitled 'Thought.' Andreev is second perhaps only to Dostoevski in his powers of psychological analysis, and few, if any, surpass him in power of vivid description. His style is at times impressionistic in a remarkable degree, although he is equally at home with realism and symbolism.

The last three decades have brought forth many other meritorious writers of the drama in Russia. Yushkevich in his 'King Hunger' and 'Dina Glank' (also called 'The City') has drawn faithful pictures of the life of the Jews in Russia. Artsybashev produced a drama 'Jealously,' which for months was the sensation of the Russian intellectuals. Other writers of the drama are Chirikov, Nadson, Garin and Chulkov. Evreinov is less distinctly Russian.

The historical drama cannot be said to be a great success in Russia. Only a few patriotic dramas like Pushkin's 'Boris Godunov' and Alexis Tolstoi's trilogy 'Death of John the Terrible,' 'Czar Fedor Ioannovich,' 'Czar Boris,' dealing with the establishment of the house of the Romanovs, have occupied a prominent place on the stage. The reason is that in Russia, literature has served during the past century primarily as a guide to a philosophy of life and to the solution of life's practical problems. Hence it has dealt almost exclusively with contemporary life and has left the dead past to bury its dead.

Translations of Russian dramas into English (the names of the translators are in parentheses):

ANDREEV.—'To the Stars' (Goudis; in *Poet Lore*, 1907); 'Anathema' (Bernstein); 'Life of Man,' 'The Black Maskers' and 'The Sabine Women' (Meader and Scott); 'The Life of Man' (Hogarth); 'The Sabine

Women' (Seltzer); 'Savva' (Seltzer); 'The Sorrows of Belgium' (Bernstein); 'King Hunger' (Kayden; in *Poet Lore*, 1911); 'Love for One's Neighbor' (Seltzer).

CHEKHOV (or Tchekoff).—'The Sea Gull' (Eiseman; in *Poet Lore*, 1913); 'The Sea Gull' and 'The Cherry Orchard' (Calderon); 'The Sea Gull,' 'Ivanov,' 'Uncle Vania' and 'The Swan Song' (Fell); 'The Three Sisters,' 'The Cherry Orchard' and other plays (West); 'The Cherry Orchard' (Mandell); 'A Marriage Proposal' (Chambers, also by House); 'The Wedding and The Jubilee' (edited by Bechhofer).

EVREINOV.—'A Merry Death' and 'The Beautiful Despot' (edited by Bechhofer).

GOGOL.—'The Revisor' (also called 'The Inspector-General,' Sykes); same (Mandell); same (Seltzer).

GORKI.—'The Children of the Sun' (Wolfe; in *Poet Lore*, 1906); 'The Smug Citizen' (Hopkins; in *Poet Lore*, 1906); 'Summer Folk' (Delano; in *Poet Lore*, 1895); 'A Night's Lodging' (Hopkins; in *Poet Lore*, 1905); same separately under title 'Submerged'; same under title 'The Lower Depths' (Irving); same under the title 'In Lower Depths' (Chambers).

GRIBOEDOV.—'Gore ot uma' 'Woe from Wit' (Benardaky); also same under the title, 'The Misfortune of being Clever.'

KOSSATCH (pseudonym: *Lesya Ukrainka*).—'The Babylonian Captivity' (from the Little Russian language by Volska).

OSTROVSKI.—'The Storm' (Garnett); 'A Protégé of the Mistress,' 'Poverty is No Crime,' 'Sin and Sorrow Are Common to All,' and 'It's a Family Affair' (edited by Noyes).

PUSHKIN.—'The Statue Guest,' 'Mozart and Saglieri' and 'Boris Godunov' (Turner).

TOLSTOI, LEO.—'The Fruits of Culture' (L. and A. Maude; also by Wiener; by Schumm; by Dillon); 'The Power of Darkness' (L. and A. Maude; also by Wiener); 'The Living Corpse' (Wright); 'The Light That Shines in the Darkness' (Wright); 'The Cause of it All' (Wright); 'The First Distiller' (L. and A. Maude).

VON VISIN.—'The Choice of a Tutor' (edited by Bechhofer).

Bibliography.—Kropotkin, 'Ideals and Realities of Russian Literature'; Brueckner, 'A Literary History of Russia'; Waliszewski, 'Russian Literature.' Consult also introductions to the various translations.

Professor of Latin, Sanskrit and General Linguistics, University of Michigan.

6. RUSSIAN ART. In studying Russian art we have to consider two distinct periods—the ancient and the modern. The ancient, which extends from the earliest origin to Peter I, is characterized by an imitation of Byzantine art imported into Russia from the South and partly from the West, and by the blending of the Byzantine and the Russian elements into an original type of art. The modern period, which begins with Peter I, is marked at first by a strong West-European influence, and later by a strict realism and the development of a typical Russian art.

The beginning of Russian art dates from the

remotest times when the Slavs, who formed the Russian Empire, expressed their artistic instinct in their animal-like shaped instruments, in the reproduction of their gods, in their works of wood, stone, metal and pottery and in their decorations of household objects and clothes. The history of art properly begins, however, only with the time of Saint Vladimir. Immediately after the introduction of Christianity, Byzantine builders, painters, decorators and engravers were called to Russia to build churches and decorate them. The first stone churches in Kiev, the Vasilyevskaya and the Desyatinnaya, were built on the Byzantine model of the 10th century. This was an oblong rectangle with three apses on the eastern end of the building. The churches which were soon afterward built in the district of Kiev and in the two other church districts, Novgorod and Pskov, and Vladimir-Susdal, are all on the same style with only slight modifications. Both the churches in the district of Kiev and in the district of Vladimir-Susdal had the plan of a rectangle, which was almost square, and the form of a cube with two or three apses on the eastern end and a "drum" attached to the semi-circular cupola in the middle of the building. The churches of the northern district, Novgorod and Pskov, were slightly different. They were polyhedral structures with the same system of cupolas in the centre, which was the general characteristic of the churches of the Peloponnesus and the Grecian Archipelago. The number of cupolas varied in the three districts from two to five. The "drum" was later changed, giving the cupola a belly-shape. However, only the stone churches built in residences of dukes in great cities and rich monasteries bore the Byzantine character. The wooden churches, of which there were many in the three church districts, were typically Russian. They were the work of Russian peasants and were built like the *izba* (hut) with the roof sloping down on both sides. The Russian churches began to lose their distinctive Byzantine character when Russian architecture came under the influence of the Italian Renaissance. The Lombard style had made itself felt already in the Vladimir-Susdal period. When Moscow became the capital, Fioraventi and other masters were called to Moscow at the close of the 15th century to erect there churches and public buildings. Though the churches of Vladimir were taken as a model, the churches assumed new characteristics with the ascendancy of Moscow. Instead of the elementary type of belfry consisting of one or two arches covered with a simple span roof, lofty and elaborate bell towers decorate the Russian churches after the 15th century. Though churches of the Byzantine style still continued being built during the 16th, 17th and 18th centuries, the new type begins to appear in the middle of the 16th century. This type resulted from the combination of the Italian element and the national Russian style of the wooden churches. A great number of these churches appeared in Moscow in the middle of the 17th century. They were structures of unusual beauty which betrayed the originality and rich fancy of the Russian architects. The different models of the new style can be classified in three groups. The characteristic of the first is the tent-shaped roof

of different styles. The second group are churches whose main body is a long parallelo-piped, ending in two or three tent towers. The churches of the third group are cubes ornamented with domes varying in number from two to five.

At the end of the 17th century Russian architecture begins to come under the influence of West-European styles. The churches of that time have the old-established form with the decorations of the baroque style then prevalent in western Europe. The innovations of Peter I reflected in architecture just as well as in anything else a German taste, which, however, with the accession of the patriotic Empress Elizabeth was abolished in favor of the French. It was not until the middle of the 19th century that attempts were made to rescue native architecture from its peril. The first Russian architects who came into prominence only during the reign of Catherine II were A. Kokorinov, a pupil of Count Rastrelli, then in Russia; V. Bajenov and I. Sfarov. There was, however, yet no attempt made to restore distinctly national features in architecture. All of them had studied the pseudo-classical style and applied it to their productions. At the time of the construction of the Kazanski Sobor (cathedral of Kazan), which took place under Alexander I, the so-called imperial style was in vogue in Russia. This was the style which had developed in France under Napoleon I, who tried to compete in splendor with the emperors of ancient Rome. A great number of Roman porticos, frontals, façades, supported by colonnades, vast vaults in imitation of ancient rotundas and temples appeared all over in Petrograd and Moscow. The best illustration of the imperial style is the Stock Exchange in Petrograd, which is the production of the Frenchman, T. De-Tomon. Vas. Stassov, who had reached great prominence during the years 1820-30, devised a plan in which the Latin form of the cross and the decoration of the imperial style, five cupolas, were combined. This combination made the structures resemble the ancient Russian churches. Architectural activities were greatly spurred under Nicholas I, who was a great lover of art. However, the freedom of the artist was greatly hampered as architecture assumed an official character. The greater number of state and public buildings were constructed at the order of Nicholas I who entrusted with this work mainly Ton and Brullov. Russian architecture is indebted to Ton for the revival of its national element and his first attempt to restore it by turning the attention of the Russian architects to old Russian art. The tendency to return to the Byzantine and ancient Russian styles became more pronounced under Alexander II when the new spirit of reform allowed greater freedom in art.

The embellishments of the churches were mosaic works, frescoes and ikons which represented saints and prophets, complete episodes of the life of Christ and the feasts of the Byzantine emperors.

Iconography was for a long time strictly Byzantine in character. The first sacred pictures were imported into Russia from Byzantium. The earliest ikons at Novgorod and Kiev were productions of Greek painters.

There practically was no school of native painters until the 12th century. The teachers in the schools were Greek masters and the Russians who studied with them only copied the Greek style. Soon, however, as early as the 13th century, Novgorod, one of the centres of iconography, began to produce painters who showed ability and originality. The Russians, however, never reached any great distinction in this art, being hindered in their development by the restrictions imposed by the Orthodox church. Despite the efforts of the ecclesiastical authorities to keep this art within the limits of tradition, the schools of Moscow and Tver began from the 17th century onward to be influenced by Western tendencies. The school of Pskov showed Italian influence already in the 16th century. Iconography lost much of its national character. The style of the Novgorodian school, the leading style until far into the 15th century, which was remarkable for its vividness and touch of naturalism, and that of the Pskov school, which differed only in peculiarities of coloring, lost many of their good qualities with the ascendancy of Moscow. The art of iconography became poor and remained undeveloped.

The decorative art on the whole dates from very early ages. At first it was only an imitation of the Byzantine but later in the 16th and 17th centuries, under foreign influence, it formed a peculiar style of its own, marked by an astounding originality, diversity and beauty. It combined West-European, Asiatic, Byzantine and national elements. The most characteristic Russian designs are geometrical patterns and fanciful representations of birds, animals and floral motifs. A very common style is that of climbing plants, such as vine, or ribbon-like strips interlacing in fanciful ways, forming different angles and ending with griffons and other fantastical animals and even human faces. Usually more than one color is used.

In the beginning of the 18th century due to the reforms of Peter I, Russian art assumed distinctly foreign character. Peter I, believing in the usefulness of art, sent a good many men for training abroad and also invited to Russia foreign masters, such as Trezzini, Brandt and K. V. Rastrelli, Sr. Though Elizabeth was patriotic and preferred everything Russian, she was compelled to invite foreign artists, such as De Rotarri, for there were yet no prominent Russian artists, due to inadequate means for good training. Later in 1757, at the suggestion of Shuvalov, an academy of art for the training of native artists was established. However, Russian art continued to be imitative in character, for the teachers at the academy were foreign artists. Moreover, the most gifted pupils of the academy were sent abroad for six years to complete their studies there.

The history of modern Russian painting dates from the establishment of the Russian school of painting which practically begins with A. Losenko. He received his training in France, and as professor and, later, director of the academy, he is greatly responsible for the foreign direction which Russian art took and preserved for a long time. The close imitation of ancient forms and Italian art of

the times of the eclectics, conventionality in colors and observation of prescribed rules made Russian work of art of those days betray poor fancy and routine. The artistic productions of Losenko's followers lack originality and national character. They treat themes from holy history, ancient history, mythology or allegory, represented on the French or Italian style. Rarely were themes taken from Russian history. G. Ugriumov and A. Ivanov, the teacher of Brullov, rank as the first prominent Russian historical painters.

The first to part with the traditions of the academy was Brullov, whose picture 'Last Days of Pompeii' appeared while the pupils of Ugriumov still strictly adhered to academic classicism. Though the 'Last Days of Pompeii' combined classicism and romanticism, then prevalent in western Europe, it threw off the shackles of academic routine and first opened the way to free creation. Next to Brullov the path of freedom in artistic production was entered upon by P. Basin and Th. Bruni. Russian art became more successful with the artists' disposal of ancient gods and heroes for the sake of episodes from ancient Russian history, which they treated in a simple and natural way. This change marks the beginning of the "National Historical Genre." The originators of genre were graduates of the academy during the years following 1860. The most famous of these were P. Chistyakov, G. Myasoyedov, N. Shustov, K. Flavitzki, H. Litovchenko, K. Makovski, V. Shvartz, N. Ge, V. Jacobi, V. Perov, U. Rilpin. The first to attempt genre was A. Venetianov. The subject matter of the genre style were pictures from everyday life, such as 'Evening-Meetings,' 'A Hunter with his Flock,' 'Travelers Caught in a Storm,' 'Scenes of Provincial Life.' In the 18th century portrait painting became very prominent and there was almost no painter of genre who did not paint portraits also. At a time of growth of wealth, followed by vanity on one hand and servility on the other, there was a great demand for portraits. And such artists as Kozlov, Ugriumov and A. Rimov responded. After Brullov's death Zarianko and Nakarov ranked as first portrait painters. Though after Venetianov the realistic painters began to produce portraits depicting Italian and Eastern life, nationalistic ideas had penetrated the public and they demanded the representation of the real life of their native country. The realization of this ideal in art was made possible by the reforms achieved by Alexander II. The first to respond to this public demand was P. Fedatov, a fine observer and witty satirist, who very successfully represented both the funny and the sad sides of contemporary Russian life. The realism of genre assumed a journalistic character. Its purpose was to attack and correct social defects. Art of the genre style, just as well as literature and politics of that time, was to play a part in bringing about reforms. The interest of the public backed this tendency. Famous artists of this group formed in 1872 a "Society of Movable Artistic Expositions" to bring to the attention of the public the existing social and political evils.

Genre was followed by landscape painting. At the head of a great number of landscape

painters stands Schedrue whose influence on this phase of painting would have been still greater, if he had not spent a great part of his short life abroad painting Italian sceneries of the Neapolitan coast. A famous contemporary of his was M. Ivanov. The most prominent landscape painter, however, was Th. Alekseyev whose specialty was perspective views of large cities. Russian landscape painting was at first, in the 18th century, only an imitation of foreign models. Following the foreign artist, the Russian painters did not depict nature as it actually is, but represented it perfectly lifeless, depriving it of all its contingencies and defects and giving it an artificial coloring. The Russian landscape painting, however, gradually lost its conventional traits, and during the reign of Alexander II assumed a national character. I. Shishkin reproduced the native forests; V. Onlovski painted Russian fields, seas and groves; M. K. Klodt depicted his native villages. However, Russian landscape painters did not escape the influence of decadence and impressionism of western Europe, which of late made itself felt in the Russian landscape.

Engraving sprang up together with the introduction of printing in the middle of the 16th century. At first wood engraving was not a separate art, wood cuts being used merely for the illustration of prayer books and other religious books, but later, in the 17th and 18th centuries, it developed into xylography. Though this art was practised in Russia for 150 years, no great artistic work was produced, and it later degenerated into plain factory work.

Metal engraving began in Russia as early as the 12th century, when it was first used for the decoration of evangelic books, cases of ikons and of different articles for church and home use. Copper plates, however, were first used in Moscow only in 1647, the engraving being made after the drawing by Gregory Blagoushin. The art of engraving was studied in Orouzhenaya Palata (school of the Orouzhenaya Palace), and the graduates of the school, artists like A. Gerkov, G. Kachalov, E. Vinogradov, were masters of their profession who in the excellence of their work could easily compete with the best foreign engravers. The most famous Russian engraver was E. Chemesov, a pupil of Schmidt. The art of engraving was already declining when Peter I, who liked to see his heroic deeds and accomplishments perpetuated, called to Russia foreign masters to train Russian engravers, and in the 18th century a great many engravings were produced, which were pictures of court life or portraits of high personages. In the beginning of the 20th century the themes of the Russian engravers were also historical subjects and landscapes. With the invention of photography and the revival of wood cuts in 1840, metal engraving went out of existence. Only *eaux-fortes* was continued in which Russian artists had become interested in the 19th century when water-coloring was much appreciated in western Europe.

Sculpture practically did not exist until the time of Peter I, for statues of religious personages with the exception of that of Saint Nicholas were forbidden by the Orthodox Church. In modern times it has been only an imitation of Greek sculpture deprived of all

national characteristics. Within the last century there has been a tendency to rid it of the classical traditions, but with little success. Even in the works of prominent sculptors like Antokolski who reproduced mainly Russian historical persons and episodes of Russian history, the classical element is quite prominent.

With the exception of sculpture all phases of art have been developing in Russia along nationalistic lines since Alexander II. In recent years a regeneration of Russian art took place, the religious aspect becoming in it very prominent. Art became permeated with ideals such as expressed by Tolstoi in his "What is Art," where he states that the task of the artist is to express in his creations his highest and best sensations; and sensations are highest and best only when they coincide with the religious conception of goodness. Not beauty but goodness is the underlying idea of art, and the purpose of the artist is to convey it to others. The ideals of great modern artists, such as the Jew Antokolski, the naturalist P. Troubetzkoi, and the realist Vereschagin coincide with Tolstoi's religious revelry. The later's war pictures agitate against war as anti-Christian.

7. RUSSIAN ARCHITECTURE. The most cursory survey of the history of Russia, as summarized in the article Russia (q.v.), should suffice to explain why Russian architecture is not comparable in extent and importance with that of western Europe, on the one hand, or of the great Moslem and Indian empires on the other. Not until the 9th century does Russia appear as a recognizable entity, and until the 16th the chaos of peoples and political institutions, the conquest by the Mongol Khans in the 13th, the incessant struggles of rival princes, kings or tsars against the Khans and against each other, the complete absence of any racial or national unity, the lack of roads and the dense ignorance of the masses, made impossible the development of any real civilization out of which alone a great architecture could spring. The first civilizing influence was the conversion to Christianity in 988 of Saint Vladimir

the Great, who made Kiev the seat of a metropolitan of the Greek faith, and brought the empire under the Byzantine influence. At the end of the 14th century, however, Moscow emerged as the political and religious capital of Russia, was enriched with churches and palaces of great splendor, especially in the citadel called the Kremlin, and remained the capital under the early Romanoffs until in 1703 Peter the Great built his new capital Saint Petersburg (now Petrograd) upon the Neva and began the imposition upon his empire of Western ideas and Western architecture.

We may accordingly divide Russian architecture into two main periods; the first from about 1389 to 1703, occupied chiefly with the erection of ecclesiastical buildings in a style derived from the Byzantine; and from 1703 to the present time, during which period the churches with some exceptions have continued to be built in the Russo-Byzantine style, while palaces and civic buildings generally have followed the modern neo-classic tendencies. Moscow is the important centre for examples of the first period, Petrograd for those of the second; but cities like Kiev, Nijni-Novgorod and Yaroslavl also possess interesting examples of both.

In all Russian architecture there is an element of semi-barbaric Asiatic taste, which imparts a distinct character alike to the older and the newer monuments. This is especially conspicuous in the Kremlin or citadel at Moscow, within whose nearly triangular enclosure is an extraordinary group of churches, cathedrals (for in Russia there may be any number of cathedrals in one city, dedicated to different names or saints), towers, convents, palaces, museums and an arsenal; the earliest buildings dating from the late 15th century, the latest from the middle of the 19th century. The fantastic turrets, lanterns, bulbous domes, gilded and brilliantly colored roofs, and singular decorations suggest a mixture of Tartar, Byzantine and Italian Baroque influences, while in some churches the multiplied repetition of certain details suggests even the Brahman monuments of India.

The religious monuments of the First Period are best studied at Kiev and Moscow. The earliest churches, built of wood, are no longer standing; the first church of stone and brick, that of the Tithes at Kiev, built in 989, has also disappeared. While parts of some existing churches may date as far back as 1020-37, as in the cathedral of Saint Sophia at Kiev which has 15 domes and whose interior retains very ancient mosaics of Byzantine style, nearly all have been so often rebuilt entirely or greatly altered in much later years that little is to be seen that is older than the late 15th century. The churches are all built on a small scale of parts, often with four interior piers forming nine bays, each covered by a domical vault or a very lofty lantern or drum carrying a bulbous dome, or a spire tipped with a huge bulbous final. These lanterns are the extreme development of the late Byzantine dome on a drum seen in the churches of Salonika and Athens, and reach the extreme of fantastic extravagance of splendor in the cathedral of Saint Basil (Vasili Blajenoy) just outside the Spasskaia Gate of the Kremlin at Moscow, built 1554 by Ivan the Terrible, with eight lanterns and a huge central spire. The Uspensky Cathedral

at Moscow (cathedral of the Assumption) rebuilt in 1473 by Fioraventi of Bologna has five simpler domes; the church of the Devitchy convent in the Kremlin has five bulbous domes. Of secular buildings of this period the most striking at Moscow are the Ivan Veliki tower of Ivan the Great, finished in 1600 by Boris Godunov, the tower over the Spasskaia Gate, and the Granovitaia or lesser palace, 1473-90, by Italian architects in the Renaissance style, but restored in 1882, and now serving as a banquet hall.

Of the Second Period the chief examples are at Petrograd. The civic buildings comprise the Admiralty (1727-35), the famous Winter Palace by Rastrelle (1732), the Stroganov Palace by the same, the Tauride Palace by Starov (1783), the Imperial Library by Sokolov (1794-1830), the National Museum by Rossi (1819-25) and the Alexandra Theatre (Rossi, 1832); nearly all these in a Russianized version of the Italian Baroque, in many parts displaying, especially in the interior decorations, the mixed Russian inheritance of Byzantine and Asiatic taste for showy effects. The Hermitage, by von Klenze, is in the neo-Greek style, more restrained in composition and detail. But the two most striking monuments are the two cathedrals: that of the Virgin of Kazan by Woronikine (1801-11) in classic style with a bronze dome and semi-circular colonnade, and the impressive cruciform cathedral of Saint Isaac by de Montferrand (1819-58) with a vast iron dome, and internally splendid in its finish of marble and malachite; it is in a strictly classical style, and is reputed to have cost \$15,000,000. The cathedral of Saint Vladimir at Kiev is a more recent work in the Russo-Byzantine style, by Beretti and Bernhardt. Consult 'Monuments de l'architecture russe' (Saint Petersburg 1895-1900); Viollet-le-Duc, E., 'L'Art russe' (Paris 1877).

Professor of Architecture, Columbia University.

8. RUSSIAN MUSIC. The music produced by the Russian people, whether in the form of the primitive and spontaneous folk-songs or in the various art forms developed by individual composers. It includes, in other words, all the music possessing sufficient Russian characteristics that has sprung up on Russian soil or that has been composed by Russian composers, whether in the strictly nationalist spirit of Glinka and Dargomyzhsky or in the more Western vein of Rubinstein and Tchaikovsky.

The historical development of Russian music reflects, in a large measure, the vicissitudes of Russia's general and cultural evolution. In her musical evolution, as in her general history, Russia has had her centuries of semi-Asiatic seclusion, her sporadic waves of Western influence, her periods of vigorous nationalism, and her days of cosmopolitanism or eclecticism. While it is manifestly impossible to draw exact parallels, it will greatly help the reader to grasp the general outlines of Russian musical history to bear this analogy in mind as he reads this article.

There are various ways of dividing and subdividing the periods composing Russia's musical history. Four general divisions are perhaps as logical as any. These may be desig-

RUSSIA

The Cathedral of Saint Basil, Moscow

nated as (1) *The Primitive Period*, (2) *The Byzantine Period*, (3) *The Period of Transition*, and (4) *The Modern Period*. The first embraces Russia's musical history from earliest times to the introduction of Christianity; the second, the seven centuries following that significant event; the third, the 18th century; and the fourth, the great period from Glinka to the present day.

The Primitive Period.—Although the limits of the earliest period of Russian music cannot be determined with any definiteness, it is known to have been a long and important one. There is abundant circumstantial evidence to show that music figured considerably in the life of the Wends (Slavic tribes of the Western group) as early as the 6th century. That it was known to and practised by other Slavonic tribes much earlier seems quite probable. Early chronicles, and especially the numerous epic songs of Russia (the "byliny"), prove conclusively that, in peace and war, music never failed to thrill the primitive Slavs, whose greatest pleasure it was at home and on their wanderings.

The period of ancient Russia music, like the earliest beginnings of music generally, comprised chiefly songs—folksongs—whose professional promoters were the "Skomorokhi," those wandering minstrels ("Merry Andrews," the Russians fondly called them) who were both the composers and the preservers of Russia's precious old songs and epics. This early band of minstrels, which included the great Bayan, seems to have branched out later into several divisions, each performing a somewhat different musical function and all having their modern—naturally much modernized—representatives in Russia to this day. Originally, however, there were only two classes of these wandering musicians: straight musicians, who sang or played on the primitive Russian harp, "gusslia," and those who did other than musical stunts (like juggling) for the diversion of the people. As the latter were called by the name "Skomorokhi" (a word of dubious origin and etymology), there came in the course of time to be many kinds of Skomorokhi, corresponding to their diverse ways of entertaining. Without enumerating all these, it may be well to add, before dismissing this part of the subject, that these wandering minstrels either sang the legendary or heroic songs of ancient Russia, played for dancing, or acted as buffoons or entertainers. That they were much more than a transitory factor in the life of ancient Russia is shown by the fact that, despite centuries of persecution by the Byzantine Church, none of the general types of Skomorokhi ever became quite extinct. The bards ultimately became poets or poetasters; the musical performers developed into orchestral musicians; while the crude entertainers eventually became regular actors.

So much for Russian primitive music and the musicians who performed, preserved and developed it. The third factor to be considered in this part of our survey is the subject of primitive Russian musical instruments. There were many of these "folk-instruments," whose origin is as obscure as that of the Russian folksongs themselves. Owing to Russia's long isolation from cultural (Western) influences, as well as

to the ban put upon folksongs and secular instrumental music by the Protestant Russian Church, Russian musical instruments were not developed and perfected as were those of western Europe. The most important of them were: (1) **STRING INSTRUMENTS**—the *gussli* (several varieties of horizontal harps, having from 7 to 13 strings), the *dombra* (a guitar-like instrument), the *bandura* (a large instrument having 8 to 20 strings, which has supplanted the more primitive *kobza*), and the *balalaika* (a triangular, long-necked instrument having originally two but now usually three strings); (2) **WOODWIND INSTRUMENTS**—the *shalaika* (a reed pipe with six sound stops), the *svirel* (a very simple piped instrument), the *surna* (a shrill pipe of Oriental origin), the *rozhok* (a simple horn-shaped instrument with six stops), and the *dudka* (a form of bagpipe); (3) **PERCUSSION INSTRUMENTS**—the *buben* (tambourine), the *lozhki* (wooden cymbals) and the *nakry* (kettle-drums). Most of these primitive instruments are still used in provincial Russia, and many of them have been so far perfected as to become orchestral instruments. The most notable instance of such use in very recent times is V. V. Andreyev's, in his famous Balalaika Orchestra (composed of some 30 pieces of the kind just described, without any bowed instruments), which has toured both Europe and America, rendering mostly Russian folksongs or music of a similarly light and simple character.

The Byzantine Period.—The highest development of the primitive national period of Russian music—the great folksong period—was reached toward the close of the 10th century, in the reign of Vladimir I (980–1015), the first Christian prince of Russia. With the introduction of Christianity into Russia, a long period of decadence set in for Russian folksong, as for all other kinds of national popular diversion and entertainment. The priests of the new faith, in a spirit of truly mediæval asceticism, waged relentless warfare against the un-Christian spirit of the Slavonic songs and legends they found in the land of the erstwhile pagans. Watching zealously over the social and domestic life of the newly converted nation, the Byzantine Church proscribed all folk-singing and persecuted its protégés, the Skomorokhi. But so dear were these folk-melodies to the hearts of the Russian people that even such constant persecution, much as it hindered their national development, could not entirely arrest their growth. It was those very Skomorokhi, or gleemen, whom we have just mentioned, that kept alive the spirit of folksong in Russia during centuries of Christian persecution. Taking refuge in the woods and remote villages, these wandering minstrels entertained and diverted their eager audiences pretty much as of old. The rich Russian nobles, moreover, persisted in maintaining, openly or secretly, their customary retinues of minstrels, despite clerical bans and displeasure. But, in the course of time, a new kind of song developed, a kind of song in which the earlier pagan sentiments were tempered with Christian. Being less spontaneous than the earlier folksongs, this curious conglomeration—and it seems to have been no more than that—was neither as pure nor as musical. With this de-

terioration of song came, naturally, a deterioration of the minstrels who sang it. The "spiritual" songs which the Russian gleemen seem to have invented at this time were neither a thing of beauty nor a joy forever. They were frankly and patently a substitute—and a very poor one at that—for the primitive but delightful folk-tunes, which were to remain submerged for centuries.

But the influence of the Church of this period on Russian music was not only negative. The Byzantine priests brought with them from the East a number of old church songs. In the 11th century, too, Greek singers introduced the Greek musical system into Russia. Soon music schools sprang up in various parts of Russia—at Smolensk, at Novgorod, and elsewhere—in which this system was studied and popularized. Gradually interest in church music spread, and the laity also learned to know and care for it. In the 12th century, if not earlier, efforts were made at chanting, which in the early days constituted the whole of the liturgic music. This was modeled more and more upon the famous Gregorian chant, while parallel texts accompanied the music notes—one in Greek and another in Slavonic (church Slavonic, to be sure). The Greek and Slavonic systems of notation, too, were long rivals, the former prevailing well into the middle of the 13th century. The greatest promoters of church music in Russia have been its tsars, who have maintained regular church choirs ever since the 15th century. It was out of these church choirs, constantly improved and augmented, that finally developed the now world-renowned Choir of the Imperial Chapel.

Among those who had done most to develop and perfect Russian church music were M. S. Beriozovsky (1745–77), perhaps the greatest Russian composer of sacred music; D. S. Bortiansky (1751–1825), a most gifted composer, who has done more than anyone else to perfect the above-mentioned Imperial Chapel Choir and whom the Russians have aptly named "the Russian Palestrina"; A. Lvov (1799–1836), composer of much meritorious music, but especially famous as the author of the Russian national anthem, and Degtiarev (1766–1813), composer of much interesting church music as well as of the secular oratorio, 'The Deliverance of Russia in 1612.' Excellent collected editions of liturgical music of the Russian Church, variously harmonized, have been published at Petrograd under the auspices of the Imperial Chapel. Two ancient musical grammars, published in facsimile, are also available. There are any number of works on the subject of Russian church music.

The Period of Transition.—The salutary influences of church music just referred to came long after the Byzantine period. They were mentioned under the preceding section merely for completeness. As a matter of fact, the dominance of Byzantine music in Russia ended soon after Western influences began to reach it, first through Kiev in the 17th century and next through Saint Petersburg in the 18th century. It was in the reign of Tsar Alexey Mikhailovitch (1645–76), Peter the Great's father, that the influx of foreign culture into Russia first began. Naturally, music was among the arts affected. Following European

fashion, court choirs and orchestras came into vogue. The wandering minstrels of old (the oft-mentioned Skomorokhi), hitherto banished and persecuted by the overzealous Church, now became regular musicians and actors. The nobility, imitating the court, also now began to maintain their private little bands of musicians. Later these would give public performances, and thus musical interest was being stimulated by various agencies. When, finally, toward the end of Alexey Mikhailovitch's reign, the old ban on folk-songs and secular music generally was lifted, the glory of Russian folk-song—much dimmed, it is true, by centuries of disuse and somewhat denatured by the long-prevalent Byzantine music—once more returned to the land.

But conditions generally did not yet favor Russia's spiritual awakening, which followed the era of Westernization ushered in by Peter the Great (1689–1725). Nor did the change come all at once even then. It was impossible for Peter's numerous reforms to make themselves felt so quickly in any field. Certainly music was one of the last things to have throbbed with the new life that then began to stir sluggish Russia. It would seem that, with the multitude of political and social reforms claiming constant attention in the reign of this sovereign, the arts suffered proportionately greater neglect. At any rate, during Peter's reign music remained but a diversion of the court—an aid to the lustre of social functions, etc.—for Peter himself is said to have found as little pleasure in opera and comedy as in the chase. His tastes were only for church music. According to a reliable musical historian (Korb), as late as 1698 music was still only an accompaniment to various occasional feasts and celebrations in the homes of nobles, wealthy merchants, and German officers residing in Russia. Native Russian musicians were still too scarce in 1702 to make up the small orchestra of the Moscow Theatre without importing men from Hamburg. And the orchestras of that day were very small. Even court orchestras did not exceed 20 instruments, chiefly brass. Nor did their musical efforts have any artistic merit. Even military music of a very crude character did not find its way into Russia before 1704, after which it came to be used at funerals. As to folk-songs, the court and society generally evinced no particular fondness for them, despite the new lease of life given to them in 1722 by Peter's ukase permitting popular musical diversions on certain Church holidays.

But greater musical progress was made in Russia under Peter's successors, Anna Ivanovna and Elizabetha Petrovna. It was under the former that Italian opera first appeared in Russia (1735). The event and date have great historical significance because they mark the beginning of a long period of foreign (chiefly Italian) operatic influence, from which Russia did not fully emerge for over a century. According to Vladimir Stasov, a famous Russian musical critic and historian, the first Italian opera produced in Russia was Francesco Araja's 'Albazar,' conducted by its Italian composer, who was court kapellmeister under both Empress Anna and Elizabeth. Other foreign operas, mostly the work of the same composer, followed in rapid succession. But

none of them had anything Russian to recommend them, although several composers tried persistently to give to their non-Russian works some Russian flavor. Thus the above-mentioned Araja produced an opera in 1755 ('Cephalus and Procius') which was written to a Russianized libretto and which was the first opera sung in Russia in the vernacular.

During Elizabeth's reign music in Russia became a fad, if not a veritable craze, every wealthy merchant aping the court fashion by organizing private musical bands and choirs. It was then, chiefly through the influence of Count Razumovsky (immortalized by Beethoven) that Russian folk tunes came into vogue again. Araja and others started to introduce them into their operas. Thus appeared for the first time instrumental music which used and artistically developed Russian folksong themes. Under such favorable circumstances, native Russian singers and even composers developed. Besides the famous composers of church music mentioned in the preceding section, there were F. G. Volkov (1729-63), the eminent Russian actor, whose opera 'Tanyuska' (said to have been first performed in 1756) was the first all-Russian opera produced in Russia; and E. P. Fomin (1741-1800), a prolific composer of operas, whose 'Anyuta' (produced in 1772) comes much closer even than Volkov's work to having been one of the precursors of genuine Russian opera. The historical importance of such compositions becomes more obvious if we bear in mind the fact that most of the foreign "operas" of those days were really only series of more or less successful musical vaudeville acts.

Still greater musical progress was made in Russia under Catherine the Great, who was the first Russian ruler to give serious attention to general musical education. In her reign the study of music was introduced into girls' schools, while a student orchestra was organized at the Moscow University. Musicales became frequent and musical clubs multiplied, both factors exerting incalculable influence upon Russia's musical development. Temporarily halted in the reign of Catherine's successor, who entangled Russia in a war with France, this development received a new stimulus from the spirit of nationalism which followed the great Napoleonic defeat of 1812. Russia was determined to shake herself free, as it were, from foreign fashions and influences, which had long hindered her independent national development, in music as in other things.

Naturally, such a task could not be accomplished all at once. Persistent and numerous attempts in this direction were made with varying degrees of success by such composers as Titov (1800-76), Aliabiev (1802-52), Varlamov (1801-51), Gurilev (1802-56), Vielgorsky (1788-1856), Verstovsky (1799-1862) and, especially, the very prolific Venetian composer residing in Russia, Catterino Cavos (1776-1840), who rendered particularly great service to the Russian music-drama. Though the musical education of most of these composers had been too German-Italian to enable them to write music that should be truly and fully Russian, the work of this group of "pre-nationalists" or "pseudo-nationalists," as it has been variously called, certainly paved the way for the great

Glinka, the first truly national Russian composer, with whom modern Russian music really began.

The Modern Period.—Hardly any period of Russian music illustrates better than the modern the principle, referred to at the beginning of this survey, that Russia's cultural and artistic development practically reflects the general course of her eventful history. The new and vigorous impulse given to Russian life and thought by the pregnant events of 1812—an impulse making for thoroughgoing nationalism—found its expression in the field of music, no less than in science, art and literature. Not only did the first quarter of the 19th century witness a still greater development of opera in Russia, but orchestral music first received serious attention and systematic study there. The great classical composers, from Bach to Beethoven, were introduced to Russian audiences between 1802-19 by the assiduous efforts of the Russian Philharmonic Society, the oldest Russian organization of its kind, founded in 1802. Besides, orchestral concerts given by various educational institutions (with the participation of their students) supplied more popular musical diversion. That the musical public grew rapidly in those days, Glinka himself tells us. The general elation caused by the sudden victory of 1812 spurred on even Russian composers to new efforts; and we have, as a result, the first Russian oratorios and songs (best done, perhaps, by the above-mentioned pre-nationalist, Titov) and the so-called cantatas of Verstovsky, another of Glinka's contemporaries, who, together with the energetic Cavos, may be said to have tilled the soil of Russian opera into which Glinka was to plant the sturdy seeds of nationalism a little later.

Although the development of Russian music in the 19th and 20th centuries has been continuous, it cannot be said to have been homogeneous. At least three distinct general tendencies are discernible in this period: (1) *the nationalist*, (2) *the Western* and what may be called (3) *the cosmopolitan or eclectic*. We shall consider each separately and in the order given, concluding with a summary view of (4) *recent tendencies*.

The Nationalist School.—The father of this great school of Russian music was Mikhail Ivanovitch Glinka (1804-57), who did for Russian music what Pushkin (q.v.) did for Russian literature, or Ivanov for Russian art. Although Glinka began composing in the German-Italian vein, he soon set his heart resolutely against foreign models and, by dint of genius, created music as characteristically Russian as has ever been done since. His two songs composed abroad in 1832 already disclosed Glinka's groping for a new musical style, and his epoch-making opera, 'A Life for the Tsar' (1836), gave further intimations of the birth of an independent national school of music in Russia. This opera, while still markedly Italian, has sufficient Russian color—it uses Russian folk tunes and is based on a Russian plot—to win for it considerable distinction as the forerunner of real national Russian opera, which began most auspiciously with Glinka's 'Ruslan and Ludmila' (1842), his masterpiece, which at once raised the status of Russian music as the equal of any in the world. This great national

opera attested to Russia's emancipation from foreign musical domination. An impressionable musical genius, Glinka reflected not only the influence of Russian folksongs, but also that of Oriental and Spanish folk tunes. In both latter fields he has wrought his *chef-d'œuvre*, introducing new elements everywhere and breathing new life into everything he utilized. Sympathetic comprehension of the spirit of Oriental music, which is so characteristic of many Russian composers, found in Glinka the first and greatest embodiment.

But Glinka was chiefly an instrumental composer. Much as he did in this field—and he actually created the modern Russian orchestra and introduced entirely new methods of orchestration—Glinka did not do much for vocal music. With this phase of musical development Alexander Dargomyzhsky (1813–69), Glinka's illustrious contemporary, concerned himself. Although Dargomyzhsky, too, began by imitating foreign musical models, he soon surpassed all these, and even Glinka himself, in the operatic field. Even his early opera, 'Russalka' (the Mermaid, first produced in 1856), surpassed Glinka's 'A Life for the Tsar' in some respects. But his later works, the uncompleted opera 'Rogdana,' and especially 'The Stone Guest' (first produced in 1872), fully revealed the great genius of this composer. 'The Stone Guest,' Dargomyzhsky's operatic masterpiece, shows all the distinctive merits of his originality. Although but a second rate instrumentalist, Dargomyzhsky made a lasting impression on Russian music. He not only perfected the melodic recitative introduced by Glinka, rendering it colorful and expressive alike of joy and sorrow, but added a lively sense of humor entirely wanting in the works of the former. With as strong an Oriental setting as Glinka's and an even stronger nationalist element, Dargomyzhsky's works really placed the keystone in the great arch of Russian music which was begun by Glinka. While he lacked Glinka's melodic inspiration and strong lyrical vein, no other Russian composer save Musorgsky (to be considered presently) made music express life so veraciously and so passionately. Dargomyzhsky was a great realist. His constant watchword was *to fit the music to the word*—each period or sentence with the musical phrase best adapted to it—and in this respect, too, he succeeded far beyond Glinka and all his early foreign masters. In perfectly blending vocal and orchestral elements so as to form a natural and inseparable whole, Dargomyzhsky took a great step in advance even of Wagner himself.

So inspiring were the great works of Glinka and Dargomyzhsky, that a whole school of Russian composers soon grew up which strove consciously to imitate and interpret them. By continued and close study of Glinka's and Dargomyzhsky's masterpieces, this group of composers—variously known as "the Balakirev Circle," "the Mighty Set," "the Invincible Band," and "the Great Five"—mastered every essential principle embodied in them and clearly formulated such others as may have lain entirely unconscious in the minds of their adapted masters. All these principles, judiciously compounded with those of West European composers, constituted the musical tenets of the Young Russian School, the true national school

of Russian composers. The leading representatives and guiding spirits of this great school were Balakirev (1837–1910), Borodin (1843–87), Musorgsky (1839–81), Rimsky-Korsakov (1844–1908) and César Cui (1835–1918). Space forbids any consideration of the musical principles which guided the work of this illustrious circle of Nationalists. As their chief mission was the radical reform of opera along the lines marked out by Glinka and Dargomyzhsky (in the field of symphonic music they accepted the work of its great Western masters), one cardinal principle may be stated to indicate their general trend. In the words of Cui himself, this was the principle that "operatic music should always have sufficient intrinsic value as absolute music, apart from the text to which it is written." "Truth and Nationalism" was their persistent battle-cry.

Of the principles and methods of this school, Balakirev was the most influential teacher, Cui the most aggressive exponent, and Musorgsky the best illustrator. The first two wrote little music, thus making the other three members of the group the most prominent composers of their school. But even though Balakirev and Cui do not rank high as composers—and the compositions of the first, especially the wonderful symphonic poem 'Tamara,' are by no means negligible—they occupy a very important place in the history of Russian music—the former as the initiator and leading spirit of the great musical school we are here considering, and the latter as the most vigorous and devoted literary champion of the principles for which it stood. Of the three others, Musorgsky was chiefly a vocal composer, Borodin an instrumentalist, while Rimsky-Korsakov worked prolifically in both fields. As they have all won universal renown, a word characterizing the work of each will not be amiss.

Musorgsky was the direct musical descendant of Dargomyzhsky, whose theories and principles he followed so faithfully that he soon excelled the work of his great master. Accepting Dargomyzhsky's musical creed concerning the realistic representation of life, Musorgsky embraced also the principle that art is a means to an end, and not an end in itself. The end, in the case of music, as in the case of the other arts, is the communication of thought. This was Musorgsky's guiding principle, which he successfully embodied in both song and opera, neither of which have ever been surpassed. His operas (especially 'Khovanstchina' and 'Boris Godunov,' both historical music-dramas) are as truly Russian in every respect as art could make them. By all means the most gifted and original composer of the nationalist school, Musorgsky has extended the bounds of musical art quite as much as did Berlioz or Wagner. Certainly no Russian composer, before or since, has done so much for musical realism. His works are not only realistic and intensely national in plot, inspiration and melodic texture, but are also veritable studies in folk-psychology, thus giving the spirit of the times as faultlessly as any historical novel. Hence Musorgsky's operas and songs, in both of which he displays truly Shakespearean insight into human nature, are human documents in the broadest and best sense of the word. Add to all this a pervading sense of musical humor—a very uncommon

quality among Russian composers—and great dramatic gifts, and Musorgsky's greatness and historical importance become obvious even to the casual student of musical history.

A far lesser genius was Borodin. Just as Musorgsky continued the line of musical evolution begun by Dargomyzhsky, the vocalist, so Borodin worked along the lines laid down by Glinka, the instrumentalist. Borodin, unlike Musorgsky and Dargomyzhsky, devoted much time to absolute music, and sedulously cultivated the older musical forms discarded by the latter. In his only opera, 'Prince Igor,' Borodin is more lyrical than Glinka and more romantic than Musorgsky. In other words, he stands somewhere between national lyricism and dramatic realism. 'Prince Igor,' however, has great melodic inventiveness, national picturesqueness, and epical charm. If Borodin's music is the most national after Glinka's, his use of Oriental melodies surpasses even his great master's. But Borodin was essentially an orchestral composer, and it is as a symphonist that he has influenced the course of Russian musical development. Yet, though a great melodist and Orientalist in color (especially in such a masterly musical picture as 'In Central Asia,' one of the mainstays of the modern concert repertoire), Borodin can hardly be ranked among the foremost Russian composers.

The orchestral development begun by Glinka and furthered by Borodin, among others, attained seeming perfection in Rimsky-Korsakov, at once the most brilliant and the most prolific composer of the Balakirev Circle. An apostle of musical beauty and a perfect master of form, this many-sided Russian composer stands supreme in the history of modern Russian music, since not even the great Tchaikovsky (to be considered in another section), equals his powers of orchestration and his epical melodic charm. Rimsky-Korsakov is, first of all, an optimist (a composer in the major key), and an objectivist. Like all the lineal musical descendants of Glinka, he uses folk-melodies of several countries, setting them off in such gorgeous color and orchestrating them with such luxuriance that one almost forgets that the resulting kaleidoscopic beauty is a work of art. Nor is it possible to say in which department, orchestral or vocal, Rimsky-Korsakov really excels. He has produced first-class symphonic music (including the universally admired suite, 'Scheherazade') and many splendid operas (including such gems as 'Snegurotcha'), besides volumes of songs, duets, choruses and cantatas. Besides being the most versatile Russian composer and the greatest wizard of orchestration, producing endless varieties of rich orchestral color, Rimsky-Korsakov enjoys the additional distinction of being the greatest Russian musical fabulist—a great "musical archeologist," he has been aptly called—for the way he draws upon folklore and legends for his enchanting opera librettos.

Manifestly, such splendid musical development as was attained by this brilliant group of Russian composers could not continue indefinitely. A period of decadence, which almost always sets in after a particularly rich flowering out of any art, naturally followed the unprecedented musical progress made by the foremost composers of the Balakirev Cir-

cle. The numerous and inevitable followers were, for the most part, uninspired imitators. Devoid of original ideas, they became a cult of mere formalists—musical rhetoricians, as it were. Thus, the representatives of the second generation of nationalist Russian composers, Glazunov (1865–) and Liadov (1855–1914), both distinguished pupils of Rimsky-Korsakov, were very skilful technicians whose musical inspiration hardly ever keeps up with their mastery of form. Of the two, Glazunov is the greater technician; Liadov, the greater melodist. Both have their followers and imitators in Russian music. Mention might be made of Shtcherbatchev, Sokolov, Ladyzhsky, the two Blumenfelds, Alferaky and others, who should be classed in the school best represented by Liadov. Among the followers of Glazunov, most prominent are Vitol, Liapunov, Gretchaninov, Kopylov, Antinov and Yestafyev. But, of course, none of these groups of younger nationalists suggest even remotely the great older generation of Russian composers in whom the great nationalist school of Russian music reached its culmination. Whether the vein of nationalism has finally run dry, or whether other tendencies have ultimately replaced it, cannot be discussed in the present article. Certain it is that the glorious illumination we have been considering in this section has not yet found its like in Russian musical history.

The Western School.—Even while the nationalist illumination was at its height, the "New-Russian School" did not have the field all to itself. Not only then, but from its very inception, this school or tendency had a formidable rival in the Western school, represented by the two Rubinsteins, Serov and others. Indeed, the Western tendency antedated the nationalist, being the more natural heir of the 18th century foreign-opera period. The struggle between the two great schools constitutes a most interesting chapter in the history of Russian music. The traditions established by the leaders of each musical camp have not entirely died out yet, though naturally the bitterness of earlier days has disappeared. There are many Russian contemporary composers who, consciously or unconsciously, represent one or the other of these tendencies; and there are some, as we shall see presently, whose eclecticism embraces both. It is impossible to enter here into the details and merits of this historic musical controversy, which raged all through the second half of the 19th century. Having already referred to the leading representatives of the nationalists, the "Mighty Five," we must now consider, however briefly, the guiding spirits of the Western school, since Russian musical history is as inseparably connected with Serov and Rubinstein as it is with the famous Balakirev Circle.

Anton Rubinstein (1829–94), who was conservative as a composer, rendered his greatest service to Russia's musical development as an educator. In a country where systematic musical education had been hitherto entirely unknown and where musical art was cultivated but by the few, Rubenstein's persistent and indefatigable educational efforts were sorely needed, if not always appreciated. It was to him that Russia owed the establishment of its first symphony concerts, the first Russian con-

servatory of music, the Imperial Conservatory of Saint Petersburg, founded in 1862, and the oldest Russian musical society, the Imperial Russian Musical Society, organized in 1859, perhaps the greatest musical organization in the world. In the teeth of much adverse criticism Rubinstein introduced into his Conservatory the principle of sound musical scholarship and broad Western musical education. His insistence on this principle alone would have embittered the members of the new national school, most of whom were neither academic musicians nor professional composers. But, of course, Rubinstein's musical tastes and predilections gave them equal offense.

Just as he looked to the West for educational guidance, so Rubinstein turned thither for musical models and inspiration. Being a classicist both by temperament and by education, he followed almost religiously the musical traditions of the school of Beethoven and Mendelssohn, eschewing and detesting all musical innovations, Wagner's no less than those of the new Russian school. Lacking in originality, however, Rubinstein remained a mere imitator as a composer; and he may not improperly be classed with one or other of the German schools of the 19th century. A truly Russian composer Rubinstein never became, though he at times used national themes and set to music several Russian texts—missing, in both instances, the essential spirit of the national elements he employed. Moreover, he was a very careless composer, and most of his works lack finish and depth. He was a very prolific composer, however, and produced many works in every musical form. Though passages of exquisite beauty and even grandeur may be found everywhere, Rubinstein's longer compositions suffer for want of sustained inspiration, artistic finish and proper proportion, profuseness being one of his besetting sins. Much as he did for Russia's musical development as an educator—and Rubinstein not only taught in his conservatory, but also toured Russia as musical conductor and piano virtuoso, giving concerts and recitals of inestimable educational value—Rubinstein did very little for Russian music as a composer. Mistaking mere ethnography for nationalism, he could never become a truly national composer.

Among the composers whom Anton Rubinstein may be said to have influenced, the most prominent were his brother, Nikolai Rubinstein (1835–81), also a great musical educator and pianist; Edward Napraynik (1839–1916), a great operatic conductor, and Karl Davidov (1839–89), perhaps the greatest violoncellist Russia has ever produced.

More important also as a musical educator than as a composer was the other prominent opponent of the Balakirev Circle, Alexander Serov (1820–71), the first well-educated professional music critic in Russia. Beginning with a series of essays and lectures interpreting the meaning of Western composers—Mozart, Beethoven, Donizetti, Rossini, Meyerbeer, etc.—and ending with his whole-hearted praise of the works of Richard Wagner, Serov did very much to spread musical knowledge in Russia. His influence on the reading public of his day was inestimable. By raising musical appreciation in Russia he did for Russian music

pretty much what the great Belinsky (q.v.) did for Russian literature. For having lifted Russian musical criticism to its professional level, a level well sustained by at least two other musical critics (Laroche and Ivanov), Serov's name deserves always to be remembered in the history of Russian music. But, being a subjective critic and by no means a very consistent one, his four collected volumes of musical criticism abound in misleading and contradictory statements, many of them made in the heat of journalistic debate, for Serov was a born and bitter controversialist.

The Cosmopolitan or Eclectic School.—Neither the strictly nationalist nor the purely Western tendency in Russian music proved self-sufficient. Rubinstein has had no noteworthy followers, while the nationalist illumination owed most of its brilliancy to such rare geniuses as Musorgsky and Rimsky-Korsakov. Whatever truth there was in the two diverse views, neither of them contained the whole truth. The golden mean in this case was found by the great Tchaikovsky, the greatest Russian composer and the foremost representative of "occidentalism" or "eclecticism" in Russian music.

Peter Ilyitch Tchaikovsky (1840–93), a pupil of Rubinstein, did not actually belong to the Balakirev Circle, though some of his works embody principles formulated by the famous "Five." He cannot properly be classed with the new Russian school, since he persistently deviates from the straight and narrow path of pure nationalism. Though Tchaikovsky undoubtedly had much in common with the Russian nationalists, his artistic tastes and leanings were too Western to be confined within the narrow bounds prescribed by nationalism. Thus it came about that in Tchaikovsky these two musical tendencies were happily combined.

Like his great contemporary, Rimsky-Korsakov, Tchaikovsky was a very prolific composer, having created numerous works in every field of musical composition—orchestral, operatic, song, chamber music, concertos, etc. It is as an orchestral composer, however, that Tchaikovsky's genius shows to greatest advantage; and it is as a symphonist that he ranks among the greatest composers of the world. Tchaikovsky's characteristic vein is subjective—introspective. All his symphonies but one are written in a minor key, while the three greatest are pervaded by a tone of intense struggle and revolt. If Rimsky-Korsakov may be described as a musical optimist and an objectivist, Borodin as an epical composer, and Musorgsky as a delightful realist, then Tchaikovsky may be characterized as a musical pessimist and subjectivist. The lyrical vein of Glinka, whose musical heritage he, naturally, shared, finds its highest expression in Tchaikovsky. The spirit of folksong, which pervades the best melodies of Rimsky-Korsakov, yields in Tchaikovsky's typical music to sombre themes steeped in introspection. Technically and temperamentally he is an uneven composer, resembling in this respect the less gifted Rubinstein. While Tchaikovsky's rhythms are often capricious, his melodious vein seldom runs dry, and his rare elegaic charm remains forever fresh, while as a master of orchestration he is second only to Rimsky-Korsakov.

Just as the nationalist school of modern Russian composers reached its highest development in Rimsky-Korsakov, its most brilliant representative, so the cosmopolitan or eclectic school attained its greatest glory in Tchaikovsky, its most illustrious composer. In neither case have followers or disciples sustained the splendid attainments of their great masters. The followers of Tchaikovsky are quite numerous. They include Arensky (1861-1906), a fairly interesting melodist and a skilful harmonizer; Kalinnikov (1866-1900), a very promising symphonist who died all too soon; Ippolitov-Ivanov (1859—), a great connoisseur of Caucasian and Semitic melodies; Taniev (1856—), a composer best known for his chamber music, and Rakhmaninov (1873—), the greatest and most promising follower of Tchaikovsky, if not the foremost living Russian pianist and composer.

Recent Tendencies.—Many and varied are the new tendencies that have appeared in Russian music since the days of Tchaikovsky and Rimsky-Korsakov. As these practically coincide with the beginning of the present century, they are all too new to have reached any very definite development. It is, therefore, as impossible to label such tendencies as it is to classify the contemporary Russian composers into "schools." The necessary historical perspective is altogether wanting for such a task. All that can safely be attempted in this article is a very general outline of such few tendencies as seem most pronounced and unmistakable at this writing.

It seems to have been inevitable that the world-wide radical tendencies—"impressionism," "futurism," and what not—prevalent in music, as in art generally, since the close of the 19th century, should have found their way into Russia. At any rate, we have in recent Russian music unmistakable echoes of Debussy, Ravel, and Dukas, in France, and of Reger, Richard Straus, and Schönberg, in Germany. The three chief representatives of these new tendencies in Russia are, Skriabin (1872-1915), Stravinsky (1882—) and Prokofiev (1891—). Of course these three names do not exhaust the list for Russia any more than the preceding ones exhaust those of France and Germany; but a brief characterization of the work of these more eminent ultra-modern Russian composers will indicate the general direction their numerous imitators are taking.

Skriabin, whose earlier compositions are delightfully Chopinesque, passed through a period of Liszt-Wagnerism before becoming the musical extremist for which he is known the world over. Thus it is in his last period that Skriabin showed his unmistakable impressionism. Becoming more and more independent as a composer, he introduced more and more revolutionary ideas into his works. For instance, in his symphonic poem, 'Prometheus,' the composer tries to prove the fancied relationship between sound and color by introducing what is known as "the color-keyboard." This experimental fusion of auditory and other sense-impression was to be carried still further in a symphonic poem which would utilize perfume as well as color, but Skriabin's premature death prevented its completion. There is no telling what course this original composer would have taken next, had he lived longer.

Less of a musical theorist and more of an impressionist than Skriabin is Stravinsky, whose great originality asserted itself from the very first ('Scherzo Symphonique'). More than any other Russian composer, Stravinsky resembles Debussy and Schönberg. Proceeding to assert himself in subsequent compositions, he soon came to be generally regarded as the foremost "Futurist," which meant that Stravinsky had gone somewhat beyond legitimate impressionism.

Harder to classify than either Skriabin or Stravinsky is Prokofiev, the youngest of the three and seemingly the most immature. Decidedly under the influence of Schumann and Brahms, he yet shows unmistakable traces of Reger. Though having little in common with Stravinsky's general musical manner, he yet reveals internal traits strongly suggestive of his futurism. Prokofiev, evidently, has not yet found himself.

The only one of these composers whose followers can be said to have formed a new school is Skriabin. In both Petrograd and Moscow there are innumerable budding composers who try to ape Skriabin's compositions, a task far beyond mediocrity. Of these imitators—and to some extent of all the impressionists and futurists—it may be said that their principal shortcomings are the lack of thematic invention and solid musical scholarship. Disregarding fundamentals and seizing upon accidentals, these ultra-moderns worship musical form above spirit and substance, seeking dissonance instead of consonance. The great advance made in modern orchestral technique enables these composers to hide a woeful paucity of musical ideas under much belabored orchestration. The result, in most cases, is much ado about nothing.

Bibliography.—Considering the very important place Russian music now occupies in the concert halls and opera-houses of at least two continents, it is more than surprising that there should be such a scarcity of literature on the subject in West European languages. In English this dearth is particularly disconcerting. Apart from periodical literature, which cannot be listed here, five more or less comprehensive works (two by the same author and two in translation) are practically all that is available in English at this writing on the subject of Russian music generally: Cui, César, 'A Historical Sketch of Music in Russia' (in Century Library of Music, Vol. VII, New York 1901); Montagu-Nathan M., 'A History of Russian Music' and 'Contemporary Russian Composers' (both London 1914 and 1917, respectively); Newmarch, R., 'The Russian Opera' (New York 1914); and Pougin, A., 'A Short History of Russian Music' (ib. 1915). In French the list of such works is just as short. Besides Pougin's history, already mentioned in its English translation, the reader of French will find the following variously interesting: Bruneau, A., 'Musiques de Russie et Musiciens de France' (Paris 1903); Marliave, J., 'Musiciens Russes' (In 'Études Musicales,' ib. 1917); and Soubès, A., 'Histoire de la Musique en Russie' and 'Précis de l'Histoire de la Musique Russe' (both Paris 1898 and 1893, respectively).

The most critical and comprehensive Russian work on the subject is Berizovsky's (Saint Petersburg 1898). There are, besides, a very admirable series of essays by Engel (Moscow

1911), a good historical sketch by Kashkin (ib. 1908), and that most authoritative if not unbiased sketch by César Cui mentioned above, which is available in French as well as in English.

Of course, there is no end of literature treating of various phases of the subject. But limitations of space preclude all special and classified bibliographies, which may be found elsewhere in this and other reference works.

9. EDUCATION IN RUSSIA. Educationally, as in other respects, Russia has long lagged behind the more progressive countries of both Europe and America. Neither in their extensity nor in their diversity can the schools of Russia compare favorably with those of Germany, England or the United States.

History.—Russia had no schools worth mentioning before the end of the 14th century, when the southwestern part of the country came into contact with Western civilization. Then, for the first time, well-organized schools appeared in Russia. But these were in no sense national schools—and were not intended for the general public. It was not before Peter the Great, three centuries later, that Russian schools assumed Western characteristics. Up to his time all schools and schooling had borne a decidedly ecclesiastical character and depended wholly upon the clergy; but during this monarch's reign Russian education was secularized, extended and rendered more practical. Under subsequent monarchs there were various periods of bitter struggle between educational autonomy and state autocracy, induced by the shifting political aspects of the times, until the Great War and the proclamation of the Russian Federated Republic inaugurated a new educational era.

The Minister of Education appointed by the provisional Kerensky government, Ignatiev, was a progressive educator, who planned many educational reforms for Russian schools—including the elective system, the professional training of teachers, etc. But these and other important educational projects were halted by the Civil War into which Russia was plunged by the Bolshevik coup d'état of 1917, and naturally await the settled conditions of peace for development.

Organization, Etc.—For educational purposes monarchical Russia was divided into 15 districts, with the Ministry of Public Instruction as the supreme central authority. The Holy Synod exercised considerable control over primary schools, while the ministries of War, Marine and Finance maintained their own educational departments for the management of military schools, naval academies and commercial institutes. Save in the Lutheran parishes of the Baltic provinces, education in Russia was neither universal nor compulsory. Although under the Primary School Law of 1864 children of every rank, race and creed were to be admitted to primary schools controlled by the state, not more than one-sixth of the children of school age could be accommodated in Russia for lack of school facilities. Hence the low average literacy—about 21 per cent through the former empire. The course of study was extended in 1872 to three years for ordinary

and six years for urban primary schools, the latter including history, geography, geometry, the elements of physics, science and singing, besides the inevitable three R's and such special subjects as were approved by the Minister of Education. The actual support of primary schools devolved upon the central government, local authorities and private societies, as the case might be. Certain Sunday schools, supported by private funds, also carried on regular primary work with the approval of the Minister of Education. There were besides, many denominational schools engaged in secular teaching throughout the country which were similarly authorized. Before the World War there were, all told, about 126,000 primary schools in Russia, with a total enrolment exceeding 8,264,000 pupils.

The principal schools of secondary grade in Russia before the Revolution were *Gymnasias* (classical high schools), *Realschools* (modern high schools), *Progymnasias* (junior high schools) and commercial schools. The first were intended to lead directly into the universities, while the second prepared pupils for the various technical schools. As many gymnasium students never entered the university, a new kind of secondary school—something between the classical and the modern high school—was under consideration when the war broke out. Besides these types of secondary schools there were many others—teachers' institutes, teachers' seminaries, girls' high schools ("female gymnasias"), etc. A special kind of girls' secondary school, a sort of boarding school similar to Roman Catholic convent schools, was established by Empress Maria, wife of Alexander II, which ultimately necessitated a separate educational department assuming almost ministerial rank. This particular institution is believed to have been the forerunner of numerous girls' high schools in Russia and thus promoted the education of women to no inconsiderable extent. The regular high-school course runs from seven to eight years, and in the case of girls includes no classical languages. As in the case of primary schools, many high schools are maintained by private organizations, but all are controlled or supervised by the government. The total number of secondary schools in Russia increased from 760 in 1909 to 2,050 in 1914 and the number of enrolments from 171,687 to about 685,601.

Russian universities resemble those of other countries in many respects. In imperial times they had the usual faculties of law, philology, science, medicine, chemistry, etc., but foreigners were denied admission to all but musical conservatories. Private universities were the exception rather than the rule. The social spirit characteristic of the best European and American universities has in the past been wanting in Russian universities, being replaced by intense political activity—hence the government's repressive measures referred to earlier in this article. The number of applicants for admission always greatly exceeding all possible enrolments, a stiff competitive examination precedes matriculation in Russian universities. As many university graduates land in the civil service, there was always a close connection between the proverbial incompetence of government officials and the unfortunate educational situation just referred to, which often makes

the choice of one's profession largely a matter of chance. The leading Russian universities before the Revolution were those of Moscow, Petrograd, Kiev, Kharkov, Kazan, Warsaw, Odessa, Yaroslav, Tomsk and Saratov. These had a total of 39,027 students in 1914. During the Great War a women's university was founded at Petrograd and a new university was decreed at Perm.

10. RUSSIAN RELIGION. Pagan Period.—The Russian national chroniclers have left us scanty details as to the primitive religious beliefs of the Russian tribes. Russian paganism, despite the multiplicity of its idols, rests on a monotheistic conception of the divinity. Svagor (in Sanskrit, the God coming from Heaven) is the JHVAH, the Jehovah, Jove or Jupiter of the Russian Olympus, the god of the lightning. All the other gods were born from him. The most powerful of them are the Sun and the Fire. An important divinity is Peroun, adored as the giver of rain. Stribog represents the classic Æolus. Other divinities are Siwa, the god of peace and concord among men; Tur, the god of war; Rod and the Rozhantzy, the domestic lares; Mara, the goddess of pestilence; and the Rousalki, the Russian lake and marsh nymphs.

Russia gave her divinities human form; and the national chroniclers mention the statues of Peroun, Dazhbog, Stribog, Simargl and Komosh. Temples do not appear to have been built. Their places of worship were the summits of hills, woods, the springs and occasionally rustic cabins and barns. They offered their idols sacrifices of slaughtered and burnt animals, and of bread and fruits. On supreme occasions, human sacrifices were offered to appease the wrath of the gods. The sacrifices were made not by priests, but by the princes, the chiefs of the tribes, the seniors and even by the chiefs of the families. The Pagan Russians believed to some extent in the immortality of the soul, and a life hereafter. According to their belief, souls after death were gathered in the island of Buyan, in the middle of the ocean; coming from time to time to visit their native country. The early Russians practised cremation, burning the dead in small canoes. A year after death, the souls were commemorated with funeral banquets, and other ceremonies. It seems also that the faith of Russian paganism in the immortality of the soul had an element of metempsychosis.

The religious calendar was based upon the change of seasons. The beginning of the new year was celebrated with special ceremonies in honor of Peroun and the Sun. They were called Koliady, a name derived from Latin *Kalendæ* or according to Solovev, from *kolo* (circle, the symbol of the sun), and Lada, the goddess of spring. It was replaced later by Christmas. The same divinities were honored in great celebrations at the beginnings of spring and summer. The last one was transformed in Christian Russia into the feast of Saint John the Baptist. The festival in honor of Volos, (Skandinavian Valas), the patron god of cattle, became the day of Saint George.

Russian paganism did not vanish when the Christian gospel began to be preached. It survived in the popular language, sayings, tradi-

tions, domestic life and even religious beliefs. As late as the 18th century, serpents were adored in some remote villages. Eugenius Golubinsky, the greatest historian of the Russian Church, declares that Russia was baptized in the 9th century, but not christianized.

Russian Christianity.—The history of Russian Christianity may be divided into four distinct periods: (1) The period of the metropolitans; (2) the Patriarchal period; (3) the Synodal period; (4) the Revolutionary period.

1. *Russian Metropolitans.*—The official history of Russian Christianity begins with the baptism of Vladimir Sviatoslavich in 987. This does not mean that Christian faith was ignored in Russia before that time. The national chronicles attribute the earliest propagation of the Gospel in Russia to the Apostle Saint Andrew, who after having established an episcopal see at Byzantium went to Korsun, in the province of Tauris, reached Kiev and Novgorod, preached to the Vareghs and lastly set out to Rome. The thesis, however, of the apostolicity of the Russian Church is of later origin, according to Golubinsky, and cannot be demonstrated as historically true.

The frequent relations with Byzantium and the existence of a Slavic colony in Constantinople explain, however, why a nucleus of baptized Russians is remembered as observing Christianity in the city of Kiev, at a time when Paganism dominated all Russia.

Photius, patriarch of Constantinople, affirms in his encyclical letter to the Eastern hierarchy that he sent a bishop to the Russians to convert them to Christ. At the time of Igor Riurikovich (913-945) a Christian church existed in Kiev, and after the death of this prince, his wife, Olga, according to Konstantin Porphyrogenetus, went to Constantinople, and received baptism there, probably in 954. She was, says Nestor, the first Russian woman who entered the kingdom of Heaven.

In 986, the Russian chroniclers tell us, Vladimir received the visits of the representatives of various religions; including the Mohammedans, Jews, Catholics and Orthodox Greeks. The Greek form of Christianity was his choice for a religion. He was baptized in the Greek town of Korsun, and here also he married the sister of Basil, emperor of Byzantium, Princess Anna. He became the apostle of his own people. He went back to Kiev with some Greek priests and ordered all the inhabitants to be baptized. The idol of Peroun was thrown into the Dniepr. Violence at times was employed in order to conquer Russians for Christianity. The pagans of Novgorod refused to receive baptism and had to be compelled to do so. During his whole reign Vladimir strove earnestly to spread Christianity, to build churches and to organize his kingdom on a Christian groundwork. His efforts, however, did not succeed in grafting Christianity on the Russian soul. For lack of religious instruction, the Russians persevered in the practice of paganism. The responsibility for this state of things rests upon the Byzantine hierarchy whose leaders were called to rule the new Russian Church.

The earliest period of the history of the Russian Church is a mere episode in the history of the Byzantine hierarchy. Russia was considered as a metropolitan church in the

ecclesiastical system of Byzantium. Its first metropolitan, Leon, was sent to Vladimir in 991 by the Greek Patriarch Nikolaos Chrysoberghes (983-996). During two centuries and a half (991-1237) the Russian Church had 24 metropolitans elected and consecrated by the patriarchs of Constantinople. Most of them were Greek. They naturally considered everything from the Greek point of view, wrote polemical works against the Latins and sought to keep Russian Christianity far from the influence of the Roman Church. They thwarted any attempt to expand the influence of Latin Christianity within the Russian frontiers. The 11th century marks a period of strong vitality in the bosom of the Russian Church. It is the earliest transplantation of Greek monasticism in Russia. Kiev became the cradle of Russian monks, who with Antonius and Theodosius Pechersky (who died in 1073 and 1074, respectively) and the monk Nestor, began to give a markedly national character to the Russian Church. Russian bishops strove to loosen their bond with the Greek patriarchate. Together with these attempts to establish in Russia an autonomous church, the foundation and organization of Russian eparchies went on especially in the 13th century. Their number under Vladimir was eight; after his death, and down to the Mongol invasion, they increased to 16.

The development of Russian Christianity was hampered and almost stopped by the Mongol domination, which destroyed Kiev in 1240. For two centuries, Russia was entirely cut off from any contact with Western Christianity. The Mongol Khans did not systematically persecute the Christians. They even granted large privileges to churches and monasteries. The Russian metropolitans were held in great honor at their court and were able to use their influence to ameliorate the hard lot of their flocks. But in consequence of the Mongol yoke, the moral and religious conditions of the Russian people sank very low.

In 1303 there took place the first attempt to divide the hierarchical unity of the Russian Church. An independent metropolis of Galicia was established. In 1316 Lithuania claimed its religious autonomy. These new fragments succeeded in severing themselves from the metropolitans of Moscow whose authority over the Russian Church was otherwise steadily growing, as a logical consequence of the growth of the political power of the grand princes of Moscow. The Russian Church participated in the Council of Florence in 1438. The metropolitan of Moscow, Isidor (1436-41), signed the decree of union of the Russian Church with the Roman Church, and his admission was marked by the red hat. But the spirit of Byzantine Christianity was deeply rooted in both the Russian hierarchy and people; Isidor was obliged to leave Moscow, and his successors rejected the union with Rome.

In Little Russia, on the contrary, where the Western influence was stronger, the movement toward union gained ground. In 1458 Kiev became the seat of a united metropolitan, Gregorius, who, however, went back to the Orthodox Church in 1472. The tendency toward an understanding with Rome was kept alive, like a smoldering fire, and under the political and religious influence of Poland, in 1596, gave birth to the United Ruthenian Church.

2. Russian Patriarchate.—The second period of the Russian Christianity embraces the short-lived patriarchate of Moscow. It puts an end to the dependence of the Russian Church on the Greek hierarchy. The idea of the establishment of a Russian patriarchate was a natural consequence of the downfall of the Byzantine Empire and of the growth of Muscovite Russia. Moscow was hailed as the third Rome. In 1588 Ieremia, patriarch of Constantinople, went to Moscow. Tsar Teodor Ivanovich and Boris Godounov received him with great honors and asked him to grant full autonomy to the Russian Church, and the establishment of a patriarchate at Moscow. After some hesitation, Ieremia allowed himself to be won by the promises of the tsar. Iov, archbishop of Novgorod, was elected patriarch by a council of Russian and Greek bishops, held at the cathedral of the Assumption on 23 Jan. 1589. Another council held at Constantinople in May 1590, ratified, although reluctantly, the concession made by patriarch Ieremia. The new patriarchate embraced four metropolitan jurisdictions, eight archbishoprics and eight eparchies. It lasted a little more than one century, and during this period 11 patriarchs ruled the Russian Church, namely, Iov (1589-1605); Ignatius (1605-06); Hermogen (1606-12); Filaret (1619-34); Ioasaph I (1634-41); Iosif (1642-52); Nikon (1652-67); Ioasaph II (1667-72); Pitirim (1672-73); Ioakim (1674-90); Adrian (1691-1700).

The patriarchs exerted considerable influence, both religious and political. They were looked upon as grand princes. They had their court, their dignitaries and an immense income. Filaret, the chief of the dynasty of the Romanovs, was, during his patriarchate, the real tsar of Russia. Patriarch Nikon struggles with Tsar Aleksiei Mikhailovich, seeking the supremacy of the ecclesiastical upon the civil power. The issue of the struggle was fatal to him. A council held at Moscow in 1667 condemned him as a rebel to the legitimate authority of the tsars, to whom a large power was recognized in ecclesiastical matters. Peter the Great, in order to carry on his vast plan of reform in every branch of Russian life, abolished the patriarchate, entrusting the government of the Russian Church to a patriarchal vicar, Stefan Iavorsky, and charged Theofan Prokopovich, a Malorossian, a theologian of great renown and a warm admirer of German Protestantism, to draw up a schedule of reforms to be effected in the Russian Church. Theofan, who was later named metropolitan of Pskov, fulfilled the task assigned to him, and wrote the 'Spiritual Regulation,' which became for two centuries the official constitution of the Russian Church.

3. The Synodal Period.—The Spiritual Regulation was written in 1720. On 25 Jan. 1721 the ukase establishing an ecclesiastical board to be endowed with supreme authority over the Church was promulgated. The board under the name of the Holy Governing Synod held its first meeting in Petrograd on the 14th of February. The Holy Synod was composed of several archbishops, priests and a lay dignitary, the high procurator, who, according to the Spiritual Regulation, was to be chosen preferably from among the most energetic officers of the army.

2 The Kremlin, Moscow

With the foundation of the Holy Synod the Russian Church became a department of the civil bureaucracy of the Russian Empire, and its history is thenceforth a portion of the lives and policies of the Procurators. A vigorous censorship was established for all the theological writings. The foundation of new eparchies, the nomination of the bishops, the monastic life, the missions either inside or outside of Russia were topics all necessarily subject to the supervision and approval of the government. The influence of the Russian Church in the social and religious field was unceasingly checked by its bureaucratic yoke. Russian Christianity could not exert the beneficent influence rightfully its own due to it. Control of the Church was gained by the Slavophil party which tried closely to associate autocracy and orthodoxy as the joint pillars of the Russian state. This was notably true in the recent ecclesiastical dictatorship of the Procurator Konstantin Pobiedonostzev. The result of this policy was that the Church lost the intellectual classes, the so called *intelligentsia*, and became a mere tool in the hands of the Russian bureaucracy for the support of tsarism.

4. *The Revolutionary Period.*—This period begins in 1905, as the outcome of a new spirit pervading Russia and exerting its influence over the clergy. A group of liberal priests of Petrograd issued a proclamation of freedom for the Church. This movement was frowned upon by the high clergy, but met with an unconditional support from the lower clergy. In order to answer the demand, the Holy Synod proposed the convocation of a General Synod of the Russian Church. The bishops were invited to outline their plans of reform. A special commission was charged with a preliminary discussion of the radical changes to be introduced into the constitution and inner life of the Russian Church. At the end of 1907, however, the forces of reaction had regained the ascendancy and the project of the general council sank into oblivion.

The downfall of the autocratic régime in Russia left the Russian Church the power of determining her own affairs. With a few exceptions in the ranks of the hierarchy, the clergy accepted joyfully the establishment of democracy. Some even advocated the complete democratization of the Church and the abolition of the hierarchy. But the extremists were unable to awaken in Russia the spirit of a radical reform like that of Luther in Western Christianity. The best elements of the Church met in the General Council of Moscow, held in September–October 1917. Bishops, priests, monks and laymen discussed the conditions of Russian Christianity and came to the conclusion that after the disappearance of Russian autocracy the Russian Church needed a visible religious head, the centre of the religious forces of the crumbling empire. The restoration of Russian patriarchate was approved by an overwhelming majority of votes. Tychon, metropolitan of Moscow, a liberal bishop who lived many years in the United States, was elected patriarch. He assumed at once an energetic attitude against the spreading wave of bolshevism and became the embodiment of the conservative forces in Russia and of sound Russian nationalism. The Russian Church is re-

covering her prestige and fitting herself for the social and political changes brought about by the democratization of Russia.

Statistics.—Before the European War Russian Christianity, or according to the official expression, the Russian Orthodox Church, numbered 87,000,000 of the faithful and there were over 70,000 churches and chapels. From an administrative point of view, autocratic Russia was divided into metropolitan districts, eparchies (dioceses), vicariats, deaneries and parishes. The Russian clergy, charged with the spiritual care of the orthodox population, formed two entirely distinct castes: the "white clergy" (secular priests) and the "black clergy" (monasticism). All the higher clergy (metropolitans, bishops and vicar-bishops) in accordance with an old tradition, have been chosen from monastic ranks.

The Russian hierarchy enhanced their authority and organization under the synodal régime. At the time of Peter the Great, the Russian Church numbered only 18 eparchies and two vicariats. At the dawn of the 19th century there were 36; in 1890, 62. In 1905 the Russian hierarchy consisted of three metropolitans (Petrograd, Moscow and Kiev), 16 archbishops and 108 bishops (including 44 vicar bishops or coadjutors). Most of them have completed their studies in the Russian theological academies. A half, approximately, had been married priests, who, after the death of their wives, embraced monastic life. Under the old régime the metropolitans received a salary of 50,000 to 75,000 roubles. The salaries of the bishops varied between 1,500 and 20,000 roubles.

In spite of the repeated confiscation of their properties, the Russian monasteries grew in wealth and numbers during the synodal period. In old Russia, monasticism lived an exuberant life. Kiev possessed 17 monasteries and Nizhni-Novgorod 20. Peter the Great issued several ukases with a view to limit the number of monasteries and hinder entrance into them of postulants. At the beginning of the 18th century, Russian monasteries held 14,534 monks and 10,673 nuns. As a consequence of the restrictive laws of Peter the Great and Anna Ivanovna, their number was respectively reduced to 7,829 and 6,543. In 1764 many monasteries were suppressed and their properties were confiscated. From 954 at that time, they decreased to 452 in 1810. The protection of Tsars Paul I, Alexander I and Nicholas I restored their prosperity. The monks gathered immense riches. New monasteries were built everywhere in Russia. At the beginning of the 20th century there were over 500 monasteries of monks and 300 monasteries of women, the former with 15,000 monks and novices, and the latter with 38,000 nuns and novices. Among the Russian monasteries four of the most famous are decorated with the epithet of *lavra*: those of Saint Alexander Newski in Petrograd; of Saint Theodosios Pechersky in Kiev; of the Most Blessed Trinity at Serghievo, near Moscow; and of the Assumption at Pochaev. Seven other monasteries are called *stavropigiaki*. In the canon law of the Eastern churches, these attributes mean that the monasteries are subject to the immediate jurisdiction of the patriarch.

The white clergy is charged with the ad-

ministration of the parish churches. They number 2,340 archpriests, 44,487 priests, 14,960 deacons, 43,552 psalm readers. According to the most recent statistics, there are 37,465 parishes and 59,703 churches; the cathedral-churches existing to about the number of 700.

Social Conditions of Russian Christianity.

—A recognized fact in the history of Russian Christianity is the slight influence exerted by the Russian clergy upon their flock. At the outset of her Christian life Russia depended for the foundation of her churches upon the generosity of the princes, or of the *mir* (commune). The choice of the priests for the services of the churches belonged to the members of the parish. The candidates who offered their services for smaller salaries were given the preference. Thus ignorant or loose priests came into possession of ecclesiastical benefices, and consequently the Russian priesthood lost its moral prestige. The nobility contributed to its decay as their serfs were ordained in order to increase their revenues. Russian councils, especially that of the "Hundred Chapters" (Moscow 1551) strove to improve the moral condition of the clergy and to render more difficult entrance to holy orders. In the 16th century there were villages of 30 families, served by four priests.

The ecclesiastical reforms of Peter the Great aimed first of all at reducing the number of the clergy and putting an end to the autonomy of the parishes. In 1722 he fixed one priest as the maximum for a village of 150 families. The sons of the clergy and even psalm-readers and deacons were enrolled in the army. His policy was continued by his successors and in 1841, when the statutes of Russian consistories were promulgated, the last traces of parish autonomy disappeared.

Under the synodal régime the Russian clergy transformed themselves gradually into civil employees. They became clerks, preparing numerous documents and statistics to be used by the civil and military bureaucracy. Not infrequently were their services turned to account by the police authorities. Under a *ukase* of 1716, the clergy had each year to submit a list of all the members of their respective parishes who had not received holy communion. This ignoble subjection to the civil bureaucracy lost the clergy their prestige and could not but result in their enslavement to the autocratic régime. It was not unnatural, therefore, that they should share with the bureaucracy the bitter hatred of the revolutionary leaders. Famous painters like Perov, Riepin, Makovsky, Korzuklin and great novelists like Solovev, Chirigov, Glukhovtsov, Vasilich, and especially Leonidas Andreev, depicted in the darkest colors the degradation of the clergy. A reaction followed in 1905. The better minds in the white clergy became the leaders of a movement for the independence of the Church and her separation from the State. A schedule of liberal reforms was drawn up by 32 priests of Petrograd and inserted into the *Ecclesiastical Messenger*. For several years the struggle between the partisans of the old régime and those of the democratization of the Church went on violently. At last, with the downfall of the Tsarism, the liberal element gained the ascendancy and the Russian clergy, freed from

their servile submission to the State, will doubtless exert a great influence upon the spiritual rebirth of Russia.

Economic Conditions.—Extreme poverty has been the lot of the clergy from the beginning of Russian Christianity. Priests, Golubinsky tells us, were considered as working-men, intended to perform liturgical ceremonies. They did not claim the rôle of leaders and teachers of their people. The laws either forbade or restricted the bequeathal of property to the parish churches; frequently the clergy has had its land confiscated. Before the war the revenues of the clergy were derived especially from the land allotments of the dioceses and the parish churches. The white clergy in the villages had the social rank of the peasants among whom they labored. They themselves were farmers and aimed to keep for their sons the fields which they cultivated. Other sources of income may be noted: the sale of candles and religious articles; tithes; state allowances (not in all parishes, however); and offerings made upon the administration of the sacraments. These offerings are usually pitifully small: 35 cents for marriage, 15 cents for baptism, 3 cents for funeral prayers. Quite frequently, a priest's net income from professional or conventional fees and offerings amounts to no more than \$50 a year. They have been unable, consequently, properly to support their families. Their poverty is one of the common themes of the Russian novelists. It contributed to their estrangement from the upper strata of society, but it associated their lives with the sufferings and aspirations of the poor. The white clergy sympathized with the revolutionary movement, hopeful of an improvement of their economic lot. As yet their hopes have not been realized; but when normal conditions have been restored in Russia it may be expected that the Church will quickly recover its material prosperity.

11. GOVERNMENT AND POLITICAL PARTIES.

Many and varied are the definitions given of Russia's form of government. The difficulty of properly defining or characterizing it is due, in large measure, to its changing and changeable nature—not only since the Great Revolution, but even before that event. If one were to treat the subject historically and adequately, at least five separate stages should be noted in the evolution of the Russian administrative machine. There was, first, the pre-Mongolian free tribal government, which was decidedly democratic; then came the long period of Eastern despotism introduced by Russia's Mongolian conquerors, which destroyed every element of self-government already attained; next followed another long period, ushered in by Peter the Great, during which Oriental absolutism was considerably tempered by Occidental democracy; then, again, the revolutionary demonstrations of 1905-06 brought a short period of quasi-constitutional government in which much real progress toward democratic institutions was made; and, finally, the two revolutions of 1917, the short-lived one of March and its more vigorous successor of October inaugurated many startling experiments in class government, with seemingly disastrous results upon the Russian body politic.

Limitations of space preclude any such extended treatment of this interesting subject. For present purposes, therefore, we shall adopt a simpler, if less scientific, scheme. Generally speaking, Russia was an absolute monarchy up to 1905, a limited monarchy from 1905 to 1917, a provisional democracy for some eight months thereafter and a proletarian dictatorship since the Bolshevik *coup d'état*. Considering the last two forms of government as but different phases of the transitional period, we may continue this brief study of Russia's government under three heads: (1) As it was under absolutism prior to the so-called revolution of 1905-06; (2) as it became during the quasi-constitutional period of 1905-17; and (3) as it has been in the present period of transition.

Under Absolutism (to 1905).—The government machine of imperial Russia was cumbersome, complex and very inefficient—cumber-

some because too centralized, complex because insufficiently specialized, and inefficient because irresponsible. Not only did the regular administrative functions (legislative, executive, judiciary) overlap, as we shall see presently, but no consistent demarcation existed between national, state, and local government. For these and other reasons Russia's political institutions lagged centuries behind the times and were long the laughing stock of the civilized world. In imperial days, however, absolutism, with all its concomitants, was considered necessary for holding in line the numerous and diverse racial, social, and religious elements that composed the colossal Russian Empire.

The supreme authority in autocratic Russia was the *tsar* (from the Latin "Cæsar"), an absolute hereditary monarch, part of whose title was "Tsar of All the Russias." In him were vested all legislative, executive, and judicial powers, which, until the constitutional era above referred to, were exercised without let or hindrance from any legal source. There were, however, three departments of state, composed of functionaries appointed by the tsar, and one special department—the Holy Synod—which helped the monarch to administer his vast empire.

The oldest of these was the *Senate*, created by Peter the Great in 1711 and reorganized by Alexander I in 1802. Its members were all appointed by the tsar and held the rank of Privy Councillors. Being the highest judicial institution of the empire, the Senate (a) heard appeals in civil and criminal cases, (b) passed on the legality of new legislation and (c) held disciplinary court for officials from the various branches of government. For purposes of expedition, this large body of state was divided into six separate departments, two of them acting as courts of appeal, two exercising administrative jurisdiction, and the rest supervising the collection of taxes, the appointment of government officers, the preservation of the archives, etc.

Another important body concerned with imperial administration was the *Imperial Council*, which exercised only advisory legislative authority in pre-constitutional times and consisted of 196 members, half the number (including the president and the vice-president) appointed by the tsar and half elected for nine years. As its function was greatly modified by law in 1905, we shall refer to this legislative branch later.

The *Council of Ministers*, composed of the 12 ministers of state, appointed and removable by the tsar, was a third great organ of imperial administration. Representing all the various ministries—the ministries of Foreign Affairs, Finance, War, Navy, Justice, Education, Commerce and Industry, Ways of Communication, Internal Affairs, Agriculture, Imperial Court and Government Control—the Council of Ministers, or the Cabinet Council, was by far the most important executive institution in monarchical Russia.

For administrative purposes Russia was divided into governments (*guberni*), provinces (*oblasti*) and territories (*okrugi*). If there were such a thing as state rights in imperial Russia, the governments might be said to correspond to the American States. The resemblance is closer, however, in the case of the territorial divisions. Before the World War,

if not at the time the last tsar was deposed, Russia had 98 governments, 21 provinces and two territories. The governments, varying in size and population, were themselves divided into districts (*úyezdi*), which, in turn, were subdivided into still smaller administrative units called counties (*utcháski*). All these divisions and subdivisions run into the thousands, and were not sufficiently graded or standardized. The governments were the more central and more populated sections of the empire, most of them lying within European Russia; while the provinces, all but one of which lay in the remoter parts of the country (Siberia, Caucasus and central Asia), were inhabited by the less civilized and more nomadic elements. Every government or province had a governor (*gubernátor*) as chief administrative officer, who, in the case of the provinces, was generally also the chief military commander. The duties and powers of the Russian governor under the monarchical régime included regulations for safeguarding public order, control over all the administrative offices, supervision of all government officials and general oversight over all local government institutions, such as the *Zemstvos*, etc. In the exercise of these various functions the governor would have the assistance of a board of administration, over which he presided.

Such semblance of self-government as monarchical Russia enjoyed was represented by the *Zemstvo* (q.v.), a territorial assembly which received its official status in 1864, but which has had its powers and functions modified several times since. This elective body has had—and to some extent still has—charge of the provincial administration, which began with the village council (*Mir*), the lowest and earliest form of communal self-government in Russia and not unlike the New England town meeting; gathered authority in the canton (*Vólost*), representing a number of villages, sometimes as many as 30; and culminated in the provincial *Zemstvo*, a combined organization of all the district *Zemstvos*. Both assemblies elected a standing executive committee (*Zémskaya Upráva*) consisting of four or five paid officials, which carried on the work of provincial government—from the construction of public roads, the prevention of cattle disease and the maintenance of primary schools, to the administration of charity, the development of trade and agriculture, the improvement of sanitary conditions and the promotion of mutual insurance and other co-operative enterprises. District *Zemstvos* consisted of from 60 to 65 members and met annually—oftener if necessary and the governor permitted. The latter, too, exercised the power of veto over such *Zemstvo* resolutions as incurred his (or his superiors') displeasure.

The Municipal Dumas were town councils presided over by a mayor (*golová*) and constituted of a few elected officials, who exercised general supervision of municipal affairs. Since 1870 these dumas copied the administrative organization and methods of the *Zemstvos*, but their powers were considerably reduced in 1894.

Under the Quasi-constitution (1905-17).—The tsar's manifesto of 1905 and the famous "Fundamental Laws" which followed it suddenly changed Russia's form of government theoretically and practically. The autocratic

authority of the tsar became more limited through the introduction of a new representative assembly (The Imperial Duma) and the extension of the powers of an old one (The Imperial Council). The emperor still retained his former executive powers, but in the field of legislation he was henceforth to reckon with the two assemblies just mentioned, which became Russia's legislative institutions. The new principle of government thus introduced transformed Russia from an unlimited to a limited monarchy and fairly started her on her way toward representative, constitutional government.

The two legislative assemblies created in 1905-06 suggested, but did not quite resemble, the bicameral parliamentary institutions of Western countries. The Imperial Council, changed by law from an *advisory* to a legislative body, was the Upper House; the *Duma* (q.v.), the Lower. Both houses could initiate legislation, vote on the government budget and make certain recommendations and interpellations; but the Duma was debarred from exercising its authority in matters pertaining to the imperial family and the war and naval departments (including their respective courts). Moreover, the Upper House could throw out any bills or legislation passed by the Duma, while all legislation must receive the sanction of the Senate, the juridical institution retained from absolutist days, and be approved by the tsar before becoming law. Finally, while no legislation could be enacted without the Duma and the Imperial Council, yet the tsar retained—and frequently exercised—the right of issuing certain proclamations (*ukázy*) and of authorizing sundry emergency expenditures, especially in case of war, and more especially when the Duma, which he could dissolve at will, was not in session.

Apart from the legislative control left to the tsar by the so-called Constitution, he retained supreme authority in nearly all executive and judicial matters. He still had the sole power to appoint and dismiss all his ministers, to direct foreign affairs, proclaim martial law, command the military and naval forces, and to do many other things too numerous to mention. In addition to his old powers, the "Fundamental Laws" gave the tsar the right to convene, adjourn, and prorogue both houses of the newly established "Parliament," to dismiss the members elect of the Upper House, to veto any legislation passed by both houses, and to confirm or set aside verdicts of the criminal courts.

With all that, the government of imperial Russia under the charter loosely called "a constitution" was surely, if slowly, assuming democratic form. The creation of the Duma gave Russia her first experience with responsible, representative government, an experience which meant much for her political education and emancipation.

In the Period of Transition (1917-).—The Great Revolution of 1917, the revolution which dethroned the last tsar and ended monarchical rule in Russia, left the administrative government temporarily in the hands of a revolutionary committee appointed by the last Duma and presided over by its president, Rodzianko. Soon this committee, which was the sole

RUSSIA

The Great Bell, Moscow

constitutional authority at the time, organized a coalition cabinet. The new government, which modestly called itself "provisional," was fairly representative of the leading parties composing the last Duma and the elements that hastened the Revolution. It was headed by Prince Lvov, a liberal Octobrist, elected to the premiership conjointly by the Duma and the labor elements (subsequently succeeded by the famous Kerensky), and included such other popular leaders as Paul Milyukov, Constitutional Democrat; Tereshtchenko, a many-sided liberal of truest color; and the above-mentioned Kerensky, a revolutionary Socialist representing the workmen and soldiers, who soon dominated the whole Provisional Government. Under stress of factional criticism, the coalition ministry was repeatedly reformed, becoming every time more and more representative. Five new departments were created to cope with the exigencies of war and peace—departments of Labor, Public Relief, Food Supplies, Posts and Telegraphs, and a department for the Affairs of the Constituent Assembly.

The new government at once declared itself in favor of immediate and numerous radical reforms along every line (including such matters as social, religious and racial equality, and universal suffrage). But the execution of its ambitious program, difficult enough in itself, was rendered well-nigh impossible by the ever-increasing interference with the affairs of government on the part of an emergency organization called into being during the Revolution and known as "the Council of Workmen's and Soldiers' Deputies." Such were the power and popularity of this council that its wishes—and they commonly took the form of mandates—could not well be ignored. From the very first, the provisional government had to reckon with this new influential factor in Russian politics, and such constant reckoning inevitably clogged the wheels of government machinery. Hence the Kerensky government spent most of its short career in finding its bearings and in trying to reconcile the various discordant factions, which lacked both the temper and the tradition of democratic citizenship.

But, little as the first revolutionary government actually accomplished, it gave Russia her first taste of real Democracy, which she is never likely to forget. The spirit, the machinery of administration and the reforms proposed were thoroughly democratic. Seemingly, time and administrative experience were all that was needed for the completion of the colossal task of Russian democratization, but these were denied by the Bolshevik *coup d'état* that soon followed.

Ostensibly, the Bolshevik government was placed in the hands of the Council of Workmen's, Soldiers' and Peasants' Deputies, the popular organization already alluded to but somewhat enlarged to appease the peasant element. This mixed organization, called in Russian simply the *Soviet*, has numerous branches and acts through innumerable agents styled "People's Kommissars" (a term borrowed from the French revolutionists), backed by the force of well-armed soldiers called Red Guards. All these executive officers are supposedly carrying out the will of The Central Executive Committee of the Federal *Soviets*, which is a longer name for the Bolshevik government.

The central figures and guiding spirits of the "Soviet Republic," as the Bolshevik rulers themselves style their form of government, have been and still are Nikolai Lenine, Premier, and Leon Trotzky, Minister of War and formerly Minister of Foreign Affairs. The rest of the cabinet has been changed frequently, but probably still includes Tchitcherin as "People's Commissioner" for Foreign Affairs, Lunacharsky as "People's Commissioner" for Public Instruction, and a few others fairly well known for their revolutionary sympathies.

The rule of a single class, the proletariat, is the ideal of this ultra-revolutionary government, which has been aptly characterized as a "Proletarian Dictatorship." If the first transitional government may be said to have been a "Democracy in the Making," then, surely, the second is a democracy in the unmaking.

Political Parties.—Russia had no political parties in the Western sense before the constitutional era, which is quite natural in view of the notorious want of free political discussion in that country in strictly monarchical times. Such organizations as existed in absolutist Russia were secret debating societies advocating and frequently indulging in terrorism, with revolution as their battle-cry. With the convocation of the first Duma, however—or, rather, with the promulgation of "The Fundamental Laws of 1905" granting the right of free political discussion—regular political parties became for the first time possible in Russia, and the vital factor of political struggle commenced to stir that country's otherwise sluggish life.

Historically the first political party to come into prominence in Russia was that of the "Octobrists," a conservative organization which received its name from the unbounded enthusiasm with which it hailed the famous Manifesto of 30 Oct. 1905. It was this party organized by Milyutin and Shipov, that dominated the Third Duma (1907-12).

A more liberal and more important political party was that of The Constitutional Democrats, formed, also under the influence of the manifesto above mentioned, by radical and independent elements and led by Paul Milyukov, a statesman of international fame. Its membership has included many of the most prominent leaders of Russian thought, and it was the first to frame a definite political program. This party, nicknamed from its initials (K. D.) the "Kadets" has long dominated Russian politics, being both well organized and well directed. It had its own newspaper, *Ryatch*, which was so well edited (by Milyukov) that it soon became one of the leading Russian dailies.

The most radical and aggressive political parties in Russia—and the only ones except the party of Constitutional Democrats to have survived the first Revolution—are, naturally, the various Socialist organizations. There was The Group of Toil, a Socialist labor party represented in the Duma by Alexander Kerensky himself; the Party of Democratic Reform, which was mildly socialistic; the Party of Peaceful Revolution, which believed in Parliamentary reform; the Peasants' Union which stood for the nationalization of land; and numerous other more or less radical parties.

The principal parties advocating revolu-

tionary socialism do not properly concern us here, since they are not *political* parties in the accepted sense of the term. Owing to the current prominence, however, of some of these, mention might be made of the Social Revolutionists, a Marxist organization led by Chernov; the Social Democratic party, which in 1903 branched out into the *Bolshevik* (Maximalist) and the *Menshevik* (Minimalist) wings. The bitter struggle between these two factions cannot be entered into here (see *RUSSIA — HISTORY*), except to say that the former, the extremist wing represented by the present ruling régime in the greater part of Russia, aspires to eliminate entirely every class but the proletariat, while the latter, the more moderate wing, seeks only to place the laborer on a political and economic level with all other classes of society. There are of course other essential differences in both principles and policies, but this single instance will serve as an illustration.

DAVID A. MODEL,
Specialist in Russian Subjects.

12. RUSSIAN INDUSTRY. *Introductory.*—The total national wealth of the Russian Empire, including Poland and Finland, in 1914, was estimated at about \$60,000,000,000, and the total population may be estimated at about 160,000,000, the average wealth thus being about \$375 per capita whereas in the United States the per capita wealth is about \$2,200. The national income was estimated at \$7,500,000,000 of which agriculture furnished about \$4,900,000,000. These figures are a striking illustration of the low stage of Russia's economic development. Though occupying nearly one-sixth of the total land area of the earth, Russia, owing to her geographical situation, as well as to unfavorable historical conditions, has been very backward, economically and industrially.

The transportation system of a country may be taken as the best index of its industrial development. The total length of all the inland waters of Russia reaches about 200,000 miles, yet the length of all Russian canals and improved rivers totals only 1,100 miles, of which the canals represent about 550 miles. The total length of Russian railroads is 46,600 miles, i.e., 0.28 mile per 1,000 inhabitants. In the United States the respective figures are 261,000, and 2.66 miles. Tsarism had a very unfavorable influence upon the development of civilization in Russia, generally, and particularly upon its economic development. Innumerable legal restrictions prevented the development of initiative and enterprise. In Russia in 1913 the total number of joint-stock companies was less than 2,000 and their total capital stock amounted to less than \$2,000,000,000. The total number of wage-earners employed in factories and mines was about 3,500,000. The total amount of horse power used in manufacturing industries of Russia in 1914 was 2,500,000, as against 22,500,000 in the United States. The total foreign capital invested in Russia before the war amounted to about \$4,300,000,000. The largest investors were the French. French capital was invested in government and municipal bonds, and in coal and metallurgical enterprises in South Russia (the Donetz Basin). Next to the French came Belgian capital, invested in street railways, electric plants, coal mines and metal-

lurgical mills. British capital was invested mostly in oil and gold mining, and played a less important rôle in the development of Russian industry than French and Belgian capital.

It must be noted, in this connection, that the government itself was the largest industrial establishment. It owned metallurgical mills, the greatest part of the railroad mileage, the greatest land area and was the largest purchaser of the products of the Russian mining and metallurgical industry. The imperialistic policy of the government determined the direction of Russian railway construction, and of the whole Russian industry.

Russia's share in the world's trade amounted in 1911-13 to 3.6 per cent. Her exports for 1909-13 averaged 1,501,400,000 roubles annually. Her imports for the same years averaged 1,136,900,000 roubles. During the last decade preceding the World War the total of Russian foreign trade was gradually increasing, but the imports were increasing faster than the exports. This was due to the fact that during the years preceding the war Russia was going through a period of intensive industrial development which caused a substantial increase in the imports of machinery.

I. Agriculture and Forestry. 1. Agriculture.—The part played by agriculture in Russia's economics appears from the following figures: in 1910 the total value of the agricultural products of Russia was about 9,500,000,000 roubles in gold (1 rouble in gold = 51½ cents); the total value of manufactured products, 4,900,000,000 roubles. Thus, in 1910, agriculture furnished two-thirds of Russia's total national income. According to the census of 1897, 70 per cent of the population of the Russian Empire were supported wholly or partly by agriculture.

Only about one-twentieth of Russia's territory is under cultivation. This proportion varies considerably throughout the vast area of the empire, viz.: Russia in Europe, 17.5 per cent; the Caucasus, 20.3 per cent; western Siberia, 1 per cent; eastern Siberia, 0.1 per cent; the Steppe region (of central Asia), 1.3 per cent; Turkestan, 1.9 per cent. The total area of the principal crops in 1910-12 is shown in the following table:

CROPS	Desiatines (1 desiatine = 2.705 acres)
Wheat, rye, and barley	67,518,000
Oats, buckwheat, peas, potatoes and lentils	28,342,000
Corn	18,742,000
Flax and hemp	20,312,000
Cotton	4,409,000

The average yield is very low, owing to lack of fertilizers. Artificial fertilizers are almost unknown in Russia. The annual yield of wheat averaged in Russia in 1907-13 10.0 bushels per acre, whereas in the United States it averaged 14.4 bushels, in Canada 19.2 bushels. Modern improved agricultural machinery is scarcely used, yet despite these handicaps Russia contributed a large share to the world's production of grains. During the years 1907-12 Russia produced 48.1 per cent of the world's supply of rye; 31.6 per cent of the total supply of barley; 24.3 per cent of the supply of oats; and 19.0 per cent of the supply of wheat. The export of grains played the most important

part in Russia's foreign trade. The average annual exports for 1910-13 amounted to 11,791,800 short tons, valued at 639,900,000 roubles (\$329,300,000).

2. *Forestry.*—The Russian forests cover about 3,150,000,000 acres, or nearly thrice as great an area as the combined forests of the United States and Canada. Most of these forests are in Siberia. In European Russia there are about 383,000,000 acres, of which 40.7 per cent are in the province of Archangel, 27.1 per cent in the province of Vologda, 8.5 per cent in the province of Perm and 6.2 per cent in the province of Olonetz, in all 82.5 per cent in northern Russia. Of the Siberian forests 30.9 per cent are situated in the province of Tobolsk, 17 per cent in the Maritime province, 16.9 per cent in the province of Tomsk, 16 per cent in the Amur region and 8.8 per cent in the Trans-Baikal region. The forests cover an area of about 54,000,000 acres in central Asia and about 13,500,000 acres in the Caucasus. Russian forests furnish excellent timber and represent one of Russia's greatest resources. Nevertheless the lumber industry in Russia is still in its infancy. A very large part of Russia's forests, especially in Siberia, has not been surveyed at all. Under the old régime no serious attention was paid to conservation of the forests. In some places, as in the Ural Mountains, forests were being destroyed. The income from them was extremely low. Before the World War the net income of the government from the state-owned forests did not exceed 12 cents per acre, and in Asiatic Russia it was as low as one mill per acre. The total value of exports of lumber and timber from Russia for the calendar year 1913 was \$84,850,000. It may be safely anticipated, however, that the lumber industry has a splendid future and will play a very important part in the national economy of the country.

II. *Cattle, and Meat Industry.*—Russia possesses vast prairies, suitable for extensive cattle breeding. Nevertheless the number of cattle per capita of population in Russia is one-fourteenth that of Argentina and less than one-half of the per capita of the United States. Taking eight sheep or three hogs as equivalent to one head of cattle we find in Russia 390 heads of cattle to every 1,000 of population, whereas the respective figure for Argentina is 5,320, and that for the United States 860. It must further be borne in mind that the livestock of Russia's peasantry is of an inferior quality compared to that of Argentina and the United States.

The number of heads of animals by geographical divisions in 1912 is shown in the following table:

GEOGRAPHICAL DIVISION	(000 omitted)			
	Horses	Cattle	Sheep and goats	Hogs
European Russia and Poland.....	22,337	32,842	37,531	11,132
Caucasus.....	1,892	5,627	10,781	1,174
Siberia.....	4,506	5,306	5,141	1,092
Central Asia.....	4,435	5,122	20,613	111
Total for the empire.	33,170	48,796	74,066	13,509

The meat industry in Russia is still predominantly a small scale industry. Centralization is practically unknown. Prior to the Revolution there were no packing concerns like those in the United States. Refrigerating installa-

tions and cold storage plants first made their appearance shortly before the World War.

III. *Mineral Resources and Mining.*—The mineral resources of Russia have scarcely been explored, yet from the available sources of information it can be stated as a fact that Russia is very rich in all kinds of minerals. As far as iron ore is concerned, Russia doubtless holds the first place in the world, although not all iron ore deposits have been explored or surveyed. The iron ore deposits of the Ural Mountains occupy the first place, not only in Russia, but in the whole world. The mountain Blagodatskaya alone contains over 100,000,000 tons of iron ore; the mountain Magnitnaya over 100,000,000 tons. The surveyed deposits of the Ural Mountains contain more than 500,000,000 tons of iron ore. The Ural iron ore is of a very high quality, containing no less than 65 per cent of pure iron and a very small quantity of sulphur. In the Donetsk Basin, in southern Russia, there are two deposits of iron ore of high quality; in Krivoy Rog and the Kerch Peninsula the total surveyed deposits exceed 1,000,000,000 tons. There are also several deposits of iron ore in central Russia, but these are of a lower grade and the ore itself is of a lower quality. The iron ore deposits of Siberia have not been explored at all, but several deposits are known in the Minusinsk district, in the Trans-Baikal province in the Amur district, in the Ussuri province, in the Bay of Saint Olga, near Vladivostok, etc.

The coal deposits are not as plentiful. The greatest coal deposits in European Russia are situated in the Donetsk Basin. Large deposits of bituminous coal exist in the western and central parts of the basin and anthracite in the eastern part. The bituminous coal is of very high quality, and good coke for metallurgical purposes is produced, but the geological conditions are not as favorable as in England or in the United States. The anthracite of the eastern part of the Donetsk Basin (Grushevskaya Moolda) ranks as the best in the world. The second place in the Russian Empire was held by the Dombrowo Basin, in Poland, which has now been detached from Russia. The coal deposits of central Russia are of a low grade (brown coal and lignite). The Ural Mountains contain no deposits of good coal suitable for coking. The deposits of coal in the northern and central parts of the Ural Mountains contain only brown coal and lignite. In the southern part of the Ural Mountains (the Orenburg region), deposits of anthracite are found. In the Caucasus there are some deposits of coal containing a large supply of high grade coal. In Siberia there are very rich coal beds. The best coal deposit is that of Kuznetsk (in the Tomsk province), whose geological conditions are much more favorable than those of the Donetsk Basin. Coal beds are found all along the Siberian Railroad at short distances from one another, also in the Maritime and Yakutsk provinces, and in the Fergan province in central Asia. Good beds are worked in the Augersky (Tomsk province) and Cheremkhovsky (Irkutsk province) mines. There are very rich deposits of excellent coal on the island of Sakhalien, in the northern part, belonging to Russia. Although the coal deposits of Siberia have not been explored and surveyed, yet from all indications it may be

safely assumed that the reserves of coal there are very large.

The oil fields of Russia are likewise unexplored. The best-known fields are found in the Caucasus. The fields of Balakhani, Sou-rakhani, Sviatoy and Grozny furnish about 85 per cent of Russia's total oil production. Oil is also found on the Taman Peninsula, in the region of the Pechora River (Oukhta in northern Russia), in the Transcaucasian region, between the Caspian Sea and the Ural Mountains, in the province of Fergan (central Asia) and on Sakhalien Island.

Copper ore deposits are situated mainly in Asia, viz., in the Ural Mountains, in Siberia, Minusinsk, Akmolinsk, Semipalatinsk, in Turkestan, in Fergana and in the Caucasus, but also in the provinces of northern Russia. The richest manganese ore deposits are situated in the Caucasus (Chiaturi) and next in southern Russia. There are known, also, manganese ore deposits in the Ural Mountains. The richest gold ore and placer deposits are located in Siberia, the Lena deposits in the province of Yakutsk, along the river Vitim, in the Nerchinsk and Barguzin districts, in the Amur region, in the Maritime region and in the Altai Mountains. Next follow the Ural Mountains. Gold is also known to exist in Kamchatka, Sakhalien and in the Caucasus. Platinum deposits, the richest in the world, are located in the Ural Mountains. Silver and lead ore deposits are located in Siberia—in the Altai Mountains, in the Ural Mountains and in the Caucasus.

There are large deposits of phosphates, pyrites, asbestos, graphite, marble, very extensive peat fields, deposits of mica, mercury and nickel. There are also deposits of precious and semi-precious stones, of rare metals, such as tungsten, osmium, vanadium, molybdenum, iridium, etc.

The development of the Russian mining industry is at a very low stage, especially if contrasted with the country's rich mineral resources. The leading part in Russian mining is played by the Donetz Basin in South Russia, which appears from the following comparative figures of production of the principal minerals in the Russian Empire and the Donetz Basin:

AVERAGE ANNUAL PRODUCTION 1912 AND 1913.

MINERAL	Total for the empire. Metric tons	In the Donetz Basin	
		Metric tons	Per cent of total
Coal.....	34,000,000	23,000,000	68
Coke.....	4,200,000	4,200,000	100
Iron ore.....	8,900,000	6,300,000	71
Pig iron.....	4,400,000	3,000,000	68
Cast iron and steel.....	3,900,000	2,200,000	56
Salt.....	610,000	190,000	31
Manganese ore.....	1,000,000	270,000	27

The Donetz Basin is also important as a producer of heavy oils, coal tar and other chemical by-products of the coke industry.

The second place in the mining industry belongs to the Caucasus. In 1913 it supplied 85 per cent of the total of oil, 70 per cent of the total of manganese ore, 56 per cent of the total of silver and lead ore, 96 per cent of the total output of lead, 30 per cent of that of copper and 24 per cent of the total of silver.

Coal.—The growth of the coal mining in-

dustry in Russia is shown by the following figures:

YEARS	Long tons	YEARS	Long tons
1870.....	700,000	1910.....	24,600,000
1880.....	3,200,000	1911.....	28,100,000
1890.....	5,900,000	1912.....	30,700,000
1900.....	15,900,000		

The principal sources of the output of coal previous to the war were the Donetz Basin, which produced 68.6 per cent of the total for the empire in 1912, and the Dombrowo Basin, in Poland, which produced 20.7 per cent of the total. All other regions produced only 10.7 per cent of the domestic supply. The geographical distribution of the production of coal in the empire, exclusive of Poland, in the year 1912, is shown in the following table:

GEOGRAPHICAL DIVISION	Per cent of total for the empire
Donetz Basin.....	86.4
Eastern Siberia.....	5.3
Ural.....	3.8
Western Siberia.....	2.9
Central Russia.....	0.9
Turkestan.....	0.4
Caucasus.....	0.3
Total.....	100.0

In addition to her domestic production of coal, Russia, previous to the war, depended for over one-fifth of her supply upon imports, mostly from Great Britain, and partly from Germany.

Iron.—The development of the iron industry of the Russian Empire and its geographical distribution appear from the following figures:

GEOGRAPHICAL DIVISION	Iron ore		Pig iron	
	Long tons	Per cent	Long tons	Per cent
South Russia.....	5,700,000	70.3	2,800,000	67.7
Ural Mountains.....	1,800,000	22.5	800,000	19.8
Central Russia.....	300,000	3.6	100,000	3.2
Poland.....	300,000	3.6	400,000	9.3
Total.....	8,100,000	100.0	4,100,000	100.0

The relatively small production of pig iron in the Ural Mountain region is due to the fact that it has no coking coal and uses charcoal for producing pig iron. Therefore the Ural region produces the finest kind of sheet iron, its only competitor being Sweden, which also uses charcoal for smelting iron ore.

Oil.—The production of crude oil (naphtha) in 1913 amounted to 9,000,000 long tons, of which 97 per cent was produced in the Caucasus and the rest mostly in central Asia.

Gold.—The production of gold in the Russian Empire in 1910-12 averaged 1,350,000 ounces Troy, of which 80 per cent was produced in Siberia and 20 per cent in the Ural Mountains.

Platinum.—Russia is the chief source of the world's supply of platinum. The world's production in 1912-14 averaged 280,000 ounces Troy, of which the Ural Mountains contributed 263,700 ounces, i.e., 94.1 per cent, British Columbia, 4,800 ounces, i.e., 5.3 per cent and other countries 0.6 per cent.

Copper.—The production of copper has rapidly grown since the beginning of the present century, as appears from the following table:

YEAR	Pounds
1900.....	17,700,000
1910.....	50,000,000
1911.....	57,500,000
1912.....	73,900,000
1913.....	75,600,000

About one-half of the output of copper comes from the Ural Mountains. In 1913 the geographical distribution of the production of copper was as follows: Ural Mountains, 50 per cent; the Caucasus, 29 per cent; Siberia, 16 per cent; all other sections, 5 per cent. The domestic production of copper in Russia was insufficient to supply its demand. About 20 per cent of Russia's consumption of copper in 1908-12 was supplied by imports from foreign countries.

Manganese.—The production of manganese ore in 1913 reached 1,130,000 long tons, of which 77 per cent was produced in the Caucasus and 21 per cent in southern Russia. Previous to the war the Russian Empire held the foremost place in the world's market of manganese ore. The annual exports from Russia in 1911-13 averaged 924,000 long tons, as against 706,000 long tons from British India and 168,000 tons from Brazil. Notwithstanding her rich deposits of high grade manganese ore, Russia produced no high grade ferro-manganese and imported it from abroad.

Salt, etc.—Among other mineral products of Russia must be mentioned salt, of which 1,900,000 long tons were produced in 1912; also silver and lead, zinc, pyrites and asbestos.

Wage-Earners in the Industries.—The number of wage-earners employed in the principal mining industries in 1908 is given in the following table:

INDUSTRY	Number of wage-earners
Coal.....	148,555
Gold and platinum.....	81,235
Oil wells and refineries.....	33,400
Iron ore.....	29,705
Copper mines and smelters.....	21,369
Salt.....	11,514
Silver, lead and zinc mines and smelters.....	3,428
Manganese ore.....	2,855
Total.....	332,061

IV. Manufactures.—An index of the development of manufactures in Russia is furnished by the statistics of establishments subject to factory inspection, which comprise all manufacturing establishments with mechanical power, employing not less than 16 wage-earners. The principal results of the census of such factories, taken in 1908, are presented in the following table:

INDUSTRY	Number of establishments	Number of wage-earners	Value of products	Horse power
			Roubles	
Textile.....	2,959	823,300	1,384,600,000	549,700
Metallurgical.....	2,330	551,900	761,900,000	590,200
Food products.....	7,948	386,400	1,576,500,000	387,100
All others.....	6,773	492,400	929,300,000	549,400
Total.....	20,010	2,254,500	4,652,700,000	2,076,200

The first place among Russian manufactures was held by the textile industries, of which the cotton factories were the most important. The number of spindles in the cotton factories of the Russian Empire and Finland in 1913 was 9,213,000, which represented 6.4 per cent of the total for the world.

Next in importance after the textile industries were the metallurgical mills, including metal working and machine factories. In general this industry was far behind its rivals in the more advanced industrial countries, both in equipment and efficiency. Still there were a few large plants with modern machinery. The largest factories were owned by the government and produced chiefly munitions of war. These establishments were mostly centred in and around the seat of the Imperial government, which accounts for the industrial growth of Saint Petersburg.

Of the privately owned enterprises, those located near the sources of coal and iron were largely controlled by French capital, which also controlled metallurgical works and coal mines in that section.

The domestic production of machinery in Russia was considerably short of the demand for it and the imports of machinery from abroad were the most important items of Russia's import trade.

The chemical industry was among the rapidly growing industries of Russia. According to the census of manufactures of 1908 there were 466 factories with 64,645 wage-earners, and an annual production of 177,279,400 roubles. The value of products had increased since 1900 by 91 per cent.

Among the most favored industries was the beet sugar industry, which enjoyed an export premium from the government. In truth the exports of sugar from Russia were made possible only by the poverty of the mass of the peasantry which regarded sugar as a luxury. The total number of sugar factories in 1911 was 299, with 142,630 wage-earners and with a total production of 1,853,000 long tons of sugar. The area of sugar beet plantations connected with sugar mills and refineries was 1,350,000 acres.

V. Effects of the War and of the Revolution.—The preceding statistical figures have at present only a historical value. The abnormal conditions brought about in Russia by the World War, the Revolution and the civil war have resulted in a complete breakdown of Russian industries. Industry in Russia had become totally disabled even prior to the overthrow of the Tsar. The official publication of the National Manufacturers' Association of Russia, *Promishlennost i Torgovlya* (Industry and Commerce), discussing this problem in its issue of 28 Nov. 1917, notes the fact that the "depression which had manifested itself during the prerevolutionary period was growing during the first five months of the revolution, and became very marked toward the fall." ("The Industrial Breakdown," by P. Samoylov, p. 280). The author holds that this abnormal condition "was due primarily to lack of fuel and raw material and other economic causes." According to official data collected by the Ministry of Commerce and Industry of the first Russian provisional government, during the five months following the overthrow of the Tsar, 568 industrial establishments were forced to shut down, and 104,300 employees were thereby thrown out of employment. These figures do not include those establishments which managed to go on with a reduced force. The principal cause of the shutdown of the

largest establishments which had given employment to one-half of all the workers thrown out of work was lack of fuel. Lack of materials was next in importance. Lack of cotton was responsible for the closing of eight establishments which had given employment to 28,800 workers. On the other hand, lack of orders and financial losses were reported only from 12 per cent of all establishments employing less than 10 per cent of the total number of workers.

The industrial situation in the month of October 1917 is characterized by the shipments of coal from the Donetz Basin which, as has been seen, is the chief coal-producing centre of Russia. During the month of October the shipments of coal amounted only to 1,440,000 short tons, of which nearly two-thirds were consumed by the railroads. This left only 504,000 short tons for the supply of all industrial establishments, which was about one-third of their regular demand for fuel.

The cessation of the war was followed by the closing of munition factories and other war industries. The secession of Ukraina and the Caucasus deprived Russia for a time of her principal sources of fuel. The blockade was directly responsible for the lack of cotton which forced the closing of cotton factories.

The breakdown of the transportation system was, perhaps, the most potent cause of the crisis of Russian industry. It is a well-known fact that the war totally destroyed the efficiency of the Russian railways. On 1 Oct. 1917, the number of disabled locomotives reached 5,551, while work in the repair shops was practically discontinued for lack of metal and fuel. On 31 Dec. 1917, 22,000 loaded cars accumulated at the Moscow railway depot for lack of locomotives to haul them. The Soviet government attempted to relieve the industrial breakdown by a broad scheme of nationalization of industry.

GEORGE J. KWASHA, M. E.

13. BANKING AND FINANCE. Russia's extremely agricultural character makes her banks and banking far less important than her enormous size and population would warrant us to expect. Neither in number nor in magnitude can Russian banks compare favorably with those of west European countries, let alone the United States. Indeed, banks are a comparatively recent institution in Russia. There were no commercial banks at all in that country before 1865, when the first of them (with a capital of 4,000,000 rubles) was established. Nor was their subsequent growth very rapid. The close of the last century still found only 39 such institutions in the whole empire, though their total capitalization approximated 350,000,000 rubles. By 1910 their number had decreased through consolidation to 31, though the number of branch-banks had more than doubled during the decade in question (increasing from 242 to 492) and the capitalization reached the half-billion-ruble mark. Within the next five years, years of unusual industrial and commercial development in Russia, the number and importance of Russia's business banks grew amazingly. In 1915 there were 53 main and 743 branch banks, with a total capital exceeding 1,200,000,000 rubles. The World War, naturally, interrupted this rapid general development of Rus-

sian banking though in its first years it seemed to stimulate even a more rapid growth in certain directions. According to the last statement of the Russian State Bank, published on 6 Nov. 1917—and no more recent reliable data are available at this writing—Russia then had in circulation no less than 19,000,000,000 rubles, with one and a third billions of gold reserve. The total paper currency had grown from 3,260,000,000 rubles in 1915 to about 25,000,000,000 rubles (est.) in 1918, with a greatly depleted gold reserve. Despite the prevailing panic caused by revolutionary conditions, the People's Bank of Moscow was so swamped with deposits that it was opening new branches all over the country to handle their amazing amounts—amounts which during four months of 1917 increased from 353,000,000 to 781,000,000 rubles. But just at the close of that year the Bolshevik government seized all the banks, which shared the sad fate of most other institutions under that régime.

In imperial times the Bank of Russia acted in the double capacity of State bank and commercial bank. The State Bank, the government bank of issue and directly under the control of the Minister of Finance, was the central unifying banking institution that gave the Russian banking system its soundness and stability. Before the World War it was the largest bank in the world so far as actual deposits were concerned. Protected and controlled by the State Bank were numerous State savings banks, established to promote thrift among the people. The government guaranteed all their deposits and fixed their rates of interest. None of their capital could be used for state expenditures, and only profits in excess of 10 per cent went to the government. Losses were met by a reserve fund built up from profits under the 10 per cent maximum permitted by the State Bank. The growth of these popular savings banks, which were represented by at least 10,000 branches all over the country, has been phenomenal. According to the official report made by the Russian Minister of Finance in 1916, the deposits in these savings banks increased by over 3,500,000,000 rubles in the first two years of the Great War. The growth of deposits in the State Bank amounted to 854,000,000 rubles during the first 18 months of that war. Besides these general banks, Russia before the Revolution had special banks, such as mortgage banks, land banks, etc. The functions of these different kinds of loan banks are indicated by their names. It should be noted, however, that the land banks were specially designated as the Nobles' Land Bank and the Peasants' Land Bank, each doing an enormous business before the Great War—over 3,200,000,000 and 5,000,000,000 rubles, respectively, in 1913. There were 36 municipal credit societies in Russia on 1 Jan. 1915, having a total capital exceeding 150,000,000 rubles; while the 53 joint-stock banks for commercial credit had a total capital of about 837,000,000 rubles on 1 July 1915, with deposits approximating 2,900,000,000 rubles the previous year. The principal banks of the latter kind before the World War were the Petrograd International Bank of Commerce (capital 90,000,000 rubles), the Russian Bank for Foreign Trade (capital 80,000,000 rubles), the Azov-Don Bank of Commerce (capital 75,000,000 rubles), the Russian-

Asiatic Bank (capital 65,000,000 rubles), the United Bank of Commerce (capital 46,000,000 rubles), the Russian Commercial and Industrial Bank (capital 45,000,000 rubles), the Volga-Kama Bank of Commerce (capital 31,000,000 rubles), and the Siberian Trade Bank (capital 31,000,000 rubles). All these banks had numerous branches—some as many as a hundred—in various parts of Russia, with headquarters invariably at Petrograd.

The government revenues and expenditures of Imperial Russia were classed under the two general heads of *ordinary* and *extraordinary*, with numerous and confusing sub-classifications. The principal sources and gross amounts of Russia's "ordinary" revenues, as enumerated and officially estimated in rubles for 1915, were as follows: (1) State domains—government railroads, banks, mills, factories, timber sales, etc.—1,700,000,000; (2) Indirect taxes—customs receipts and revenue from sales of tobacco, alcohol, sugar, matches, petroleum, etc.—699,000,000; (3) Duties—revenue stamp receipts, passport charges, taxes on freight and passenger railroad transportation, etc.—514,000,000; (4) Direct taxes—taxes on land, real estate, capital, trade licenses, etc.—375,000,000; (5) State monopolies—mining industries, coinage, liquor traffic, post office, telephone, telegraph, etc.—326,000,000; (6) Reimbursement of treasury expenditures, 124,000,000; (7) Land redemption—payments on land purchased by ex-serfs and other peasants—1,900,000; (8) Sale of state domains—forests, lands and other natural resources—1,850,000; and (9) Miscellaneous revenues—military tribute, municipal contributions, payments on railroad and Crown debts, etc.—15,200,000. If we add to these "ordinary" revenues the 155,000,000 rubles estimated as "extraordinary" revenues for the same year, the bulk of which was to come from state loans, we find Russia's estimated revenues for the first year of the World War mounting up to nearly 3,912,000,000 rubles. Counting the population of the empire as 180,000,000 in 1915 (a conservative estimate), these vast revenues came to about 21½ rubles per capita.

At least 20 items made up the "ordinary" and "extraordinary" expenditures of the Russian government in its imperial days. The former included all the fixed or regular expenses connected with the various ministries; the latter, naturally, most of the irregular or variable disbursements of the government. The cost of running Russia's 11 ministries, which constituted the bulk of her ordinary expenditures, was estimated for 1915 as follows (in rubles and round numbers): Ministry of Ways of Communication, 752,000,000; Ministry of War, 590,000,000; Ministry of Finance, 357,000,000; Ministry of the Interior, 203,000,000; Ministry of Marine, 199,000,000; Ministry of Education, 159,000,000; Ministry of Agriculture, 143,000,000; Ministry of Justice, 101,000,000; Ministry of Commerce and Industry, 57,430,000; Ministry of the Imperial Court, 16,300,000; and Ministry of Foreign Affairs, 7,700,000. The other "ordinary" expenditures for that year included 440,000,000 rubles in payment of state debts, 52,500,000 rubles to the Holy Synod, 8,830,000 rubles for the higher government institutions (Imperial Council, the Duma, etc.), and 27,000,000 rubles in miscellaneous expenses.

The "extraordinary" expenditures were fewer in number and smaller in total amount. There were just four general government outlays under this head during 1915. These were 78,400,000 rubles spent by the Ministry of War; 66,000,000 rubles expended on railway extensions; 9,400,000 rubles devoted to the construction and improvement of ports; and 1,072,000 rubles paid out in railroad subsidies. This makes a grand total of 3,268,632,000 rubles for all estimated expenditures, "ordinary" and "extraordinary," for the year in question—which, on the bases used above, amounted to about 18½ rubles per capita.

Of course these figures do not include Russia's enormous war expenditures, which the Russian Minister of Finance placed at 10,000,000,000 rubles for 1915 alone. That the cost of the World War to Russia, as to the other belligerent nations, increased as the struggle continued, goes without saying. Specific estimates by years vary greatly, but Russian authorities place the whole cost of the World War to Russia at 56,599,275,699 rubles.

The rapid growth of Russia's national debt during the war is another means of gauging its cost. This increased from 8,811,380,000 rubles on 1 Jan. 1914, to 32,300,000,000 rubles on 1 Sept. 1917, when Russia no longer figured in the war. To cover this and subsequent deficits, Russia made several internal war loans, some of which were taken up abroad, and at least two foreign loans, amounting to \$100,000,000, placed in the United States, which alone is believed to have extended financial aid to Russia approximating \$325,000,000. Just what the financial situation in that country is at present (fall of 1919), with the Bolshevik government still in power, cannot even be conjectured. With all her pre-Bolshevik government loans repudiated by this reckless régime in 1918, and with her unprecedented issues of unsecured paper money, Russia's financial credit at home and abroad has already reached the lowest ebb in her whole precarious history.

DAVID A. MODELL,

Authority on Russian Subjects.

14. RAILWAYS, HIGHWAYS AND WATERWAYS. Russia's enormous size makes her means of transportation and communication even more essential than these vital factors generally are in smaller countries. Yet, neither her railroads nor her waterways have been developed or utilized to anything like their maximum efficiency, both lagging behind Russia's industrial and commercial progress.

This is especially true of the Russian railroad system, which, while it is the second largest in the world in point of trackage, falls far behind those of England, Germany and the United States in actual efficiency. The growth and development of Russia's railroads has been very rapid, however. Beginning in the sixties of the last century, when but 264 miles of tracks were constructed annually, and passing through a period of tremendous development between 1895-99, when the annual increase of lines averaged 1,915 miles, the development of Russian railroads reached its highest point just when the Great War broke out—and, naturally, interrupted it. Conflicting figures are given for the total mileage of Russian railroads immediately before the World War.

In 1917, according to the American Railway Commission in Russia, the total mileage of all railroads in European and Asiatic Russia (exclusive of Finland) approximated 43,300. Only about 25 per cent of these railroads were then double-tracked. Before the Russian Revolution (q.v.) about two-thirds of Russia's vast railroads belonged to the government, the rest being owned by private companies. Despite their poor equipment and inefficient operation, Russian railroads carry enormous numbers of passengers and mountains of freight. No very recent statistics are available here, but in 1914 a total of about 250,000,000 passengers and 235,000,000 tons of freight were transported by Russian railways. What the figures were during the war, with its unprecedented movements of men and supplies, can only be conjectured at present.

The principal Russian railroad lines connect the outlying provinces of central, southern and western Russia one with another and with the chief Baltic, White Sea and Black Sea ports. Moscow, the centre of Russia's greatest industrial region, is naturally the most important Russian railroad centre. Next comes Petrograd, the actual commercial centre of Russia, which is linked with the older Russian capital by the Nicholas Railroad. Nijni-Novgorod, the leading commercial city on the Volga, ranks third as a railroad centre. Connected with Moscow by the Nizhni-Novgorod Railroad, it is a great distributing point for much of the grain that comes from such agricultural trading centres as Kazan, Riazan, Samara and Saratov. Another railroad, the Moscow-Kursk, connects Moscow with the densely populated governments of central and southern Russia; and still another, the Moscow-Briansk, connects it with the city of Kiev, the fourth largest city of Russia. The Riga-Orlov Railroad runs directly to the port of Riga, on the Baltic, and connects that important city with those of four or five adjacent governments, finally making a junction near Dvinsk with the Warsaw Railroad. The Yelets and the Griaze-Tsaritsin lines help to connect the fertile black-soil region of southern Russia with the western part of the country. The Petrograd-Warsaw and the Moscow-Brest lines connect Petrograd and Moscow with Poland and the Austro-Prussian frontier. Then there is, of course, the great Trans-Siberian Railroad (q.v.), the longest continuous railway in the world, which connects such remote cities as Petrograd and Vladivostok, 5,435 miles apart by rail, which is one and three-fourths times the distance from New York to San Francisco by the shortest route. This enormous railroad, costing over \$172,525,000 in initial outlay and taking nearly 12 years to build—it is being extended by branch lines and made more efficient by double-tracking all the time—is double-tracked from Omsk to Vladivostok, a distance of 3,566 miles, which exceeds the distance across the whole American continent. The Trans-Siberian Railroad has given a great impetus to commerce and agriculture in both European and Asiatic Russia and has greatly promoted Siberian immigration. In the Great War, when it was naturally taxed to the utmost, its services were inestimable. The much-needed lesson taught Russia by the exigencies of that unprecedented war is being improved by the above-mentioned

railway commission, which has already increased the efficiency of Russian railroads to a very considerable extent.

Russia's internal waterways, covering so large a part of two continents, are naturally the longest in the world. The country is intersected by numerous rivers, lakes and canals which afford direct water communication between the Caspian Sea and the Arctic Ocean, between the former and the Baltic and between the Baltic and the Black Sea. Exclusive of Finland, European and Asiatic Russia has about 250,000 miles of waterways. But, owing to the lowlands through which they pass, Russian rivers are generally not very deep. Hence only about half their mileage—not more than 132,000 miles, at any rate—represents really navigable waters, the rest being navigable by rafts and small sailing vessels. Moreover, most of Russia's internal waterways are practically ice-bound in winter and some are greatly affected by drought in summer, especially in their southern reaches. Yet, despite these handicaps, about one-third of Russia's immense freight is transported by water, which still affords by far the cheapest means of communication. And the proportion of waterway to railway transportation in Russia is bound to increase rather than diminish as time goes on, judging from the vast and numerous waterway improvements projected by the Executive Committee on Water Transportation during the Great War.

There are six large river systems in the former Russian Empire—two in Europe and four in Asia—and these, with their numerous connecting canals, make up a network of waterways unsurpassed anywhere else in the world. Of the two European systems, that of the Volga River is by far the larger. It lies in the East and includes the waters of the Neva Basin as well as those of the northern Dvina, which empties into the White Sea. The other European Russian river system is that of the Dnieper, which flows south into the Black Sea. This is the Western system and includes, besides the Dnieper Basin itself, the basins of the Western Dvina, the Nieman and the Vistula, which link together the Black Sea with the Baltic. The two systems, together, afford a continuous water route between points so distant as the city of Astrakhan, on the Caspian Sea, and Petrograd, on the Gulf of Finland, 2,540 miles apart.

The principal river systems in Asiatic Russia are those of the Ob River, the Yenesei, the Lena and the Amur. The first is the largest and most important, comprising all the rivers of the West Siberian plain north of the Russian Atai and northern Mongolia, with at least 7,000 miles of navigable waters. The Yenesei system, second in size, drains about 870,000 square miles of Siberian territory and has a total of 4,500 miles of navigable waters. The Lena River system comprises over 5,000 miles of navigable waters and drains the northern Irkutsk region as well as the greater part of northeastern Siberia, an area exceeding 1,000,000 square miles. Finally, the Amur system, which drains the Russian Far East, affords another 5,000 miles of navigable water routes. Together, all these vast waterways, connecting here and there with the Trans-Siberian Railroad, have been one of the greatest promoters of Siberian colonization and expansion. The

maintenance and control of Siberia's river systems, as well as of the large and deep Lake Baikal (a fresh water lake of unlimited possibilities), is vested in the Russian Department of Ways of Communication, which recommends and makes necessary improvements. The future of Siberia undoubtedly depends quite as much upon her vast waterways as upon any other single factor, the great Trans-Siberian Railroad not excepted.

A country so predominantly agricultural as Russia must of necessity depend a great deal on wagon roads and highways for means of transportation and communication. While Russia's ordinary wagon roads are apt to be impassable in spring and fall, they afford very cheap transportation facilities the rest of the year, especially in winter, when sledging is almost universal. It is then that Russia's agricultural and other products can be transported most conveniently from the villages to the towns and railroad stations by millions of peasants whose time is all their own. There are about 75,000 miles of ordinary (unpaved) roads and over 15,000 miles of post (macadamized) highways in European Russia alone. The latter connect all the principal cities, thus linking together such important centres as Moscow, Petrograd, Warsaw, Kiev and Kharkov. The post highways, over which millions of passengers travel in winter and summer, were built by the tsars, but are kept in repairs by local authorities and the rural communities through which they pass.

There are at least six kinds of roads and highways in Asiatic Russia: (1) Main highways, (2) caravan roads, (3) local roads, (4) colonization roads, (5) by-roads and (6) commercial highways. Space does not permit a description of the character and function of each, except to add that the principal road in the first class (the famous Sibirskiy-Trakt) alone exceeds 4,000 miles in length, that the local roads (some 61 in number) have a total mileage of 16,000, and that there were about 6,600 miles of colonization roads in 1913. Most of these Siberian roads are of a rather primitive character, though examples of more modern highways are not unknown even in this undeveloped part of Russia.

15. ARMY AND NAVY. At least three vital factors have combined in the past to make a large standing army essential to Russia's political integrity and imperial well-being: (1) Her vast territorial extent, which made three practically separate armies necessary; (2) her diverse and very numerous ethnic elements, which made racial revolts an ever-present danger; and (3) her peculiar geographical position, which necessitated a very considerable army to guard her extensive frontiers. Fortunately, Russia's enormous population, a population which has always enabled her to put more men under arms than any other nation in Europe or America, makes it comparatively easy to supply any number of soldiers needed in peace or war. Thus, while her standing army before the Great War probably did not exceed 1,700,000 trained men, Russia could always mobilize twice that number. In the World War she had no less than 12,000,000

men under arms, with perhaps as many millions more under training.

Like most other European countries, imperial Russia had universal and compulsory military service, which she first established by law in 1874. Theoretically, every able-bodied male between the ages of 21 and 44 was liable to conscription; but exceptions and exemptions were quite numerous. Finally, many of the non-Slavic races found in the Russian Empire—such as the aborigines of Siberia, the inhabitants of Turkestan, the Caucasians, and the subjects of the grand duchy of Finland—being deemed undependable, were permanently exempted from military service. Such exemption, however, involved considerable exemption taxes in the case of the Finns and Turkestanians, at least. These and other ways, honest and dishonest, of evading military service in Russia made conscription there much less onerous than it is elsewhere in Europe.

The number of conscripts to be called annually was usually determined by the Imperial Senate in accordance with recommendations made by the Minister of War. Thus the quota of new recruits would vary from year to year. Immediately before the Great War about half a million men were drafted out of the 1,300,000 liable for military service; and on this basis had not the war intervened the number of recruits would have increased by about 150,000 annually for the ensuing year or two. The general demoralization following the Russian Revolution naturally wrought havoc with the Russian army, greatly depleting its ranks through wholesale desertions and undermining its morale through premature relaxation of discipline. With the conditions existing under the Bolshevik régime, several rival armies have long been operating in various parts of Russia. The largest and strongest of these would seem to be that of the Bolshevik government, called "the Red Guards," and composed largely of mercenary troops and German officers.

The Russian army in pre-revolutionary times had the usual four branches—infantry, cavalry, artillery and engineers—to which the Great War has added an indispensable fifth, the aviation branch. The infantry consisted of regulars, Cossacks, militia and what corresponded to the German Landsturm. Only the first of these divisions maintained its full strength in time of peace, while the Cossacks' ranks were normally kept at one-third their war strength. The conditions and length of service varied slightly before the World War, but were generally as follows: For the infantry and the artillery, three years in the active army and 15 years with the first reserves; for the cavalry and other branches, four years in the active army and 14 years with the first reserves; and for all of them five years with the second reserves. This makes a total liability to military service of 23 years for these particular branches, while the Cossacks' liability is practically lifelong. The latter, after two years' training at home, entered the active district regiment of the first order at 21. After four years of active service there came four years' leave of absence, which meant service in regiments of the second order, with a month's military training every year. Then followed another four years of active service in regiments of the third order and five

years with the reserves, after which the Cossack, splendidly trained and well disciplined, belonged to the Landsturm division.

The term of military service would be reduced by five years for university graduates, who served but two years in the line and 16 with the reserves, and graduates of secondary schools, who served three years in the line and 15 with the reserves.

For military purposes imperial Russia was divided into 14 districts, each in charge of a district commander. In 1914 the Russian army had 37 army corps, each of which generally consisted of two infantry divisions, an engineer battalion and sometimes a division of cavalry. On a war footing an army corps had between 36,000 and 40,000 men. Two of the three separate armies maintained by Russia before the Great War were stationed in Europe. There were some 40,000 or 50,000 frontier guards permanently on the Austrian, German, Rumanian and other frontiers. Behind these guards, in the various military districts, were the regular army corps. The principal military headquarters in European Russia in time of peace were located at Saint Petersburg, Moscow, Kiev, Kovno, Grodno, Vilna, Minsk, Odessa, Riga, Revel, Warsaw, Lodz, Kharkov, Smolensk, Vitebsk, Simferopol, Dorpat and Brest-Litovsk. The Caucasian army, consisting of at least four cavalry divisions, had its headquarters at Tiflis and Alexandropol. There were, besides, considerable forces (some 150,000 troops) stationed in central Asia, while those normally in the Far East were by no means negligible. Military schools and academies were quite numerous in Russia before the Revolution and, naturally, were located near military headquarters.

Russia's navy has not attained such high rank among the navies of the world as her unlimited resources would seem to have made possible. But the Russians, it should be remembered, are not naturally a seafaring people, and shipbuilding is with them a comparatively recent art. It was Peter the Great (q.v.) who first organized the Russian navy as one of his pet ideas, but it never amounted to much until comparatively recent times. Its growth was so slow at first that only in the early part of the last century did it attain third rank among the world's navies. Even this rank was lost after the Crimean War, and such relatively small navies as the Turkish, Italian and German were in the middle of the 19th century easily surpassed Russia's naval strength. But late in that century (in 1884) a new naval program was begun in Russia which by 1895 again raised her navy to third rank. Such naval progress was not long sustained, however. In the Russian-Japanese War Japan's more modern fleet easily and decisively defeated Russia's squadron near Tsushima. Since that disastrous defeat Russian naval reform and expansion have gone on apace, though effective reorganization began only in 1911. The full naval program as then projected involved the construction of 24 new battleships, 12 battle cruisers, 24 lighter cruisers, 108 destroyers and torpedo boats and some 36 submarines. The entire program was to be carried out by 1930, when the Russian navy would indeed have become very formidable. The Great War interrupted this huge naval program which, from present indications, will never be completed.

Before the war with Japan Russia maintained four separate naval squadrons—one each in the Pacific Ocean, the Baltic, the Caspian and the Black seas. Before the World War the entire Russian navy consisted of some 200 vessels of various types, with a total displacement of approximately 408,000 tons. These warships included seven battleships (five of the dreadnought type), seven battle cruisers, five armored cruisers, seven fast and other cruisers, 118 destroyers, 40 submarines and 15 torpedo boats. But these figures give no adequate idea of the nature and size of the Russian navy in the Great War, in the first years of which many important additions must have been made as vessel after vessel then building was completed. The actual increase from this source has never been tabulated. It could hardly have offset Russia's considerable naval losses during the war, which were greatly augmented by revolutionary conditions, especially under the Bolshevik régime. What the Germans did not sink or capture of Russia's navy—and the Black Sea fleet nearly all fell into their hands—Bolshevik maladministration ruined or rendered impotent.

Before the revolution Russia had three principal navy yards at Petrograd—the Baltic works, the New Admiralty Yard and the Galerny Island Yard—one each at Kronstadt, Sevastopol, Vladivostok, Reval, Libau, and Helsingfors.

Special Authority on Russian Subjects.

16. RUSSIA AND THE WORLD WAR.

The immediate cause which brought Russia into the conflict was a declaration of war by Germany on 1 Aug. 1914, following an ultimatum requiring that Russia should demobilize within 12 hours. On being asked by the Russian Foreign Minister (M. Sazonov) whether the inevitable refusal of Russia to this curt summons meant war, the German Ambassador replied that Germany would be forced to mobilize if Russia refused. Up to this stage there were but two belligerents—Austria-Hungary and Serbia, and they had opened hostilities only two and a half days before. In reply to a message from President Wilson to the effect that the United States stood ready at any time to mediate between the warring powers, the German emperor on 10 Aug. 1914 handed Ambassador Gerard a personal letter to the President. This document was first made public on 5 Aug. 1917. In it the emperor stated that a general order of mobilization issued by the tsar on 31 July 1914 had rendered war inevitable. This theory was upheld on the German side for a considerable period of the war, for in his maiden speech to the Reichstag on 19 July 1917 the new German Imperial Chancellor, Dr. Michaelis, stated that Germany was forced into the war "by Russia's secret mobilization, which was a great danger to Germany." On 5 September of the same year he repeated the charge, saying it was "now irrefutably established that it was not Germany who had chosen the time for the war, but a military party surrounding the tsar, which was under the influence of France and England." Against this view may be set the statement by Prince Lichnowsky in his famous memorandum: "On 30 July, when Count Berchtold [Austrian foreign minister] wanted to give way, we [Germany], without Austria

having been attacked, replied to Russia's mobilization by sending an ultimatum to Saint Petersburg, and on 31 July we declared war on the Russians, although the tsar had pledged his word that so long as negotiations continued not a man should march — so that we deliberately destroyed the possibility of a peaceful settlement . . . it is not surprising that the whole civilized world outside Germany attributes to us the sole guilt for the World War." The oft-repeated question of "mobilization responsibility" — as to which state was the first to mobilize — has been much canvassed. At noon on 31 July 1914 there was proclaimed throughout Germany a "state of danger of war" (*Kriegsgefahrzustand*), the preliminary step to mobilization. At 4 P.M., four hours later, the kaiser telegraphed to King George, ". . . I have just heard from the Chancellor that intelligence has just reached him that Nicholas, this evening, has ordered the mobilization of his entire army and fleet." It will be observed that there is a discrepancy of one day between the account of the kaiser and that of his Ambassador. An acute analysis of this subject may be found in 'Current History' (Vol. XIII, p. 496) from the pen of Dr. David Jayne Hill, former United States Ambassador to Germany. (See also *ib.*, Vol. XII, pp. 473-475). Russian foreign relations with certain powers are treated under separate heads. See ALLIANCES; AUSTRIA-HUNGARY AND THE WAR; BALKAN LEAGUE; BALKAN WARS; BERLIN CONGRESS; EASTERN QUESTION; PERSIA; RUSSO-JAPANESE WAR; RUSSO-TURKISH WARS; TRIPLE ALLIANCE; TRIPLE ENTENTE; WAR, EUROPEAN: HISTORICAL INTRODUCTION AND DIPLOMATIC HISTORY.

Throughout the period preceding the Crimean War the relations between Russia and Great Britain had been of a friendly nature; such controversies as arose from time to time were always amicably settled. That friendship dated back to the middle of the 16th century, when Ivan the Terrible concluded a commercial treaty with Queen Elizabeth and even aspired to win her hand. In 1806 Alexander I instructed his ambassador setting out for London that "Russia and England are the only powers in Europe which for many years to come cannot be jealous of one another or have conflicting interests." Two disturbing elements arose, however, that were destined entirely to change the course of European history — Russian expansion in central Asia and the Turkish Empire. In time Russian opinion veered round to the view that Great Britain was the natural and implacable enemy of the Russian nation and its vital interests, while in Great Britain there grew up a conviction that an attitude of jealousy, distrust and hostility was alone possible toward Russia. A dread of a Russian invasion of India seized the British imagination. This began about 1830, but already in Pitt's time England became alarmed at Russia's victories over the Turks and it was seriously proposed to send a fleet to assist the latter. It is immaterial at this date to revive the question of whether the so-called "Testament" of Peter the Great or of Catherine II provided for the acquisition by Russia of the Bosphorus and Constantinople, but it may be asserted that the trend of Russian policy toward Turkey pointed in that direction. "The Turkish government

is the enemy of the human race," wrote Prof. Spenser Wilkinson over 20 years ago; "it is a rule of bestial force, of corruption, of lies and of unrighteousness. The duty of Europe is to make an end of it, and to set up a civilized government in its place. But Europe has never been able to do this because the Powers are divided." Within these few words lies half the history of Europe during the 19th century. Discussing Turkey with the British Ambassador on 9 Feb. 1853, the tsar Nicholas I said, "we have on our hands a sick man, a very sick man. I tell you frankly it would be a very great misfortune if he should give us the slip some of these days, especially if it happened before all the necessary arrangements were made." Five days later he told the Ambassador that he would not allow England to gain a foothold in Constantinople, but would engage not to establish himself there, "that is, as a proprietor, I do not say as a guardian." He also hinted that he might be obliged by circumstances to occupy Constantinople. The Crimean War quickly followed, in which Great Britain, France and Sardinia fought on the side of the Turks against Russia. Nearly 50 years later Lord Salisbury confessed that in this war Great Britain had "backed the wrong horse." At the close of the Russo-Turkish War of 1877-78, England and Russia nearly came to blows again over Constantinople, but once more was the Turkish Empire saved from destruction. From 1863 dates the steady advance of Russia in central Asia; Afghanistan and Persia became zones of friction with England; in the Balkans, Russian aims clashed with those of Austria, while in the Far East, Japan looked askance at the Russian approach through Manchuria to the Sea of Japan. From 1872 to 1895 there were periodical wrangling between Russia and England over the boundaries of Afghanistan; the arrival of a Russian army at Merv in 1884 produced in England what the 8th Duke of Argyll facetiously described as "a violent attack of nervousness." More than perhaps any other great European power, Russia followed a consistent foreign policy; with plodding perseverance she aimed at securing an ice-free outlet to the sea, in the Far East and on the Persian Gulf. Her conquests in central Asia brought peace, order and security to that region; she abolished slave-raiding, constructed railways and introduced modern industrialism. While material progress was fostered, however, education was not attempted.

In 1888 France lent Russia 500,000,000 francs (\$100,000,000), thus paying the way to the Dual Alliance. Democratic France allied herself with autocratic Russia chiefly because she feared a German attack. Year by year the indebtedness of Russia increased, until at length economists began to ask whether Russia was not paying the interest on her old loans with the principal of her new borrowings. Russia began to enjoy the security of the reckless debtor: she could always ask for more, because if more were refused France might lose all that she had embarked. After the accession of Tsar Nicholas II in 1894, the German emperor so successfully played upon the young tsar and the French Foreign Minister, M. Hanotaux, that Germany became a quasi-silent partner in the Dual Alliance. French diplomacy

multiplied difficulties with England in Africa and Asia. The Franco-German-Russian combination directed its energies to isolate England. At the close of the China-Japanese War in 1895 the terms of the Treaty of Shimonoseki were dictated by the European triumvirate to the detriment of Japan, who was compelled to evacuate Port Arthur, taken from the Chinese. This proceeding drove Japan into the arms of England and to prepare for her revenge. The year 1898 stands out in bold relief as a momentous epoch in world history. The Spanish-American War was in progress; an European coalition against the United States loomed on the horizon; France was in the throes of a semi-civil war over the Dreyfus case; with England she stood on the verge of war over Fashoda; the Franco-Russian alliance was neutralized, even paralyzed; Italy and France were at daggers drawn; the United States annexed Hawaii; Russia took Port Arthur and Talienwan; England took Weihaiwei, and France obtained a 99 years' lease of the Bay of Kuang-Chau-Wan. But perhaps the climax of that eventful year was the issue, in August, of the tsar's famous "Peace Rescript" to the world, calling for a general disarmament. France was infuriated; her dream of *revanche* was shattered. In the same year, too, Austria and Russia arrived at a Balkan agreement, while the kaiser landed in Palestine, dressed in the garb of a Crusader, and assigned to himself the protection of the Holy Places, which the Pope had refused him. At Damascus he declared himself to be "at all times" the friend of the 300,000,000 Mohammedans in the world.

For the time being Russia stood as dictator of the world's affairs, backed by France and Germany. The territorial scramble in China seemed to presage the break-up of the Celestial Empire. England stood isolated, helpless to intervene on behalf of the Armenians or to prevent the Greco-Turkish War. With the outbreak of the South African War in October 1899 the tripartite coalition—or at least Germany—made strenuous efforts to bring about active intervention, but both Russia and France drew back. At the time of the Boxer Rebellion in 1900 Russia occupied Manchuria, promising to hand the territory back to China on 8 Oct. 1903. In 1902 came the Anglo-Japanese Alliance. Russia failed to evacuate Manchuria on the stipulated time, and on 9 Feb. 1904 Japan commenced hostilities without a declaration of war. On the battlefields of Mukden, Japan wiped out her score of Shimonoseki with Russia; by the Treaty of Portsmouth, Russia relinquished Manchuria to China and made her leasehold rights on the Liao-tung Peninsula (which included Port Arthur), over to Japan. The Russian disaster changed the political situation and profoundly disturbed the balance of power, for one partner of the Dual Alliance was temporarily eliminated. Relations between Russia and England had been severely strained during the war over the North Sea incident, when the Baltic fleet had fired on British trawlers, believing them to be Japanese torpedo boats.

From 1898 onward a new under-current had been working under the troubled diplomatic waters. In that year M. Hanotaux had been replaced at the Quai d'Orsay by M. Théophile

Delcassé, to whom fell the task of settling the Fashoda incident with Great Britain. It was he who realized the peril of a conflict between those two countries and resolutely set himself to remove it. While Russia was being battered by the Japanese, M. Delcassé concluded (8 April 1904) the Anglo-French Agreement and established the Entente Cordiale. That move stunned Germany, for the incredible had happened. After the Japanese War, Russia seemed to have reached the limit of her borrowing facilities. The French banks with the government behind them refused to assume the sole responsibility for floating another Russian loan. When Lord Lansdowne left the Foreign Office in December 1905 he had already begun the negotiations which were to end in the Anglo-Russian Agreement of 1907. Sir Edward Grey pursued them and by the spring of 1906 the alliance was virtually concluded, though the convention was not signed till 31 Aug. 1907. In March 1906 a great Russian loan was floated in London and Paris—the first one in London since 1854. From this period, Russia drew liberally on British capital up to the European War. Thus were three quondam enemies brought into the same political orbit by an "understanding" against the Triple Alliance, though there was not, as in the case of the latter, any specific stipulations for mutual defense. Between Russia and England, Persia still remained the apple of discord. With Austria, Russia had once been on good terms. In the Revolution of 1848 it was Russian troops that had saved the throne and empire of Francis Joseph. Austria repaid this obligation by mobilizing on the Russian frontier during the Crimean War, thus contributing to Russia's defeat. For over a century the Dual Monarchy had opposed Russian ambitions on the Bosphorus and had directed covetous eyes toward Salonika. Russia, to her credit be it remembered, had been the chief instrument in liberating the Balkan States from Turkish rule. She had also constituted herself the protector of the Slavic Balkan nationalities. But Austria had greater interests in the peninsula. The populations were her next-door neighbors and she had millions of Slavs under her rule. Pan-Slavism constituted a real danger to the state. Russia was further away; only Rumania, neither a Slav nor strictly a Balkan state, touched her borders. Slav and Teuton seem born enemies; the evolution of the former is one of natural growth as opposed to that of forced development; he has never bartered his individuality for any preconceived higher cult, and it was just this Slav element within her gates that contributed most effectively to the collapse of Austria in 1918. Her traditional policy of suppressing rising nationalities necessitated the procedure of keeping the Balkan Slavs weak and divided among themselves and against themselves by promoting strife between them. This policy of mischief-making was prompted by self-preservation and directed against Russia. The latter power was by no means guiltless of intrigue. She worked for the elimination of the Turk from Europe and the strengthening of Serbia. Austria and Germany were interested in holding together the Turkish Empire, upon the assistance of which they reckoned in a war with Russia. Austria had repeatedly

threatened Serbia and Montenegro with war, in the full knowledge that Russia would immediately intervene by force. As the Russian Foreign Minister informed the British Ambassador on 25 July 1914, Austria's bellicose attitude toward Serbia "was in reality directed against Russia. She aims at overthrowing the present *status quo* in the Balkans and establishing her hegemony there."

Russian relations with Germany had been more intimate than with any other country, physically, if not spiritually. Since the days of the early Muscovite tsars Russia had been overrun with German officials, originally invited to introduce Western methods. They supplanted the natives in administrative positions and were hated by the people over whom they ruled. The large number of German names borne by Russians to-day bear witness to this. Frequent intermarriage between the nobility of the two countries brought it about that Russian society, from the court downward to the bureaucracy, was permeated with German ideas and influence. But while the Germans regarded Russia with contempt as an inferior race, they feared her on account of her strength in man-power. Frederick the Great had suggested the partition of Poland between Russia, Prussia and Austria; when that was accomplished, all three were equally interested in preserving their Polish territory, thus forming a tacit union between them. From that period every revolt in western Europe was represented to Russia as a menace to all sovereigns, ever since the first French Revolution. The same policy was energetically pursued by Bismarck. Russia had been largely instrumental in delivering Prussia from Napoleon I, and had again come to the aid of Prussia in 1870 by threatening Austria with immediate war if she came to the aid of France. But for this, the Franco-German War might have been avoided. At the Berlin Congress in 1878 Bismarck stood against Russia, and when he had formed the alliance with Austria against Russia and France, he concluded another pact—the "re-insurance treaty"—with Russia against Austria. Bismarck is credited with having pushed Russia into war with Turkey in 1877, and William II induced her to waste her strength against Japan in 1904.

The agreement with England in 1907 completed the Triple Entente, the bond that held solidly together despite outside efforts to shake it. Russia remained firmly with her allies through a succession of shocks—the Bosnia-Herzegovina crisis of 1908, Agadir, the Balkan wars and, finally, into the Great War. With her inexhaustible man-power and her vast natural resources, Russia was indeed an invaluable ally, but the weak points in her armor were soon to be disclosed. She had entered the war heavily handicapped. Her factories and transport services were deficient, and could neither furnish nor distribute the supplies required by the army and the civil population; it was only by a reckless sacrifice of life that she won her early victories. Soon, owing to the shortage of shells, rifles and munitions, the army was left almost defenseless before the enemy, and many of the troops had to fight with sticks and stones. As disaster succeeded disaster in the field, the undoubted

enthusiasm with which the nation had responded to the call to arms gradually cooled; enemy agents sowing dissension completed the breakdown of Russia.

So-called "Willy-Nicky" telegrams which had passed between the German emperor and the tsar in 1904-07 (published in the *New York Herald* Aug.-Sept. 1917), showed that the kaiser had persuaded the tsar in 1905 to participate in a coalition against England. These negotiations, however, antedate the Anglo-Russian Agreement. The secret treaty between the two monarchs was shortly after torn up by Count Witte. The Allied diplomats who were personally acquainted with the tsar have never doubted his loyalty. Russia's tremendous military efforts during the first two years of the war literally saved the Allied cause.

Editorial Staff of The Americana.

17. RUSSIA, DIPLOMATIC RELATIONS OF THE UNITED STATES WITH. The United States and Russia, with their many striking examples of similarities and contrasts, have had between them some curious and interesting sympathies but no important political relations. Their relations, although not intimate, have usually been friendly—and were especially so from 1861 to 1867.

In the period of the Revolution, the ruling empress, Catherine II, with all her professions of neutrality, showed no acts of sympathy for the revolting English colonists, although several Russian Poles allied themselves with the American cause.

The traditional friendship between them originated in various acts of Alexander I who succeeded to the Russian throne in March 1801. President Jefferson, who since 1786 had been interested in Pacific trade, in 1803 (in connection with the Lewis and Clark expedition) suggested plans for commercial communication between the United States and Asia via the Northwest Coast. In November 1803, although no treaty had been arranged with Russia, he sent a consul to Saint Petersburg. The Russian Foreign Minister in May 1808 requested the negotiation of a treaty regulating trade with Alaska which American vessels had visited for trading purposes since the beginning of American nationality. He complained of American clandestine trade in arms and ammunition with the Indians, and soon thereafter he suggested a southern boundary limit which the United States rejected because it was far south of 55 degrees which the emperor had designated as the southern boundary in 1799. In June 1808, Russia appointed Daschkoff as consul-general at Philadelphia and also chargé-d'affaires at Washington where he presented his credentials on 11 July 1809. At the same time Jefferson secretly sent William Short on a special mission to request Russia to protect American commerce against aggression of the European belligerents, but after reaching Paris he waited for additional instructions and finally returned without going to Russia, his appointment having been rejected by the Senate just at the close of Jefferson's administration.

John Quincy Adams who was commissioned Minister Plenipotentiary to Russia on 27 June 1809 remained in Saint Petersburg until April

1814, when he took his leave. Although there had been difficulty in getting admission to Russian ports and in determining the limits of the Russian settlements, he found a willingness to adjust all causes of friction. The emperor took a lively interest in American affairs — showing an "obstinate attachment" of which there were frequent evidences in the decade that followed. In the War of 1812, doubtless inspired chiefly by desire to strengthen Great Britain in contest against Napoleon rather than by friendship for the United States, he offered mediation to secure termination of hostilities in a war which was for the United States inglorious. Later he was selected to arbitrate one of the difficulties resulting from the war and the Treaty of Ghent, and in 1822 decided that Americans were entitled to an indemnity, the amount of which was fixed at \$1,204,960 by a mixed commission.

By 1817 the importance of establishing a defined southern limit to Russian settlement in America was considered. In 1816 Russian traders from Alaska established a fort at Bodega Bay in what is now California, north of San Francisco, and another at Atooi in the Sandwich Islands. In 1821 the tsar by ukase gave to a Russian company exclusive right to territory as far south as 51 degrees and threatened to make the northern Pacific a *mare clausum* by excluding foreigners from the seas within 100 miles from the coast.

Against this Russian policy the United States co-operated with Great Britain in remonstrance, and President Monroe incorporated a manifesto in his famous declaratory announcement of 2 Dec. 1823. Finally, Russia, refusing the bribe of California which Mexico had offered for a recognition of Mexican independence, yielded to the combined protest of the United States and Great Britain, and on 17 April 1824 concluded her treaty with the United States fixing the parallel of 54° 40' as the southern boundary of Russia and also providing for freedom of trade for 10 years and granting the right to fish along the coasts of Russian America, except in the rivers and harbors; but, after 10 years, believing that the privilege had been abused, she refused to renew the agreement for allowing either fishing or trading.

In the meantime Russia continued to maintain a spirit of apparent goodwill toward the United States, co-operating with her in regard to Spanish American affairs, taking an interest in a proposed arbitration between the United States and England, and assisting the United States in arranging contemplated negotiations with Turkey.

In 1832 the United States negotiated with Russia a treaty providing for reciprocal liberty of commerce and navigation and also reciprocal liberty of sojourn and residence in order to attend to their affairs and with the same security and protection as the natives.

After 1835, although the Van Buren administration in 1839 complained of the Russian pretension to exclusive dominion on the northwest coast and a year later exhibited some anxiety in regard to a lease of the Russian American dominions by the Hudson's Bay Company, the continuation of good feeling was shown by the continued expression by the Russian government of a friendly interest in American relations with Great Britain just be-

fore the negotiation of the Webster-Ashburton Treaty.

Although connection between the United States and Russia was slight they continued to remain on good terms and on several occasions before 1861 acted in harmony in the Far East where both secured advantages from English and French victories which opened China to intercourse with the commercial powers. American relations with Russia at once became more important following the extension of the American boundaries to the Pacific in which consequent increase of American interests invited changes and enlargements of policy. Realizing this, Secretary Clayton in 1850 invited Russia to accede to the Clayton-Bulwer Treaty and Secretary Webster in 1851 declared to Russia the policy which the United States was disposed to pursue in regard to the Sandwich Islands. In 1854, and throughout the Crimean War, certain influential American newspapers openly expressed sympathy for Russia. On 22 July 1854, Secretary Marcy negotiated with Russia a convention on rights of neutrals. At the same time, Russia was extending to the United States facilities in negotiating a commercial treaty with Persia.

The diplomatic correspondence indicates a good American understanding with Russia from the close of the Crimean War to the opening of the Civil War. The Russian government agreed to Marcy's doctrine as to the Declaration of Paris and was ready to take the initiative in the effort to extend the principles over Europe. There was a desire for increase of intercourse between the two countries. Early in 1858 Stoeckl, the Russian chargé-d'affaires at Washington, was raised to the rank of minister plenipotentiary, and in 1858-60 there was conference and friendly co-operation as to joint interests in China and the opening of the Amoor to free trade. It was seen that the friendly relations between the two countries would favor the United States much in the development of the Pacific and Eastern trade, which would increase with the growth of the Frazer River settlement and extension of a railway to the Pacific. In December 1859, Russia was sounded on negotiations for the cession of Alaska for \$5,000,000 which the Russian government regarded as inadequate but as meriting deliberation.

The continuous growth of Russo-American cordiality after the opening of the War of Secession was significant. In 1861 the two governments agreed to co-operate in establishing cable connections between Saint Petersburg and San Francisco by way of Bering Sea and Siberia. Throughout the war which threatened the integrity and strength of the American Union, Russia remained friendly to the government at Washington. In 1862 she refused to join in Louis Napoleon's proposal of mediation or intervention in the American War; and, in 1863, when a revolt in Poland caused apprehension of an Anglo-French diplomatic intervention there as well as in America, she demonstrated her goodwill toward the American government by sending a fleet on a friendly visit to American waters causing various rumors and suggestions of a possible Russo-American alliance. In 1866 the American Congress recognized the friendship of this international amenity by sending Gustavis V. Fox, Assistant Secretary of the

Navy, with a formidable vessel of the navy on a special mission to Saint Petersburg to congratulate Emperor Alexander II on his escape from an attempted assassination. In return for this mission which was received with imposing ceremonies, Russia (a year later) planned to send the Grand Duke Alexis on a visit to America.

A fitting climax to this strange paradoxical friendship appeared in the negotiations resulting in a treaty of 1867 for the transfer of Alaska which, although it had been suggested as early as 1845 and contemplated again in 1854 and in 1859, surprised the diplomats of the Old World.

Although the absence of conflicting interests after the transfer of Alaska seemed a guarantee against serious dispute new sources of controversy arose, first, in connection with Anglo-American negotiations for adjustment of serious questions, and later, from reactionary Russian policy after the death of the liberal Emperor Alexander II in 1881.

Near the close of 1870 when a series of events contributed to hasten the American negotiations with Great Britain for the adjustment of the Alabama claims, Constantin Catacazy, the Russian Minister who since his arrival in 1869 had interfered in questions not appropriately connected with his legation, suggested to Fish that the condition of European affairs indicated that it was an opportune time to press for an immediate settlement which he expected to result in the American annexation of Canada, but Secretary Fish proposed to the British Minister Thornton a basis of settlement which omitted any mention of Canada and resulted in the famous Treaty of 1871 for the peaceful settlement of Anglo-American difficulties—doubtless much to the surprise of Russia. Catacazy continued to use methods at variance with diplomatic practice to defer or to prevent a peaceful adjustment with England. He did not hesitate to use the newspapers to influence the public on questions pending before the government. His continued methods of interference to prevent the successful execution of the provisions of the treaty whose negotiation he had unsuccessfully attempted to prejudice and defeat made him intolerable and finally induced the American government (in July 1871) to suggest his recall and later impatiently to urge it, notwithstanding the "intimate ties of amity" between the two governments. Secretary Fish acceded to a postponement of the recall only because Russia found his removal inconvenient and impracticable until after a prearranged visit of the Grand Duke Alexis.

Although after the close of the period of the "entente cordiale" there appeared evidence of continued friendship—such as resolutions unanimously adopted by the United States Senate in March 1881 denouncing the assassination of Emperor Alexander II and extending condolence, and the promotion of popular sympathy by American shipments of food to relieve the famine sufferers of Russia in 1892—the chief subjects of correspondence in the last quarter of the 19th century were sources of friction and irritation.

An extradition treaty signed on 28 March 1887 met strong opposition in the United States from those who urged various objections against treating Russia with the same considera-

tion as countries such as Great Britain or Switzerland, but after six years of delay its ratification was advised by the Senate (February 1893) and it was proclaimed by the President in June 1893. In 1894 an agreement for a *modus vivendi* in relation to seal fisheries was concluded. In September 1900, by exchange of notes, a claims protocol submitted to arbitration certain differences relating to American claims.

After 1890 earlier friendly relations gradually changed and after 1898 became increasingly unsatisfactory by the aggressiveness of Russian diplomacy and by repressive measures of Russian internal administration. Americans condemned the harshness of the Siberian exile system, published to the world by articles of George Kennan in 1888-89, and the increasingly reactionary spirit of government authorities shown in severe treatment of Poles and Jews—many of whom emigrated to the United States in increasing numbers, destitute and with their tales of woe to spread a hatred of the land from which they had fled. In 1903, following the horrible massacre of Kishinev which was believed to have been instigated by government authorities, the Washington government brought the subject into publicity by an unusual and unsuccessful inquiry whether the Russian government would receive a petition from American Jews. In 1904 President Roosevelt expressed the American nation's condemnation of the outrage at Kishinev.

Russian aggressiveness in diplomacy became a larger source of danger. Germany and Russia, who in 1895 were foremost in intervening to deny to Japan the legitimate fruits of her victory over China against the latter's exclusive policy, in 1897 seized strategic positions in China which, together with demands for vast concessions, threatened the complete exclusion of the United States. In the Spanish-American War, Russia favored Spain and participated in a movement to make a European question of Cuba.

Thus in connection with the revolution in international relations after 1898 a wider divergence of Russo-American interests resulted from events in the Far East. The threatened disintegration of China induced the American government to propose (6 Sept. 1899) a policy of "open door," largely directed against the exclusive trade policies of Russia in Manchuria where the recently constructed trans-Siberian Railway gave her special advantages. Later (1900) the American government presented a courteous reminder of Russia's promise to evacuate Manchuria whose occupation appeared to menace American trade and manufacturing interests. A continuation of the controversy was a sequel of the peace-making in China following the Boxer troubles.

In the Russo-Japanese War, American public opinion favored Japan to a high point of enthusiasm, causing considerable astonishment and anger to many conservative Russians, but at the close of the war bitter feelings were softened by President Roosevelt's successful initiation in facilitating peaceful negotiations resulting in the Treaty of Portsmouth and by later American sympathy for reforms in Russia.

Although Russia showed gratitude for the peace, her subsequent acts in violating the open door principle in Manchuria resulted in a di-

vergence of policy in the Far East, again causing friction, chiefly illustrated in the American propositions to internationalize the railroad system of Manchuria under Chinese management and with foreign capital in order to eliminate the political purposes of Russia and Japan. It was further illustrated in the new facilities offered to Russian encroachment in Manchuria and Mongolia following the Chinese revolution of 1911 resulting in the American note of 3 Feb. 1912. In Persia also in 1911, the American government viewed with some concern the Russian action in forcing Commissioner Shuster to leave the country.

In 1912 Secretary Knox secured the right of the United States to participate in a loan needed by the new Chinese government, resulting in an arrangement (of June 1912) for a loan shared by bankers of six powers. After the rise of new difficulties resulting from hesitation of China and the imposition of new conditions which China in her extremity was compelled to accept, President Wilson, 18 March 1913, reversed this policy in recognizing the new Chinese republic, and withdrew government support from the combination of the six-power loan.

Meantime, on 7 July 1911, the United States and Russia together with Great Britain and Japan concluded at Washington a treaty for joint protection of fur-seals and sea otters in the north Pacific above 30° latitude for a period of 15 years.

The serious dispute in regard to non-admission (even for short visit) of American Jews into Russia, whose government had never officially abandoned the theory of perpetual allegiance, finally led to an American agitation for abrogation of the Russo-American commercial treaty of 1832.

As early as 1873 Secretary Fish protested against Russian treatment of American citizens of Jewish birth as a violation of the treaty of 1832, to which Russia replied that the treaty must be interpreted in accord with requirements of Russian domestic law. The importance of the subject increased by increase of intercourse and in 1880 Secretary Evarts and in 1881 Secretary Blaine vigorously protested to no avail—as did Frelinghuysen in 1884–85 and Bayard in 1886. The subject was investigated by Secretary Olney in 1895 and in 1902 Secretary Hay at the request of Congress made a detailed report showing that Russia was clearly violating provisions of the treaty of 1832. The United States had been inactive from a desire not to offend Russia, but a large Jewish immigration, and consequent political and business influence, finally led to offensive action in the House of Representatives in 1911 through the passage of an intemperate resolution ordering the abrogation of the treaty. The Senate proposed a more diplomatic substitute resolution which was unanimously adopted. Meanwhile President Taft properly informed Russia of the intention to abrogate by a year's notice as provided in the treaty.

Thus after seeking ineffectually for over 30 years by deliberate processes of diplomacy to persuade Russia to observe the treaty, the United States resorted to the remedy provided by the express words of the treaty, and on 1 Jan. 1913 the treaty was abrogated. The ac-

tion met a strong protest from reactionary Pan-Russian leaders. Unsuccessful steps were at once taken to negotiate a new treaty on a basis satisfactory to the United States. The issue was not one easily settled by compromise or by arbitration. As each party showed no disposition to recede from its position no progress was made in negotiations.

After 1914, with the disappearance of many causes of alienation and with the probability of a satisfactory understanding in regard to China and Japan, American opinion was again disposed to be friendly to Russia—and especially to sympathize with the struggle for liberal reforms in government.

A general arbitration treaty signed in October 1914 was proclaimed 25 March 1915. A protocol of agreement concerning exportation of embargoed goods from Russia to the United States was signed at Washington 23 Sept. 1915.

During the earlier phases of the Russian revolution, the American government with a view to encouragement and aid sent a mission headed by Elihu Root, whose achievements were soon canceled by the development of the revolution, near the close of 1917, under control of unscrupulous Bolshevik-German agents acting solely in the interests of Germany.

Many look forward to the re-establishment of genuine good feeling after Russia has again recovered her international influence through a satisfactory solution of her internal crisis whose end was difficult to foresee at the beginning of 1919.

RUSSIAN COSSACKS. The name of Cossack is derived from the Russian *Kazak*, which in turn came from a Tatar word, meaning adventurer, rover, freebooter. The Cossacks of the former Russian Empire enjoyed certain special privileges in return for which they were obligated to render a very extensive military service, nominally from 18 to 50, practically from 18 to 38, of which 12 years in active service. The Cossack, under these agreements, was bound to furnish his own uniform, equipment and horse, the government providing merely his weapons, guns, etc. The officers were trained in special military schools, and this tuition was really better than that for the officers of the regular army in the rest of Russia. The general administration was kept separately for each *voisko*, and differed in each case. The central administration culminated in

the Ministry of War in Petrograd, and there also, with the aid and advice of delegates from each *voisko*, new legislation for the Cossacks was discussed, deliberated upon and passed. In time of war the 11 Cossack *voiskos* supplied 890 mounted *sotnias*, or squadrons, each of 125 men; 108 *sotnias* of infantry, of equal strength; and 236 guns, representing 4,267 officers and 177,000 men, with 170,695 horses. But altogether they furnished 328,705 men for military service. The Cossack population of the whole of Russia numbered, according to the census of 1893, 2,648,049, and in 1905, 3,252,637, of which 1,573,898 were women. Altogether they owned 146,500,000 acres of land, 105,000,000 of which was arable and most of the remainder in forest. This land (leaving out of consideration the small space occupied by towns) was divided into *stanitzas*, or villages, the average rate of holdings per soul being 81 acres, with special grants to the officers, in lieu of pension, from *esaul* upward, leaving altogether about one-third of the whole land for future use. Altogether there were 11 Cossack *voiskos*, or tribes, settlements; namely, those of the Don, the Kuban, Terek, Dnieper, Astrakhan, Ural, Orenburg, Siberian, Semirychensk, Amur and Ussuri. Their location, of course, was always along border lands, past or present, of more or less military or political importance. There are very few towns of any size within the Cossack holdings, and the *stanitza*, or Cossack village community, was and remains the unit. The *stanitzas* hold their land in common, on the principle of the Russian *mir*, but with wider attributes, such as village assembly, assessing taxes for local purposes or for the whole of their *voisko*, dividing the tillable land at regular stated intervals, providing schooling for the children, village grain stores and electing its *ataman*, or communal elder, its judges, etc. All this, of course, applies to conditions before the World War. Since the Bolshevik régime has been set up in the heart of the former empire, the Cossack communities everywhere have resisted the introduction of this economic and political system within their areas, mostly by force, and at this writing successfully.

As a rule popular education is more advanced among the Cossacks than among the remainder of the Russian populations, attendance being both larger in percentage and more regular. In addition to agriculture, which supplies more than their needs, leaving a considerable proportion for export, the Cossack population devote themselves largely to the breeding of horses and cattle, to viticulture in the Caucasus, to fishing on the Don, the Caspian and the Ural, to hunting and agriculture, etc. The fructification of the mining lands within their territories is almost altogether left to non-Cossack strangers, the privileges being chartered out, or subject to an annual rent, to a percentage of the gross output or some other similar method of farming it, while trading and manufacturing are mostly permitted on payment of a license. From of old the typical Cossack despises trade, banking, manufacturing and similar occupations. Ethnologically considered the Cossacks are of mixed origin. They are conglomerate descendants of Russian, Lithuanian and Polish ancestors, fugitives

mostly who had fled from serfdom and joined the free settlements of the Cossacks in the 16th and 17th centuries, and who mingled racially with the aborigines, Tatars and other tribes of Mongolian race, such as the Polovtsi. Physically the Cossacks are more hardy than the Russian proper, though they bear a resemblance to the latter, and share with him certain characteristics, but are physically more slender and supple, of bold, handsome features and dark, expressive eyes, and of vastly more energy and daring. The Cossacks are nearly all adherents of the Greek Orthodox faith, very devout in observing its tenets and ritual, intolerant of other creeds and violently anti-Jewish, hence the frequency of pogroms on territory settled by Cossacks. At different periods the Cossack hetmans, or military chiefs, have exercised greater or lesser power over their tribes or confederations, according to the times and circumstances. Some of them, by their innate genius, achieved supreme and autocratic prerogatives, with scarcely any interference by the kings of Poland or the tsars of Russia, as did Chmielnicki. But as early as Ivan the Terrible's reign the tsar was beginning to be acknowledged, first among the eastern branch of the Cossacks, as their overlord or suzerain, and at last the chief hetman of all the Cossacks became the tsarevitch, or eldest son of the Russian tsar, who assumed his power with certain ancient ceremonies, such as the investment with the *bulawa* and *bunchuk*.

History.—The Ukraine (i.e., "borderland"), extending from Kiev to the Black Sea, was the first home of the Cossacks, who under the nominal suzerainty of Poland, then by far the largest and most powerful country in the East, here grew and developed into a race of their own. A slow process it was. After the long Tatar and Mongolian invasion had at last subsided, before which the nomadic and roaming tribes had fled or been annihilated, the first small Cossack settlements were founded. These were constantly added to by hosts of fugitive serfs from the feudal estates of Poland, Lithuania, Muscovy, who joined the bands of rude and plundering freebooters along the eastern limits of the steppe. This went on steadily for three centuries, about 1400–1700, during which time the Don and Dnieper Cossacks founded warlike fraternities, with fastnesses along the river shores or on inaccessible islands. As early as 1514 the *Kazaki* were formed into companies and placed respectively under the command of the Polish frontier *starostas*, or governors, those of Kaniev, Kamenets, Cherkask, etc., but a shifting policy was pursued by Poland all along. It was altogether within the nominal domains of the Poland of that time that Cossack territories were located, and hence the earliest traces of Cossack history form a part of Polish history, although from the very start the Cossacks claimed a large measure of independence and autonomy, and in most instances succeeded in maintaining it. Nevertheless, undoubtedly Poland made use of the Cossack settlements and of the Cossack fighting spirit to protect her eastern and southern boundaries. But under various Polish rulers there were also erected by Poland strongholds, like Bar and Krzemi-

enec, by which that commonwealth meant to defend herself both against the frequent murderous irruptions of the Tatars of the Crimea and Azov, and against the marauding or rebellious Cossacks. But a settled policy Poland had not. The *dzikie pola*, the "savage steppe," remained "savage" for three centuries. Up to 1500 in fact the large steppe, extending from the Dnieper to the Ural, had no settled population. Hunters and fishermen frequented its innumerable rivers. Shoals of runaway serfs from Poland, Lithuania and Muscovy, settled beneath the shelter of the stockades and armored blockhouses or watch towers built, from time to time, to guard the southern frontiers of Poland and Muscovy. The Tatars and Turks, being the declared foe of all Christians, the Cossacks exterminated them for centuries, wherever feasible, and went on frequent expeditions undertaken as a rule for the sake of booty. The latter in turn they sold to Poles or Muscovites, and this, as a matter of fact, for a long period was their largest item of revenue. The same motive impelled them in making their frequent raids along the shores and to the harbor cities of the Moslem Black Sea. These raids off and on became veritable naval battles, in which the Cossack light and easily managed long boats would prove superior to the clumsy Moslem galleys. One king of Poland, Vladislav IV, was so greatly hampered in his national policy by this guerilla naval warfare that he had to conclude a special agreement with the Cossacks regarding it. Like the Vikings of old, the Cossacks would undertake raids in their flotillas of light sail boats along the whole coast of the Crimea, then and for many years after under the power of the Khan, and to the opposite shores of the Black Sea, to Batoum, to Trebizonde, Samsoun, etc., burning, slaying, devastating all, and causing annually millions of damage, bringing home immense booty. They would now and then even, under the leadership of some specially bold adventurer, penetrate as far as the Sea of Marmora, to the very haunts of the sultan of Turkey, and this irrespective of whether the latter was at peace with Poland or not, thus often wilfully entangling the web of international statecraft.

The Cossacks had been little meddled with by their Polish suzerains, so long as they kept on defending the frontiers against the Tatars and Turks who made frequent inroads. The Don Cossacks, as early as about 1600, had definitely cut loose from their brethren, the Cossacks of the Dnieper, the so-called Zaporozhians, and from the time of Ivan the Terrible had at least nominally placed themselves under the authority of Muscovy, the determining reason with them for this step being that the Russians, like themselves, were of the Greek Orthodox faith. The Don Cossacks, however, were by no means steadfast in their allegiance. They kept wavering, sometimes neutral, at other times taking sides with one party or the other, as their ungoverned spirit inclined them. For the Cossacks of the Dnieper, though, who still remained under Polish suzerainty, there had been, throughout the whole of the 16th and the first half of the 17th century, a slowly accumulating list of grievances against their Polish overlords. The Poles, above all, living under a strictly feudal social and political sys-

tem, had all along laid claim to territorial feudal rights over the whole Ukraine, including even the very Cossack belt of land on the Dnieper, a claim which the Cossacks had never admitted, they calling themselves the "Cossack Republic" or "The Free Brotherhood of the Dnieper." Now, from some time before 1600, and corresponding with the anti-Reformation set up by the Jesuits in Poland proper, another element of strife and dissatisfaction had been infused into the relations subsisting between Poland and her nominal vassals, the Zaporozhians; namely, the religious one. A persistent attempt was made, under Jesuit guidance, to turn the Cossacks and all the people of the Ukraine from adherents of the Greek Orthodox creed into Roman Catholics. Unwise harshness was shown in this long drawn-out proselyting campaign, and the whole Ukraine, but more particularly the actual Cossack portion of it, conceived a deep hatred for their oppressors. To facilitate the conversion of the Greek Orthodox inhabitants of the Ukraine the Poles had hit upon the expedient of founding, with the assent of the Vatican, a new branch of the Roman Church under the caption of the Uniate denomination, leaving intact the dogmas and ritual of the Greek Orthodox Church, with some slight modifications, but bringing it under the governance of the Roman pontiff. The Cossacks, therefore, and with them the Ukrainians as a whole, began to hate their Polish lords not alone as their feudal oppressors, but also as their spiritual ones, as heretics. The whole Ukraine was in a ferment during the 17th century. The Cossacks, with the assistance of the Ukrainian settlers, rose in rebellion, in 1635-36, and this rising was put down by Poland with the utmost difficulty. Retribution of the severest type was meted out by the Polish Diet. But the great rebellion that broke out in 1648, and which shook Poland to its very foundations, was the one at the head of which was Bogdan Chmielnicki, hetman of the Zaporozhians, or Cossacks of the Dnieper, one of the most singular and able men in history. By allying himself with the Tatars of Crimea, their foes of centuries, he in the spring of 1648 marched suddenly with all his available forces against the flower of Polish knighthood, and simultaneously there was a general uprising, terrible and bloody, by the settlements of the Ukraine—most of them also Greek Orthodox and descendants of Cossack forefathers. While Chmielnicki, with the help of the Tatars, defeated and destroyed one Polish army after the other, the serfs and settlers of the Ukraine wiped out nearly the entire race of Polish lords that had ruled them for so long. Every manor house was reduced to ashes; every lord destroyed with bestial cruelty—impaled, sawn asunder, flayed alive; every Catholic priest was hanged before his own altar, usually between a Jew and a slaughtered hog. On 23 Sept. 1648, at Pildawa the main Polish army of 40,000 was utterly destroyed. During the following three years Chmielnicki with his hosts made himself complete master of the whole Ukraine, and conducted himself like an independent sovereign, even receiving ambassadors from several great powers. But at last, on 1 July 1651, Bogdan Chmielnicki was defeated at Berestecko. But the fruits of this victory were

not gathered by Poland, now hurrying to her destruction, but by Muscovy-Russia, while another result of this great feat of arms was that it did away forever with all dreams of Cossack independence. The Cossacks, little by little, transferred their allegiance from Poland to Russia.

There were, however, repeated attempts by a number of Cossack heroes or leaders to establish political autonomy. One of these was made by Stenka (Stephen) Razin, originally a hetman of the Don Cossacks, who was sent off on a diplomatic mission to the Kalmuck Tatars, and then made himself head of a piratical brotherhood. But in 1670 he openly rebelled against the government at Moscow. He captured Cherkask, Tsaritsyn and took Astrakhan, converting the latter into a Cossack republic. He spread rebellious doctrine as far as Nizhni-Novgorod, Penza, Tambov, etc., even Moscow. Razin proclaimed his object to be to root out the boyars and *tchinovniks* (officials), and to establish absolute equality, such as practised by the Cossacks within their commonwealths. A number of pitched battles were fought by Razin's adherents and the czar's armies, but finally, one year later, Razin was captured at Kagalnik, and taken to Moscow, where after unspeakable tortures, he was quartered alive.

Mazeppa, whose full name is Ivan Stepanovitch, another Cossack hetman and man of ability, was born in the Ukraine, near Kiev, about 1640, and died on 22 Sept. 1709, in Bender, a fellow-captive of state with his ally, King Charles XII of Sweden. Byron's poem has made Mazeppa's name and romantic life history familiar to readers. In his youth, being then a page at the royal Polish court, a jealous husband had him strapped to the bare back of a vicious steed, and thus driven into the wilderness steppe. Being rescued by roaming Cossacks, he next became secretary to the Cossack hetman Ivan Samoilovitch, and himself hetman in 1687. He aided materially Peter the Great in his wars against the Turks and Tatars in Crimea and Azov. But later he turned against the tsar, and made the last attempt on a large scale of obtaining political independence for the Cossacks by allying himself with the Swedish monarch, sharing at last his defeat at Poltava, and his flight to Turkish territory where he breathed his last, having attained a ripe old age. Pugatcheff, also hetman of the Don Cossacks for a time, in 1773, during the reign of the Empress Catherine II, raised once more the standard of revolt among the Cossacks. He did so by pretending to be Peter III, the murdered husband of the empress, and his scene of action was the Volga region. For more than a twelve-month he kept the armies of the sovereign at bay, but was finally crushingly defeated, 2,000 of his supporters being killed and 6,000 taken prisoners, including himself. He was beheaded in Moscow. Pugatcheff's name and exploits still live in popular legends and ballads throughout Russia. During the World War now come to a close, the Russian Cossacks, as long as Russia remained in the field, have sustained their great warlike reputation, and at this writing it is one of their leaders, General Denikin, although fighting against tremendous odds, that successfully is opposing the Bolshevik fighting masses, just as it was

another such leader, General Korniloff, who just before the accession of Lenine, would have saved Russia from Bolshevism if properly supported. What the ultimate fate of all the 11 Cossack settlements within the former empire is going to be is matter of conjecture merely. But if they are allowed their way they will enjoy autonomy.

WOLF VON SCHIERBRAND,

Author of 'Russia: Her Strength and Her Weakness,' etc.

RUSSIAN PEOPLE, LEAGUE OR UNION OF, or UNION OF TRUE RUSSIANS (the "Black Band" or "Black Hundred"), a reactionary political group of Russia organized in 1905 to combat the rising revolutionary tendencies of the period, and powerful for about five years. Its members supported the traditional Russian régime, including autocracy, and sought to counteract revolutionary activities by employing terrorist methods against them. It was contended that the government secretly connived at their efforts. Their ranks were recruited from the nobles, and they maintained that Russian political troubles in general should be ascribed to the non-Slavic element of the population. They were particularly charged with organizing pogroms against the Jews. In the first sessions of the Duma the party was not strong, but by a manipulation of the suffrage laws they gained ascendancy in the third Duma, one of their members, Prince Volkonsky, becoming its vice-president. The party was for a time the recipient of favor in high circles, but gradually lost its power through the disaffection of some of its members who disapproved of its extreme measures, as well as by internal quarrels, and a growing public sympathy for the measures and tendencies it was formed to suppress.

RUSSIAN THISTLE, a naturalized annual (*Salsola tragus*, one of the *Chenopodiaceæ*), becoming a dreaded pest in the northern and western United States. It is closely related to, and resembles, the prickly salt wort of the sea-beaches and in no way, except spininess, can be confounded with the true thistles. It is a glabrous, succulent, spreading bushy herb, with slender branches and small linear leaves, topped by a prickle, and usually bright red at maturity. Its small flowers are single in the axils, and are succeeded by hard little fruits surrounded by broad, the five-parted horizontal wing of the calyx, which is conspicuously veined. Like many desert plants, at

maturity, and in the dry season, its branches contract into a ball, enclosing its capsules full of ripe seeds, and it becomes a "tumble-weed," blown across the country by the wind, and scattering its seeds, to take root in favorable soils. Careful cultivation is the best way to exterminate the Russian thistle.

RUSSO-JAPANESE WAR. See JAPAN.

RUSSO-TURKISH WARS. Ever since the conquest of Constantinople by Mohammed II in 1453, the Turks had been regarded as a perpetual menace to the Christian countries of Europe. The remarkable military achievements of the Osmanli; their enormous encroachments upon European territory, and, above all, their utter incapacity for equitable administration, plus the insuperable difference in race, creed and language, made them most undesirable neighbors to the Slav, Greek, Magyar, Latin and Teutonic peoples of southern and south-eastern Europe. In 1547 the Turks acquired Serbia; Trebizond and Sinope in 1461; Wallachia in 1462; Bosnia in 1463; the Crimea in 1475; Albania in 1479; Otranto in 1480. Bayazid II (1481-1512) took Venice and parts of the Morea; Selim I (1512-20) made his fleet the terror of the Mediterranean, while his successor Suleyman the Magnificent captured Belgrade, Rhodes and Lower Hungary; his triumphant progress was arrested only at the walls of Vienna in 1529. By the first peace treaty between Austria and Turkey (22 June 1533) the sultan received the right to sanction any arrangement about Hungary. In 1534 Suleyman attacked Charles V in the Mediterranean and made the Turks supreme in both the eastern and western basins of that sea. The Turkish fleet attacked Italy in 1537, and Venice was compelled to make a truce with the Porte in 1539. Hungary was invaded for the fourth time in 1541 and a Turkish government was established at Buda; further places were seized in Hungary, Croatia and Slavonia in 1544; Szegedin fell in 1552, and Chios in 1566. In 1571 Pius V organized the Holy League against the Turks, who captured Cyprus from Venice. But the turn of the tide was at hand. The battle of Lepanto (October 1571) shattered the reputation of invincibility which the Turkish fleet had attained, and in 1573 a new and formidable adversary appeared in the lists against Turkey—the power of Russia. The first proper Russo-Turkish War came in 1678; it ended in 1682 and secured the Ukraine and the Cossack territory to Russia. Other wars followed: in 1686 Russia began operations; two years later Transylvania renounced Turkish suzerainty and became a province of the king of Hungary, and in 1689 Russia joined forces with the Imperialists to fight the Turks on the Danube. In 1710, at the instigation of Charles XII, the Sultan Achmet III declared war on Russia. By the treaty of the Pruth (21 July 1711) Peter the Great gave back Azov to the Turks, destroyed all Russian fortresses on Turkish territory and made a definitive treaty of peace with Turkey in 1713. In 1715 the Turks conquered the Morea and the Venetian fortresses in Crete; in 1716 the Austrian Imperialists defeated the Turks at the battle of Peterwardein, and Temesvar, the last of the Turkish possessions in Hungary, fell 13 August.

In 1726 Russia and Austria formed an offensive alliance for 30 years against Turkey, though the projected war did not break out until 10 years later, in 1736, and lasted three years, during which time the Turks recovered Nissa from the Austrians, captured Orsova, won the battle of Crocyka, and compelled peace. By the Treaty of Belgrade (18-23 Sept. 1739) Austria ceded Orsova, Belgrade and all territories gained by the Treaty of Passarowitz (1718), viz., a strip of Serbia and the Banat of Temesvar, while Russia ceded all her conquests except Azov, which was to be dismantled. A treaty of neutrality was concluded between Turkey and Russia in 1748, but in 1767 Russian agents began to stir up the Greeks, Montenegrins and Bosnians against the Turks, who declared war against Russia in October 1768. The struggle raged for nearly six years; the Russians defeated the Turks and occupied Moldavia and Bucharest, but their initial successes were checked by a Turkish victory and a revolt among the Don Cossacks, so that the tsar solicited the mediation of Austria in 1773. By the peace of Kutchuk Kainardji (July 1774) the Tartars were brought under Russian influence; Russia gained an embassy at Constantinople and secured privileges for the Christians; she exacted promises of better government for the principalities, the right of free commercial navigation in Turkish waters, and gained a firm footing on the northern shores of the Black Sea. Austria obtained Bukovina from Turkey—after forcible occupation—in 1775. Yielding to Russian demands, Turkey ceded the Crimea and Kuban to Russia in 1784, and on 10 Aug. 1787 Turkey once more declared war on Russia, which was followed by Austria declaring war on Turkey 9 Feb. 1788. The Russian troops gained several successes, but the campaign proved unfavorable to the Austrians. Their united forces defeated the Turks at the battle of Fokshani (31 July 1789), and at Rimnicu (22 Sept. 1789); the Turks lost Belgrade, Bucharest, Bender and Akerman. Austria made peace 4 Aug. 1791 and took Orsova; Russia continued until 9 Jan. 1792, when she also made peace in order to devote her strength to the war with Poland. While Europe was ablaze with the Napoleonic wars, Russia and Turkey again came to grips in November 1806. England joined Russia and a British fleet forced the passage of the Dardanelles. In 1808 Russia submitted peace terms to the Porte; they were rejected, and another war began in April 1809. The Russians seized Tultcha and Ismail on the Danube and drove the Turks from Rustchuk, which the Russians set on fire in 1811. A Turkish army in Wallachia surrendered. Russia made peace on 28 May 1812 on terms favorable to her enemy in order to repel the threatened invasion of her own dominions by Napoleon. Turkey lost part of Bessarabia and Moldavia, and acknowledged the principality of Serbia.

After the fall of Napoleon the Greek struggle for independence from Turkey claimed the attention of the European powers. On 20 Oct. 1827 the combined fleets of England, France and Russia inflicting a crushing defeat on the Turkish navy in the Bay of Navarino and made Greece a free country. On 26 April 1828 Russia again declared war on Turkey, crossed the

Danube, captured Varna and Silistria, and forced peace by the Treaty of Adrianople (14 Sept. 1829), by which the independence of Greece was recognized by Turkey and Russia gained some islands and a strip of territory in Asia Minor, besides securing free navigation of the Black Sea for commerce. Wallachia and Moldavia (now Rumania) received separate administrations, Serbia was recognized as a vassal state, and Turkey was mulcted in an indemnity of 10,000,000 ducats. Russia became possessed of the whole eastern coast of the Black Sea, with the free navigation of the straits, and obtained complete command of the chief mouths of the Danube. She also secured the protectorship of the Greek Church throughout the whole of Turkey. The Anglo-French-Russian coalition against the Ottoman Empire produced unfortunate results. While from the European point of view it was good and proper that the grip of the Turk should be relaxed from Christian territories in Europe, the repeated interventions of the powers in Turkish internal affairs had bred suspicions and rivalries among those powers themselves. Russian designs on Constantinople aroused the smoldering hostility of her allies of Navarino and produced the Crimean War (q.v.), which was strictly a Russo-Turkish War. The gradual dismemberment of the Turkish Empire in Europe proceeded over a period of 350 years and reached its climax in the Balkan Wars (q.v.) of 1912-13. Before 1875 Turkey had lost Transylvania, Azov, Moldavia, Wallachia, Serbia, Greece, Bessarabia, Bukovina and the Crimea, besides Asiatic territories and active control of Egypt, retaining in some cases a shadowy suzerainty.

The Russo-Turkish War of 1877-78 directly originated from a revolt that broke out in Herzegovina during July 1875 against Turkish oppression, though in reality it was but a continuation of the age-long quarrel between the two countries—their 10th war. It was the most determined attempt hitherto made by Russia to force a solution of the Eastern Question—"the nightmare of Europe." The insurrection was secretly supported by Serbia and Montenegro and encouraged by Russian agents. Severe conflicts between Christians and Mohammedans also broke out in Bosnia, and thousands of refugees fled to the Austrian frontier. The rapacity of Turkish tax collectors was mainly responsible for the outbreak. To Austria, any disturbance on her borders threatening the *status quo* was always a serious embarrassment. On behalf of Russia, Germany and Austria, Count Andassy (q.v.) drew up a scheme of reforms to be submitted to the Porte, insisting upon the abolition of tax-farming; the application of the direct revenue of Bosnia and Herzegovina for the benefit of those provinces; the establishment of religious liberty; the creation of a commission composed equally of Mohammedans and Christians to supervise the reforms, and the amelioration of agrarian conditions by the sale of land on easy terms to the peasants. Though accepted by the Porte, the Andrassy note failed of its purpose because it did not provide for supervision by the three emperors over the execution of the reforms. The insurgents refused to lay down their arms; England and Austria attempted

pacification, but the disaffection only spread. Diplomatic conferences were held with a view to avoid intervention when the crisis suddenly became aggravated by the murder of the German and French consuls in Salonica by a Turkish mob (6 May 1876). The Berlin Memorandum of 13 May insisted on the reforms and a two months' armistice; Italy and France accepted the memorandum, but England withheld consent and despatched a fleet to Besika Bay. The other powers also sent warships and compelled Turkey to punish the murderers of the consuls, but compensation could not be enforced owing to the chaotic condition of the Turkish finances. Midhat Pasha deposed the Sultan Abdul Aziz and placed Murad on the throne. Constitutional reforms were promised and a peaceful settlement seemed within reach. Meanwhile, an insurrection had broken out in Bulgaria and was suppressed by the Turks with unspeakable barbarity. The ruthless massacre of some 12,000 Bulgarians aroused a thrill of horror in Europe and inflamed popular passion. On 30 June Serbia declared war on Turkey; Montenegro followed suit on 2 July. Supported by Germany, Austria and Russia drew up plans for the partition of Turkey. The Serbians were defeated when Russia intervened with an ultimatum demanding effective protection for the Christians and a two months' armistice. Abdul Hamid II, who had meanwhile succeeded Murad V (deposed and exiled), accepted the Russian terms, but at the same time energetically prepared for the coming struggle. To allay British anxiety, the Tsar Alexander II disclaimed all desire for territorial aggrandizement, but stated clearly that he would act alone if the reforms were not carried out. Lord Derby proposed a conference of the Powers at Constantinople. Warlike preparations were hurried on all sides; England threatened to occupy Gallipoli and Constantinople if Russia occupied Bulgaria. A conference of the Powers assembled at Constantinople 12 Dec. 1876, with the twofold object of preserving the integrity of Turkey and of pressing the desired reforms. The demands for a foreign commission and a European control over the appointment of governors were entirely rejected, and the conference broke up in failure.

On 31 Jan. 1877 Russia asked the Powers what they now intended to do. England suggested a year's probation, and by her advice the sultan made peace with Serbia, 28 Feb. 1877. At the instance of Russia the London Protocol was signed 31 March and presented to the Porte, once more demanding the reforms and also peace with Montenegro, which still continued the war. The Protocol was rejected by Turkey, and on 24 April Russia declared war, England declared strict neutrality so long as the Suez Canal was not interfered with, Constantinople not occupied, and the Bosphorus and Dardanelles left untouched. The Russian army consisted of 164,000 men in the Caucasus, 56,000 on the coasts of the Black Sea, and 136,000 in Bessarabia. The army intended for the Danubian territories rose by 15 June to 216,000 men. The navy was composed of 13 ironclads, three frigates and a dozen monitors. The Turkish army of the Danube, under Abdul Kerim Pasha, was composed of about 160,000

men; Osman Pasha had 35,000 at Widin, and some 100,000 were spread among the fortresses of Shumla, Rustchuk, Silistria and Varna. Some weak divisions lay in the Dobrudja and the rest at Tirnova and Shipka. Reserves were being concentrated at Sofia and Constantinople; 15,000 stood on the Serbian frontier and in Bosnia-Herzegovina; 25,000 facing Montenegro; and other troops in Albania and Macedonia. The Danube flotilla consisted of four armored corvettes, nine monitors, five armored gunboats and five other gunboats. The Russians under the Grand Duke Nicholas crossed the Pruth in April, and the Danube in June, and soon put the Turkish flotilla out of action. A convention signed 16 April 1877 between Russia and Rumania (the latter a vassal of Turkey) gave the Russians free passage and use of Rumanian railways and telegraphs. The first fighting occurred in Asia, where the Russians under Loris Melikov advanced on Batum, Kars and Bayazid, meeting with fierce resistance and several defeats. In Bulgaria they were more successful, where Gourko seized the Shipka Pass, crossed the Balkans, and threatened Adrianople; other armies marched on Rustchuk and one took Nicopolis. Russian successes now caused anxiety in England; a squadron was sent to Besika Bay and Malta was reinforced. Osman Pasha took Plevna (q.v.) and strongly fortified it. Here, with a force of about 50,000 men he repulsed all attacks of the Russians and Rumanians for three months, when he was compelled to surrender, 10 Dec. 1877. The whole country, from the Balkans to the Danube, gradually fell into Russian hands. In Armenia the Russians had retrieved their early failures and taken Kars. The Montenegrins captured Dulcigno, Antivari and Nikitch; Crete rose in rebellion and demanded union with Greece; the insurrection in Bosnia-Herzegovina continued, Thessaly and Epirus were in revolt, and the Serbians again rose in arms. The sultan's efforts to enlist European mediation met with no response; he then appealed to Queen Victoria, who obtained an assurance from the tsar that he would listen to a direct appeal from Turkey. Accordingly, Russo-Turkish plenipotentiaries met at Kasanlik on 19 Jan. 1878. An armistice was granted on 31 January and peace preliminaries signed. England's attitude had meanwhile verged on the fringe of war with Russia; it was known that she would forcibly oppose a Russian occupation of Constantinople. A British fleet passed through the Dardanelles and anchored a few miles below Seraglio Point. The Treaty of San Stefano between Russia and Turkey was signed 3 March 1878. By its provisions Montenegro, Serbia and Rumania were made independent; Russia took Bessarabia and gave Rumania the lower Dobrudja (Turkish), as compensation; Bulgaria received an accretion of territory and was created an autonomous principality tributary to Turkey; the reform program of 1876 was to be carried out with regard to Bosnia-Herzegovina; Crete and the remaining Christian provinces were to have improved administrations, and the Armenians were to be protected against the Kurds. Also the Dardanelles and the Bosphorus were to be open to the merchant ships of all nations in peace and war times. So far, the terms of the treaty were

acceptable both to England and Austria, but those two powers firmly opposed the other conditions laid upon the Porte, namely, an indemnity 1,400,000,000 rubles (\$740,147,450), coupled with the stipulation that Ardahan, Kars, Batum, Bayazid and the territory between the Russian frontier and the Soghanly Mountains be ceded to Russia in consideration of 1,100,000,000 rubles (\$581,544,425) being remitted from the indemnity, owing to Turkey's weak financial position. England demanded that every article of the treaty should be laid before a congress to be held in Berlin. Russia's refusal made war imminent. Lord Beaconsfield ordered the mobilization of the British army and navy and summoned troops from India; Austria voted a war fund and prepared to occupy Bosnia. After some diplomatic conversations Russia decided to accept the British and Austrian demands, and the Berlin Congress (q.v.) met on 13 June 1878. Nine days earlier Lord Beaconsfield had concluded a convention with Turkey engaging to aid against future aggressions by Russia, if the sultan would carry out the necessary reforms. Great Britain received Cyprus to be held by her until Russia restored her Armenian conquests. The Congress tore up the treaty of San Stefano, substituting for it the famous treaty of Berlin signed 13 July 1878. Montenegro, Serbia and Rumania were confirmed in their independence; the first-named received the ports of Dulcigno and Antivari; Serbia and Rumania received accessions of territory and Bulgaria north of the Balkans was made autonomous. Bosnia and Herzegovina were handed over to Austria to be administered until such time as Turkey would be able to assume that task on more enlightened principles. Russia retained Batum and Kars in Asia, but restored Bayazid; she also acquired Bessarabia and a part of Armenia. England secured Cyprus, and France a lien on Tunis. Pecuniary indemnities were excluded altogether. The results of the congress and the treaty were not calculated to increase friendly relations between the powers. Each of the contracting parties, as well as the beneficiaries, was left with a national or territorial grievance. Turkey had been despoiled by friends and enemies alike; Russia had been checked, Greece ignored and the aspirations of the Balkan principalities unrealized. The elaborate stipulations for the protection of Christian subjects of Turkey were never observed. See BALKAN LEAGUE; BALKAN WARS; BOSNIA; BULGARIA; RUMANIA; RUSSIA; SERBIA; TURKEY; WAR, EUROPEAN; RUSSO-TURKISH CAMPAIGN; AUSTRIA AND THE WAR.

HENRI F. KLEIN,
Editorial Staff of *The Americana*.

RUST, ferric oxide, formed by the gradual oxidation of iron when exposed to the air. Carbon dioxide is, if not a necessary factor, a powerful accelerant of the action. To remove rust the usual mode is to rub the object with a piece of oiled rag or emery paper. More rapid and more satisfactory results are secured by using very pure petroleum, and wiping with a hempen or woolen rag. To prevent rust, dip iron or steel articles in a mixture of equal parts of carbolic acid and olive-oil, rubbing the surface with a rag. Others rub the metal with a mercurial ointment, leaving a thin layer of mercury over the entire surface. If iron be dipped in a solution of carbonate, chromate or bichromate of potash or soda in water the surface will be protected by a tenacious film of oxide against rust for a long time, and objects can be protected for any period by burying in quicklime. Rubbing the surface with plumbago has a similar effect.

RUSTCHUK, roos'chook, Bulgaria, a town on the right bank of the Danube, at the confluence of the Lom, opposite Giurgevo, 42 miles southwest of Bucharest. It has some woolen, silk and other manufactures and considerable trade. It was of strategic importance owing to its position on the old Turkish frontier, and was almost destroyed by the Russian bombardment in the War of 1877-78.

RUSTON, La., city and parish-seat of Lincoln Parish, 165 miles northwest of Baton Rouge, on the Chicago, Rock Island and Pacific, and the Vicksburg, Shreveport and Pacific railroads. There are cotton and lumber interests, and the Louisiana Industrial Institute is located here. It is also the home of the Louisiana Chataqua, and has a high school, orphanage and a fine post office. Pop. 3,377.

RUSTS. See FUNGI.

RUTABAGA. See TURNIP.

RUTACEÆ, roo-tā'sē-ē, a widely dispersed family of polypetalous plants with about 950 species, most frequent in warm regions, and

especially so in South Africa and Australia. They are generally shrubs or trees, bearing leaves in various forms, without stipules, dotted with glands and often heavy-scented. The four- or five-parted flowers are often in axillary cymes and the fruits are various, being most conspicuous in the genus *Citrus*, which produces the orange and lemon. Two American genera are *Ptelea* (hop-tree), and *Zanthoxylum*, or prickly ash. The latter is represented by small trees, prickly, with a powerfully stimulative and tonic bark. The common rue is a member of the typical genus *Ruta*.

RUTGERS, Henry, American philanthropist: b. New York, 7 Oct. 1745; d. there, 17 Feb. 1830. He was graduated from Columbia in 1766; served as captain in the Revolutionary War and later as colonel of New York militia, and entered the legislature in 1784 to which he was frequently re-elected. He was a member of the board of regents of the New York University from 1802 to 1826. His gifts to public purposes were many, the chief being \$5,000 to Queen's College of New Jersey, which thereupon took the name of Rutgers.

RUTGERS COLLEGE, located at New Brunswick, N. J. It was chartered in 1766 under the name of Queen's College; the charter was slightly altered in 1770. In 1771 the college was located at New Brunswick. During the Revolutionary War, when the British army occupied New Brunswick, the college exercises were continued at Millstone and at North Branch. The present site of the college was secured in 1808, and in 1825 a generous donation was received from Col. Henry Rutgers, and the name changed to Rutgers College in his honor. A theological school was at first affiliated with the college, but has since become an independent institution. There is a preparatory school, established at the same time with the college. The organization of the collegiate department now includes two schools, the classical school and the Rutgers Scientific School. In 1864, the legislature designated "The trustees of Rutgers College in New Jersey maintaining the Rutgers Scientific School" as the State College of Agriculture and Mechanic Arts; the Scientific School thus became the beneficiary of the Congressional land grant of 1862, and of the appropriation law of 1890. In the classical school the work of the freshman and sophomore years is required, while two courses are elective for junior and senior years; the degrees of A.B. and B.L. are conferred. In the Scientific School the studies of the freshman year are the same for all courses; at the end of that year the student elects one of the six courses offered, certain subjects, such as English, history, political economy, etc., being required in all. The six courses are agriculture, civil engineering, and mechanics, chemistry, electricity, biology, clay-working and ceramics. All courses lead to the degree of B.S. There is also a special two years' course in ceramics. Military drill is required of all students in the Scientific School. The school conducts a university extension department, and the State agricultural experiment station is connected with it. The Scientific School is under control of the college board of trustees of which the governor, the chief justice and the attorney-general are members ex officio; and is also under the super-

vision of a State board of visitors appointed by the governor. The college farm contains 100 acres and is well equipped with modern apparatus. The buildings on the campus include Queen's College, Fine Arts Building, Van Nest Hall, Geological Hall, Kirkpatrick Chapel and Library, State Laboratory, Ceramics Building, Winants' Hall (dormitory) and the Balantine Gymnasium. The library in 1915 contained some 80,000 volumes; the students in the collegiate department numbered 475 and the faculty 55, besides special teachers. The college also conducts a summer school and extension lectures and during the past 20 years has more than doubled its enrolment.

RUTGERS SCIENTIFIC SCHOOL, a department of Rutgers College, New Brunswick, N. J., designated by law as the New Jersey State College of Agriculture and Mechanic Arts. See **RUTGERS COLLEGE**.

RUTH, Book of. The Book of Ruth is one of "the five Megilloth" (Rolls) which constitute a portion of the third division in the Hebrew Canon, "the Writings." The book is a story of the time of the Judges, with the Moabitess Ruth as the heroine, narrated with simplicity and charm. It was evidently written much later than the time of which it treats. That time belongs to the past, i, 1, as also that of King David, iv, 17. The custom described in iv, 7 is so fully obsolete as to need explanation. The language is for the most part good Hebrew, but words found here and there indicate lateness; this is not confined to iv, 18-22, probably a later addition. Its place in "the Writings" rather than in "the Prophets" also indicates late composition. These considerations make it probable that the time of writing was after the exile. The purpose of the book, as will be noted, doubtless limits the time more definitely.

Two features are specially prominent in the treatment of the book: the descent of David from a Moabitess, and the inculcation of the duty of the nearest of kin to marry the widow of a man who died without a male child. The purpose doubtless included both elements. The second has no specific indication of time. The custom here described is broader than that of Deuteronomy xxv, 5-10, where the duty is limited to a brother of the deceased. The first feature, however, affords a more definite suggestion of time. Deuteronomy xxiii, 3 forbids unto the tenth generation the entrance of the descendant of a Moabitess into the assembly of Yahweh. The activities of Ezra and Nehemiah were directed especially against marriage with foreign wives, Ezra ix-x, Nehemiah xiii, 23-29. It must be remembered that the book makes frequent mention of the fact that Ruth is a Moabitess, and in ii, 10 she calls herself a foreigner. The attitude of the book is thus in direct opposition to the regulations which found their fullest expression in the time of Ezra and Nehemiah, the middle of the 5th century. The most probable time for the book, therefore, is not long after the period of Ezra and Nehemiah, the book, at least partly, being designed as a protest against the attitude which they represented. This book is, therefore, one of the evidences that along with the narrowness of the dominant postexilic view there persisted a broader conception of Judaism, which,

in some of its other phases, appears also in the books of Jonah and Proverbs, and elsewhere.

The treatment of the author has an idealizing element. His presentation of the peaceful village life of the time of the Judges is in marked contrast with the turbulence of the period as reflected in the Book of Judges. The probability of a historical basis for the story, however, is indicated by the connection of David with Moab suggested in 1 Samuel xxii, 3-4. The tradition on which the book is based was doubtless preserved in the family of David.

Of suggested later additions the only one that seems probable is iv, 18-22. The decisive reason here is not the abundance of marks of lateness in the language of these verses, but rather the fact that here Obed is treated as the son of Boaz; in the book itself (iv, 5, 10), he is regarded as legally the son of Mahlon, according to the ancient custom. The addition of these verses was evidently prompted by a genealogical interest.

GEORGE RICKER BERRY,

Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

**RUTHENES, RUTHENIANS, RUSS-
NIAKS, or LITTLE RUSSIANS**, are Slavonic tribes inhabiting Eastern Galicia, Bukovina and the neighboring districts of Hungary. They are part of the "Little Russians" who dwell in the Ukraine. The number of Austrian Ruthenes amounts to about 3,500,000; according to some authorities there are over 4,000,000, of whom 500,000 are settled in the northeast provinces of Hungary, 300,000 in the northwest of Bukovina, and the remainder in Galicia. The name "Ruthene" is merely the German and Austro-Hungarian title for "Ukrainian"; by whatever name they are called, they are one people, and form a racially compact mass of some 30,000,000 souls, extending from the Dnieper to the Carpathians into Hungary. Russia regards the Little Russians as an integral part of the Great Russian family and their language as a Russian dialect. Austria, on the other hand, encouraged the Ruthenes to regard themselves as a separate Slav race and their language as a distinct Slav idiom. As Rambaud has pointed out, some writers have been anxious to establish the existence of a profound difference between the Great Russians and their two neighbors, the White and the Little Russians. The dialectical differences between the idioms of these three families are easily traceable to historical and literary influences. The Little Russian dialect is spoken by over 26 per cent of Russian-speaking races.

The Carpathian Ruthenes are divided into Boiki, Lemki, Gutsuli and Ugorski Ruthenes. Of these the Boiki inhabit the central portion of the northeastern slope of the Carpathians. They wear long hair and are sometimes clean-shaven—in marked contrast to the Slavs of Russia proper. Their chief occupation is cattle-breeding. The Lemki live between the northern frontier of the Boiki as far as the river Poprad. They are much under the influence of the Slovaks and their dress differs considerably from that of the other Ruthene tribes. Their hair is cropped short and their faces are always clean-shaven. The Gutsuli inhabit the southwestern region of East Galicia, West Bukowina, and southeastern Ugorsakya Rus, forming in reality a single people divided into three by political boundaries. Dwelling in remote mountain districts they alone among the Austro-Hungarian Ruthenes escaped seridom and developed among themselves a comparatively high degree of well-being. Their manner of life has fostered among them the love of arms and a fondness for finery in dress. To a greater degree the Gutsuli have preserved their ancient heritage in dress and habits than other Ruthene tribes. The Ruthenes of the Galician plain reproduce in their dress and buildings the more typical features of life in the neighboring Volhynia and Podolia provinces of Russia, whereas in Bukowina the obtrusion of Rumanian influence is marked. The Ruthenian peasants of Eastern Galicia live in wretched circumstances; they are mere farmhands tied to the soil by a miserable pittance from the Polish gentry, who own much of the land and hold practically all administrative posts. The bulk of the Ruthenes belong to the Uniate Church, which means that they acknowledge the Pope, but retain the outward forms of the Greek Church and have married priests. Despite the published official statistics, it is the Ruthenes and not the Poles who are in the majority within Galicia. Under the new franchise law of 1907 the Poles obtained 78 seats in the new Parliament, while the Ruthenes were given 28 seats. By a compromise effected in February 1914 the Ruthenes were guaranteed a representation of 27 per cent in the legislature. Yet the Ruthenes were in many respects better off under Austrian than Russian rule. They were permitted their own schools (about 2,500), social and political clubs and their own language and literature. Owing to this fact much of the Ukrainian propaganda in Russia had been directed from Lemberg during recent years. The University of Lemberg, established by the Emperor Joseph II for the Ruthenians alone, was appropriated by the Poles. Protests led to wholesale imprisonment, though latterly the number of Ruthenian professors had been increased. According to statements by the Ruthenian National Union (New York) the Ruthenes "felt in recent years that there was hope for their cause within the Austrian monarchy." The policy of both Russia and Austria-Hungary had long been directed toward keeping the closely-related Ruthenians and Ukrainians apart. The collapse of those empires in the course of the war brought about the formation of a new nation, the Ukraine, which included the Ruthenian section of Galicia. See UKRAINIANS.

RUTHENIUM, a metal of the platinum group. It has the atomic weight 101.7, and the symbol Ru. Some specimens of platinum ore contain from 3 to 6 per cent of ruthenium. It is a whitish-gray metal, having a specific gravity of 11 to 11.4 and after fusion of 12,063; is very fusible, more so than any other metal except osmium; is scarcely attacked by nitromuriatic acid, but is more easily oxidized by fusion with nitre, chlorate of potassium, etc. than platinum. Ruthenium forms a series of salts which are analogous to those of platinum.

RUTHERFORD, rúth'er-ferd, N. J., borough in Bergen County, on the Erie Railroad, about nine miles from New York and seven miles southeast of Paterson. It is a residential place, occupied chiefly by business men from New York. Several electric lines connect the borough with many of the cities and boroughs in the vicinity. Its principal public buildings are churches, schools and a public library. Pop. about 8,500.

RUTHERFORD, Sir Ernest, Canadian physicist; b. Nelson, New Zealand, in 1871. He was educated at Nelson College and the University of New Zealand, and at Trinity College, Cambridge, England. He was awarded the 1881 Exhibition Science Scholarship in 1895 and from that time until 1898 worked at research in the Cavendish Laboratory, Cambridge, in the latter year being appointed professor of physics in McGill University, Montreal. In 1903 he was elected a Fellow of the Royal Society; in 1904 delivered the Bakerian lecture before the Royal Society and was awarded the Rumford Medal; in 1905 delivered the Silliman lectures at Yale University. Since 1907 he has been Langworthy professor and director of the physical laboratories of Manchester University, England. In 1908 he was awarded the Nobel prize for chemistry and in 1914 he was knighted. He has published 'Radioactivity' (Cambridge University Press 1904); 'Radioactive Substances and their Radiations' (1913).

RUTHERFORD, Lewis Morris, American astronomer; b. Morrisania, N. Y., 25 Nov. 1816; d. Tranquility, N. J., 30 May 1892. He was graduated from Williams College in 1834, admitted to the bar in 1837, and practised law in New York until 1849. He then devoted himself to the study of science, making valuable investigations in the departments of astronomical photography and spectral analysis. He made several instruments for use in his laboratory, among which were an abject glass, a micrometer for measuring astronomical photographs and a dividing engine (q.v.) of great value. He was a trustee of Columbia University from 1858-64, when he resigned and presented his astronomical instruments to that institution where they are now mounted, and was also one of the original members of the Academy of Science.

RUTHVEN, rúth'ven (Scotch ríth'ven), Raid of. See GOWRIE CONSPIRACY.

RUTILE, titanium oxide TiO₂, in tetragonal form, the chief source of titanium; also used as a gem and for coloring matter for porcelain, artificial teeth, etc. Mined in Virginia.

RUTLAND, Mass., village and township in Worcester County, 75 miles west of Boston,

on the Boston and Maine Railroad. It was settled in 1716, and became a town in 1722. After the surrender at Saratoga, part of Burgoyne's troops were quartered here in 1777-78; and the town was the home of Rufus Putnam in 1781-87. The State hospital for tubercular patients is located here, as are the prison camp and hospital. There are several private *sana-toria*. Pop. 1,743.

RUTLAND, Vt., city, county-seat of Rutland County; on the Otter and East creeks, and on the Rutland and Burlington and the Delaware and Hudson railroads; about 56 miles south-southwest of Montpelier, the State capital, and about 62 miles south by east of Burlington. It was settled in 1770 by persons from the East having been incorporated in 1761, by New Hampshire. It was chartered as a city in 1892. Rutland was in the battle region of the War of the Revolution. Two forts were erected here, as it was situated on the Great Northern Military Road. In 1781 it was made the capital of the county, and from 1784 to 1804 it was one of the State capitals. The old boundaries included an area of 26,000 acres with the Green Mountains on the east and the Taconic Range on the west. In 1886 the towns of Proctor and West Rutland were set off from Rutland. The new towns have independent governments, but all are united commercially. Rutland is in an agricultural region, but is well known for its extensive marble quarries and industries connected with the shipment of marble. Iron ore, fire-clay and slate are found in the vicinity. The marble works have been of considerable importance since 1830. The quarries are now in the new towns, but the industries continue as formerly. The chief industrial establishments of Rutland are manufactories, in which are made machinery for quarrying, and channeling marble, machine shops, engine and boiler works, Howe's scale factory, sash, door and blind factories, butter and cheese factory machinery, lumber and brick yards, sugar evaporator works, creameries and flour and grist mills. The principal buildings are Memorial Hall, built in honor of the soldiers of Rutland who fell in the Civil War, Baxter Memorial Hall, the government building, the county courthouse, city-hall, house of correction, opera house, bank buildings, churches and schools. The material for the construction of Memorial Hall was donated by the marble quarry companies and the cost additional was \$60,000. The educational institutions are a high school, Saint Joseph's Academy, public and parish graded schools, the Rutland Free Library and Baxter Memorial Library. The city is well equipped with banks, newspapers, and wholesale and retail business establishments. Pop. (1919) 14,417. Consult Hemingway, 'Gazetteer of Vermont'; Moore, 'Churches of Rutland, Vermont.'

RUTLEDGE, rūt'lēj, Edward, American soldier and legislator: b. Charleston, S. C., 23 Nov. 1749; d. there, 23 Jan. 1800. He was admitted to the bar in 1773, established a practice in Charleston and in 1774 was elected to the Continental Congress. He was a signer of the Declaration of Independence in 1776 and a member of the first board of war. In this capacity he was delegated with John Adams and Benjamin Franklin to confer with Lord Howe

on the subject of a reconciliation, but declined to treat with him excepting on the basis of American independence. As lieutenant-colonel of the Charleston artillery he assisted in expelling the British from Port Royal in 1779 and in 1780 was captured. After his release a year later he resided in Philadelphia, was a member of the Jacksonborough legislature in 1782, and after the war returned to Charleston where he resumed his law practice. He was for many years a member of the State legislature, was elected United States Senator in 1794 and governor of South Carolina in 1798. Consult McCrady, 'South Carolina in the Revolution' (1901-02).

RUTLEDGE, John, American jurist: brother of Edward Rutledge (q.v.); b. Charleston, S. C., 1739; d. there, 23 July 1800. He studied law in England, returned to Charleston in 1761 and there established himself in law practice. From the outset of his career he was an ardent opponent of the oppressive laws governing the colonies and as delegate to the congress at New York in 1765 openly advocated the united resistance of the colonies. In 1774 he was a member of the South Carolina convention which carried a resolution that South Carolina should be represented in the Continental Congress. He served as delegate to the Congress of 1775 and in 1776 was chairman of the committee that framed the South Carolina constitution, was elected president of the State government and commander-in-chief of the militia. When the British forces arrived off Cape Fear he fortified Charleston and prevented the invasion of the State. He resigned his office in 1778 through dissatisfaction with changes in the constitution, but was recalled in the following year and invested with dictatorial authority. He at once set about preparations for defense and held the city until 1780. He then joined the forces of General Greene and upon the recapture of Charleston resumed his duties as governor. In 1782 he was elected to the Continental Congress, was re-elected in 1783 and in 1784 became chancellor of South Carolina. He was a member of the convention which framed the Constitution of the United States in 1787. He became chief justice of his State in 1791 and in 1795 was appointed chief justice of the Supreme Court. His mind failed in the following year and he held no further public office.

RUTTAN, Robert Fulford, Canadian chemist: b. Newburgh, Ontario, 1856. He was educated at the universities of Toronto, McGill and Berlin. From 1887 he was connected with the faculty of McGill University, occupying the chair of organic and biological chemistry there in 1902-12, since when he has been director of the department of chemistry. He has made many important contributions to the knowledge of medical chemistry. Author of 'Artificial Alkaloids'; 'Glycol Fats'; 'Physical and Chemical Constants of Margarinic Palmitic and Stearic Acids', etc.

RUWENZORI, roo-wēn-zō'rē, a group of mountains in Africa, north of the equator, discovered by Stanley in 1888, in his great journey from the west to the east coast, when he rescued Emin Pasha. It is a chain of heights about 16,000 feet in elevation, is clad with snow and

Copyright by C. E. Anderson, Sec'y, 1901

JOHN RUTLEDGE

Chief Justice of the United States Supreme Court, 1795

traversed by large glaciers. It lies about 200 miles to the westward of the Victoria Nyanza and between the Albert Nyanza and Albert Edward Nyanza. The river Semliki, which connects the two lakes, flows in a valley near the range. The snow-line is about 13,000 feet above sea-level. These mountains are sometimes identified with the Mountains of the Moon, spoken of by ancient writers.

RUY BLAS, by Victor Hugo, has held the stage better than any other of his dramas and has been popular in America also in the adaptation 'Don César de Bazan.' Here Hugo's dramatic theory of contrast of grave and gay, rapid alternation of tragic and grotesque, is pushed to its utmost verge. The scene is Madrid; the time 1699. Don Salluste de Bazan, scorned by Maria de Neubourg, second wife of the do-nothing King, Charles II, plots revenge. Failing to enlist the aid of his scape-grace but chivalrous cousin, Don César, he introduces his valet, Ruy Blas, to the court as his kinsman. Ruy Blas loves the queen and through her sympathetic interest gains official preferment which he uses for political and fiscal reform. The long speech, 101 lines, in which he contrasts the sordid struggle for sinecures in a decaying monarchy with the glories of Charles V ranks among the most brilliant tirades of the French drama. The queen and Ruy Blas are betrayed into a compromising situation by Don Salluste, who, when Don César threatens to balk his revenge, ruthlessly sacrifices his cousin to his injured vanity. Ruy Blas kills Don Salluste and then himself, consoled that his death has extorted from the queen an admission that love has overcome all prejudice of rank or station. This play, which Hugo says he began to write on 4 July 1838, has, except for the dénouement, constant and perplexing likeness to Bulwer's 'Lady of Lyons,' first acted 14 Feb. 1838. The idea of a valet set by a scorned lover to woo a fine lady had been turned to dramatic account in Molière's 'Précieuses ridicules'. Hugo certainly used Latouche's 'La Reine d'Espagne' (1831). In his very inaccurate 'V. Hugo raconté par un témoin de sa vie' he notes as sources the 'Mémoires' of Madame d'Aulnoy (1690), 'Solo Madrid es corte' (1675) and Vayrac's 'État présent d'Espagne' (1718). How carelessly he used all these is shown in detail by Morel-Fatio, 'Études sur l'Espagne' (Vol. I., pp. 177-244). 'Ruy Blas' is translated in 'Dramatic Works of Victor Hugo' (London 1913) and in 'Dramas by V. Hugo' (Boston 1903). Consult Biré, 'V. Hugo après 1830' (Vol. I, pp. 236-251) and Bruner, 'Studies in V. Hugo's Dramatic Characters' (pp. 32-129, Boston 1908).

BENJAMIN W. WELLS.

RUYSBROECK, rois'brék, or **RUS-BROEK**, roos'brök, Jan van, Dutch mystic: b. Ruysbroeck, 1293; d. Grönendal, 1381. He was educated at Brussels and for 26 years was vicar of the church of Sainte Gudule there. In 1353 he renounced the secular priesthood and entered the Augustinian monastery of Grönendal, in the forest of Soignies, where he became prior, lived a contemplative life and wrote his mystical works. His four principal works are 'Die Zierde der geistlichen Hochzeit'; 'Der Spiegel der Seligkeit'; 'Von dem funkelnden Stein'; and 'Samuel.' They were originally

written in Dutch and are regarded by his countrymen as among the best prose of the Netherlands during the Middle Ages. Translations were made into German, French and Latin. The four works cited were edited by Arnswaldt (1848); no collected edition has been made embracing his other works, which, however, are mainly restatements of the main features of the foregoing. Consult Engelhardt, 'Richard von S. Victor und Johann Ruysbroek' (1838); Ullmann, 'Reformatoren vor der Reformation.'

RUYSBROEK, Willem van (GUILLAUME DE RUBRUQUIS), Franciscan friar and traveler: b. Brabant, about 1215; d. some time after 1293. He was sent by Louis IX of France to Central Asia to bring about an alliance with Sartach, a supposed Christian prince of Kiptohak, then at war with the Saracens. In May 1253 he set out from Constantinople upon his mission with two other Franciscan friars and an interpreter; crossed the steppes, now a part of the Russian province of Ekaterinoslav, reached the banks of the Don, and, after many hardships, the camp of Sartach near the Volga. Refused permission to preach Christianity in Tartary, he made his way across the Caucasus into Armenia, Persia and Asia Minor, reaching Tripoli in Syria in August 1255. An account of the countries and peoples visited by these missionaries was written by Ruysbroek and sent to the French king. The best modern translation is that of Michel and Wright in Vol. IV of 'Receuil de voyages et mémoires de la société de Géographie' (1839).

RUYSDAEL, Jacob van. See **RUISDAEL**.

RUYTER, ri'tér (Dutch, roi'tér), Michael Adriaanzoon de, Dutch admiral: b. Flushing, 24 March 1607; d. Syracuse, Italy, 29 April 1676. He early entered the navy and rose from cabinboy to captain (1635). In 1641 he was placed as rear-admiral in command of a fleet sent to the assistance of the Portuguese, who had thrown off the yoke of Spain, and he was afterward employed against the Barbary corsairs. In the war between the Dutch and English, which was begun in 1652, Ruyter repeatedly distinguished himself, especially in the battle fought in February 1653, near the mouth of the Channel, in which Blake, commanding the English, defeated Tromp and Ruyter, who commanded the Dutch. He became vice-admiral of Holland after the death of Tromp in 1653 and afterward served against the Portuguese, the Swedes and the Algerines. He commanded in the great battle fought in the Downs in June 1666, against Prince Rupert and the Duke of Albemarle, where he was defeated, but in the following year made his memorable expedition up the Thames, when he destroyed Upnor Castle and burned some ships at Sheerness. He was made admiral-in-chief of the Dutch fleet and commanded at the battle of Solebay (Southwold Bay) in 1672, when the Dutch were defeated by the English under the Duke of York; but in the following year gained a victory over the combined English and French fleets. Consult 'Life' by Milne (1897).

RUZSKY, rooz'ski, Nicolas Vladimirovitch, Russian general: b. about 1854. He was educated at the Constantine military schools

and at the Nicolas General Staff Academy, served in the Turkish War of 1877-78, and in the Russo-Japanese War was quartermaster-general. At the outbreak of the European War Ruzsky was in command of the Russians Northern Army and conducted the brilliant military operations which led to the capture of Lemburg in September 1914, a feat for which he received honors from both England and France. He was retired because of ill-health in April 1915, but resumed his command in September. He was again relieved of his command in December 1915, although he retained his position in the council of the Empire and the supreme military council. He was again in command of the Northern Army in July 1916-May 1917, and was then relieved to be reinstated by Kerensky 14 Sept. 1917, as commander-in-chief of the Northern Army, taking up the difficult task of re-establishing discipline in the army under the disorganized conditions of the revolution.

RYAN, Abram Joseph, American poet and Roman Catholic clergyman: b. Norfolk, Va., 15 Aug. 1839; d. Louisville, Ky., 22 April 1886. He became a chaplain in the Confederate army shortly after his ordination to the priesthood, and served until the close of the war, afterward engaging in clerical labors in New Orleans, where he edited the *Star*. He subsequently removed to Knoxville, Tenn., and thence to Augusta, Ga., where he established the *Banner of the South*. He was later in charge of a parish in Mobile, Ala., but in 1880 went North where he engaged in lecturing and also supervised the publication of his poems, subsequently returning to the South. His works include 'The Conquered Banner and other Poems' (1880); 'Poems' (1880), etc.

RYAN, Edward George, lawyer and State judge: b. Newcastle House, near Enfield, County Meath, Ireland, 13 Nov. 1810; d. Madison, Wis., 19 Oct. 1880. Edward George was educated at Clongowes Wood College from 1820 to 1827 and removed to New York city in 1830, where he studied law, supporting himself by teaching. Admitted to practice in 1836, he removed in the same year to Chicago, Ill. In 1839 he became the editor, in that city, of the *Tribune*, Democratic in politics, which ended its career in 1841. During a portion of this editorial period he was prosecuting attorney of Cook County. He removed in 1842 to Racine, Wis., and in December 1848 to Milwaukee in the same State. While residing in Racine he was in 1846 a delegate to a convention at Madison, the capital of the then territory, which met to frame a State constitution. As a practitioner in Milwaukee he achieved great renown, especially in criminal cases and notably in 1853 in the impeachment before the State senate of Levi Hubbell, judge of the Second Judicial Circuit. On 7 June 1874 Mr. Ryan stepped from active practice at the bar to the position of chief justice of the Supreme Court. This was by executive appointment. In April 1875 he was elected by the people to the same office for a term to expire in January 1882 but did not survive to finish this term. Although a Democrat of the States' rights school, Mr. Ryan was always loyal to the government of the United States. The "Ryan Address" issued by him in 1862 did much to uphold the hands of the government in its struggle for existence.

RYAN, James, American Roman Catholic bishop: b. Thurles, County Tipperary, Ireland, 1848. He came to the United States when a child, studied for the priesthood at the seminaries of Saint Thomas and Saint Joseph, Bardstown, Ky., was professor at Saint Joseph's and after ordination served on the Kentucky mission for seven years. In 1878 he was appointed to a charge at Wataga, Ill., and afterward was for a time at Danville. He was rector of Ottawa from 1881-88, when he was consecrated bishop of Alton.

RYAN, John Augustine, American sociologist and theologian: b. Vermillion, Dakota County, Minn., 25 May 1869. He received his education in the public schools of Minnesota, at Saint Thomas College and Saint Paul Seminary, Saint Paul, and the Catholic University, Washington, D. C. Dr. Ryan was ordained to the priesthood in 1898 and from 1902 to 1915 held the chair of moral theology at Saint Paul Seminary, Saint Paul, Minn. Since 1915 he has been professor of moral theology and industrial ethics at the Catholic University of America, Washington, D. C. Dr. Ryan is recognized as an authority on social and labor questions, his moderation appealing effectively to all fair-minded persons. He is also very popular as a lecturer; is member of the American Economic Association, the American Association for Labor Legislation, the Minnesota Academy of Social Sciences, etc. His published works are 'A living Wage' (1906); 'The Church and Interest Taking'; 'Social Reform by Legislation'; 'Francisco Ferrer: Criminal Conspirator' (1910); 'Alleged Socialism of the Church Fathers' (1913); with Morris Hillquit, 'Socialism—Promise or Menace' (1914); 'Distributive Justice' (1916); and numerous pamphlets on social questions.

RYAN, Patrick John, American Roman Catholic prelate: b. Cloneyharp, Ireland, 20 Feb. 1831; d. Philadelphia, Pa., 11 Feb. 1911. He studied at the Christian Brothers' school in Thurles and began his classical course at Mr. Naughton's school, parish of Rathmines. Determined to become a missionary in the United States, he entered Carlow College and after receiving sub-deaconship there, came to the diocese of Saint Louis, Mo. He was ordained to the priesthood in 1853, made rector of the cathedral and subsequently appointed pastor of the Church of Saint John the Evangelist and vicar-general of the Saint Louis diocese. In 1868 Father Ryan accompanied Archbishop Kenrick to Rome and while there preached a series of Lenten sermons that elicited great praise. On 14 April 1872, he was consecrated Titular Bishop of Tricomia and coadjutor to Archbishop Kenrick and on 11 Jan. 1894 was elevated to the titular archbishopric of Salamis, being transferred the same year to the archiepiscopal see of Philadelphia. In 1883 he was among the United States prelates chosen to visit Rome in the interest of the Catholic Church in America. He gave two annual inaugural addresses at the State University of Missouri, lectured twice before the representatives of the Missouri legislature and delivered discourses in nearly all the large cities of the United States, notable among these lectures being that on Modern Skepticism. He published 'What Catholics Do Not Believe,' and 'The Causes of Modern Religious

THE LATE MOST REVEREND PATRICK JOHN RYAN

Skepticism.' In 1902 President Roosevelt appointed Archbishop Ryan a member of the Indian Commission and he was a member of the Executive Board of Catholic Indian Missions. The archdiocese of Philadelphia, over which he so ably presided, has a Catholic population of about 475,000; more than 500 priests; 240 churches; 117 parochial schools; 5 hospitals and 12 orphanages, besides many benevolent and educational institutions.

RYAN, Thomas Fortune, American capitalist: b. Nelson County, Va., 17 Oct. 1851. He engaged in the drygoods business at Baltimore in 1868, but in 1870 went to New York and entered Wall street, becoming a member of the stock exchange in 1874, when but 23 years old. He was connected with the consolidation of the street railways and lighting systems of New York, Chicago and other cities; was interested in railroad and coal properties in Ohio and West Virginia; and in 1905 he purchased a controlling interest in the Equitable Life Assurance Society of the United States. Upon his retirement in 1908 he was officer or director in more than 30 corporations. He was a supporter of the Democratic party, a liberal contributor to campaign funds, and served as a delegate to National Democratic conventions.

RYAZAN, rē-ā-zān'. See **RIAZAN**.

RYBINSK, rū'bēnsk, or **RUBINSK**, Russia, in the government of Yaroslav, 52 miles northwest of Yaroslav, on the Volga, at the confluence of the Rybinsk. As the port of Petrograd, it is one of the most important points of north central Russia. It became a centre of traffic when the three canal systems connecting Petrograd with the Volga were opened. Its enormous business of transshipment and active trade in grain and hemp, during the season, increases the population by nearly 100,000 workers. Permanent pop. about 30,000.

RYDAL, England, a picturesque village in the county of Westmoreland, two miles northwest of Ambleside. It is situated in a narrow gorge formed by the projection of two mountains near Rydal Lake. The lake, only half a mile in area, contains two beautiful islets, is encircled by meadows and dominated by rocky heights which add to the charm and calm beauty of the surroundings, so celebrated in English literature. Rydal Hall is a fine mansion in a park which contains many grand forest trees and a cascade immortalized in verse by Wordsworth, who lived for some years at Town End, near by, the residence also for a time of De Quincey.

RYDBERG, rüd'bērg, **Abraham Viktor**, Swedish writer: b. Jönköping, 18 Dec. 1828; d. Stockholm, 21 Sept. 1895. He studied at the University of Lund, and in 1855 entered journalism, contributing to the leading paper of Gothenburg. In 1868 he was sent to an assembly of the church where he was the champion of liberal ideas and from 1870 to 1872 sat in the Riksdag. In 1884 he became professor of the history of civilization at Stockholm. He is the author of 'The Pirate of the Baltic' (1857); 'The Last of the Athenians' (1859), which has been translated into English, German and Danish; 'The Doctrine of Christ According to the

Bible' (1862); 'Magic of the Middle Ages' (1864); 'Romish Legends of the Apostles Peter and Paul' (1871), etc. His works include studies in æsthetics, philosophy and psychology, besides poetry and a translation of Goethe's 'Faust,' and he is regarded as one of the foremost Swedish men of letters.

RYDE, rid, England, a watering-place in the Isle of Wight, on the Spithead shore, seven miles east-northeast of Newport. It is regularly laid out on a sloping site, and is a picturesque, elegant and well patronized summer-resort, having regular and frequent steamboat communication with Portsmouth, Portsea, Southsea, etc. Pop. about 13,000.

RYDELIUS, Andrew, Swedish prelate and scholar: b. Linköping, in 1671; d. 1738. He studied under John Bilberg, and became instructor of philosophy and theology at Lund, where later he was appointed bishop. In 1718 he published a 'Course of Philosophy'; his other works include 'Grammatista Philosophans'; 'Sententiæ Philosophiæ Fundamentales'; 'Orationes Academicæ.'

RYDER, Albert Pinkham, American artist: b. New Bedford, Mass., 19 March 1847. He studied his profession under William E. Marshall and in the art schools of the National Academy of New York. He has made a specialty of pastoral landscape and has been styled "the last of the Romancists."

RYDER, William Henry, American Universalist clergyman: b. Provincetown, Mass., 13 July 1822; d. Chicago, Ill., 8 March 1888. He engaged in preaching when but 19 and at 21 became pastor of the First Universalist Society in Concord, N. H. He afterward preached at Nashua for two years and then traveled in the Holy Land. In 1850 he accepted the pastorate of the Universalist Church at Roxbury, Mass., from which he resigned in 1860 to become pastor of Saint Paul's Church, Chicago. At his death he bequeathed more than half a million dollars to various charitable, educational and religious organizations without regard to any difference in creed.

RYDQVIST, John Erik, Swedish author and critic: b. Gothenburg, 20 Oct. 1800; d. 19 Dec. 1877. He abandoned trade in 1820 to study law and ancient languages, and in 1827 received a civil appointment in the central administration. He became known by his literary and critical works, joined the staff of the Royal Library at Stockholm, and in 1843 was appointed chief librarian. The same year he succeeded Berzelius as member of the Swedish Academy. Besides numerous translations of Greek and English works into Swedish, literary and critical essays published in various collections, notably in the 'Heimdal,' a critical review that he conducted from 1828 to 1832, his principal works include 'The Chief Literary Events of Past Ages' (1828); 'The Most Ancient Stage Works of the North' (1836); 'The Civil Service in Sweden' (1838); 'J. Olof Wallin' (1839), a biographical study; 'Travels in Germany, France and Italy' (1838); and 'The Laws of the Swedish Language' (2 vols., 1850-57), a philological work of great value.

RYE, N. Y., a town of Westchester County, on the New York, New Haven and Hartford Railroad, eight miles northeast of New Ro-

chelle. Rye was founded in 1660, and five years later was organized as a town of Connecticut, the border line not being settled until 1700. One of Rye's interesting features is the Jay homestead, where John Jay spent his youth. Port Chester, a manufacturing village, is within the boundaries of Rye, and Rye Beach on Long Island Sound, with its picturesque colony of bungalows, cottages and shacks, is a favorite summer resort for bathing, boating and other recreations. Pop. 5,242.

RYE (*Secale cereale*), a plant of the grass family, and allied to wheat, which yields the fifth most important cereal crop in the United States. It is an erect hardy annual, with slender stiff culms from four to six feet high, flat leaves, and a terminal, compact, somewhat flattened, bearded spike from four to six inches long. The spikelets are usually two-flowered, sessile, compressed, alternate, convex on one side and flat on that next the rachis. The outer glume is keeled and often carries a short awn, while the flowering glume carries a long awn. Each floret has three stamens and two very short styles. The grain is oblong, furrowed on the inside, hairy at the apex and generally free from the flowering glume and palea. The plant is not found wild, but is believed to be indigenous to the country bordering the Black and the Caspian seas. The granules of rye-starch are larger than those of wheat or barley, some being .0016 of an inch in diameter. The form of the larger ones is that of a flattened disc with a depressed centre having cracks on its outer edge. The hilum is central with lines radiating almost to the circumference.

Rye is hardier than wheat and is usually cultivated in cool regions on sandy or light soils, and in the Eastern States on medium loams which have become physically or chemically defective and will not produce satisfactory wheat crops. It will thrive on reclaimed peaty soils. In rotation, rye occupies the same place that wheat would, and, like the latter, prefers a fine firm seed bed. For a grain crop, from one and one-quarter to two bushels per acre are usually sown in the autumn. Judicious rolling and harrowing in spring is often beneficial. The crop is harvested just before it is fully ripe, a good yield varying between 15 and 30 bushels of grain and from one to two tons of straw. The straw is particularly tough and pithy and of little feeding value. It takes a long time to rot in the manure heap when used as litter, unless it is chaffed.

Two types of rye are grown, the common or autumn-sown usually grown for grain, and the spring-sown usually sown in spring, but the former may be sown in spring and the latter in autumn. Midsummer or Saint John's Day rye and giant or Tyrolese rye are spring varieties and good for forage, the latter requiring a rich soil. When grown for forage, as a cover crop, or to be plowed in as green manure, three bushels of rye may be sown per acre at various seasons of the year, the only proviso being that there shall be sufficient moisture and warmth present to insure germination and growth. Green rye is an excellent feed, either for soiling or folding in the spring, being well suited for cows in milk or ewes with lambs. As soon as the ear appears the straw becomes tough and woody, so that stock refuse it, hence it should be grown in small areas and a suc-

cession put in. A bushel weighs about 56 pounds and each pound contains on an average about 21,000 kernels.

Feeding Value and Uses.—In northern Europe the grain is largely used for bread-making, but in this country it is chiefly employed either in the manufacture of malt and spirituous liquors, as rye whisky, etc., or as food for stock. Holland's gin and the national Russian drink, kvass, are largely made from rye. The following table shows that rye does not differ materially from wheat in composition, nor are its by-products chemically dissimilar from those of the wheat grain:

Average percentage composition of	Water	Ash	Protein	Crude fibre	Nitrogen-free extract	Ether extract
Rye.....	11.6	1.9	10.6	1.7	72.5	1.7
Rye flour...	13.1	0.7	6.7	0.4	78.3	0.8
Rye bran...	11.6	3.6	14.7	3.5	63.8	2.8
Rye shorts..	9.3	5.9	18.0	5.1	59.9	2.8

The percentage digestibility of rye meal with ruminants is: dry matter 87, protein 84, nitrogen-free extract 92, ether extract 64; while that of rye bran with pigs is: dry matter 67, protein 66, nitrogen-free extract 75, ether extract 58.

In milling the outer portion of the rye kernel constitutes the bran, the second layer the "middlings" or "shorts," and the inner portion the flour. For stock the whole kernel is ground. Rye flour is somewhat similar to corn meal as a source of protein and energy, but is more expensive. Ground rye and rye bran are fed to cows in Denmark. Not more than three pounds daily should be given, as they are said to have a deleterious effect upon the quality of the butter. Experiments show that for pig feeding rye is of equal value with barley, and that one pound of rye is equal to six pounds of separated milk or 12 pounds of whey; that rye shorts are inferior to rye, the pork from the former being softer and showing more shrinkage. Ground rye may be safely fed to work horses to the extent of eight or 10 pounds daily, together with other feeds, as bran or oats. Owing to the hollow stems of rye holding considerable air, this crop is not making much progress for silage purposes.

Rye straw is longer and more uniform in size than that of other grains and when unbroken it is used for packing pottery, horse collars, mattresses, etc., and in the manufacture of a variety of articles, as paper, hats, bonnets, mats, slippers, toys and fancy articles. For such purposes it often commands a good price.

Diseases.—Ergot (*Claviceps purpurea*) is the chief disease and is common on other gramineæ. The elongated, curved, brownish or purplish spurs of ergot form on the head in place of a kernel and are sown with the seed unless it is carefully screened. If sown, they germinate and finally send out minute spores which, attaching themselves to the grass, live on it parasitically, send out small thread-like growths which finally reach the ovary, where they displace the rye grain and reproduce the cockscur or resting spore. Ergot should be

removed before rye is used as feed; it is dangerous to man and beast.

Statistics.—In 1910 the world's crop of rye was 1,675,898,000 bushels and the production of the United States, 33,039,000 bushels, both being almost the high record. In 1914, the last year in which complete world statistics are available, the production was 1,596,882,000 bushels. In 1914 the leading countries growing rye were Russia, (est.) 800,000,000 bushels; Germany, 410,478,000 bushels; Austro-Hungary, 116,965,000 bushels. The average yield per acre for the first 15 years of the century are Germany 25.6 bushels; Austro-Hungary 18.3 bushels; United States 15.7 bushels; Russia 11.5 bushels. The United States production has been much increased. The Food Administrator's estimate of the crops of 1917 was 56,100,000 bushels, and that 20,000,000 bushels were available for export. The Canadian production is nearly as great. The 1917 rye harvest of the European Allies was estimated as 41,732,000 bushels. Wisconsin, Minnesota, Michigan, Pennsylvania and New York are the largest producers in America.

SAMUEL FRASER,
Instructor in Agronomy, Cornell University.

RYE-GRASS. See GRASSES OF THE UNITED STATES.

RYE-HOUSE PLOT, in English history a conspiracy which took place in the reign of Charles II, and which became famous from the fact that its detection involved the death of Lord William Russell, Lord Essex and Algernon Sidney, who were in no way connected with it. The immediate object of the Rye-house Plot, which was contrived in 1683 among a number of obscure persons belonging to the party of which those celebrated men were among the leaders, was to assassinate the king and his brother, the Duke of York (afterward James II), as they returned from the Newmarket races. This plan was to have been executed at a convenient spot on the road from Newmarket to London, where there was a farm called Rye-house, belonging to one of the conspirators named Rumboldt; but the plan was frustrated by the king and his brother returning from Newmarket earlier than was expected. Soon after information of the matter was laid before one of the secretaries of state, and it was added that since this plot had been frustrated the plan for a general insurrection had been taken up by various eminent persons, among whom were those mentioned. A general insurrection had indeed been talked of, and the details and probable success of such a scheme appear to have been considered by the accused persons; but there was no evidence to show that the promoters of the wider scheme were involved in the minor plot, which was engineered, after the general insurrection had first been talked of, by a few of those already concerned in the larger plan. Yet from the way in which the revelations were made to the government the two schemes were completely confounded, and Russell, Essex and Sidney were arrested on the charge of treason. Essex put an end to his own life in the Tower, and Russell and Sidney were condemned and beheaded. Lieutenant-Colonel Walcot, one of the real contrivers of the Rye-house Plot, was at the same time brought to the block.

RYERSON, rî'er-sôn, Adolphus Egerton, Canadian Methodist: b. Charlotteville, 24 March 1803; d. Toronto, 19 Feb. 1882. He entered the Methodist ministry in 1825; and became identified with the Methodist Episcopal Church of Canada at the organization of that body in 1828. In 1832 he went to England to form a connection with the parent body. In 1842 he became first president of Victoria College and in 1845 was appointed superintendent of education for the province of Upper Canada, a position he retained for 30 years. Besides founding and editing *The Christian Guardian*, he wrote 'A Manual of Agricultural Chemistry'; 'The Clergy Reserve Question'; 'Compulsory Education.' Consult Ryerson, Egerton, 'The Story of my Life' (1884).

RYEZHITZA, Russia, town in the government of Vitebsk, situated about 150 miles northwest of the town of Vitebsk and on the Petrograd-Warsaw Railroad. It was founded by the Teutonic Knights in 1285 with the object of holding in check the turbulent Lithuanians and their neighbors the Letts. It was the object of frequent attacks by these peoples. It was called Roziten in the Livonian chronicles and in 1561 was traded to Poland. The Russians took it in 1567 and a second time 10 years later. In 1656-60 it was captured by the Swedes and its fortifications razed. In 1773 it became part of the Russian Empire. It enjoyed increased prosperity in the 19th century and in the same period its population grew to about 12,000.

RYGH, rug, Oluf, Norwegian archaeologist: b. Stiklestad, 1833; d. 1899. He received his education at Trondhjem and at the University of Christiania, where he was for 40 years successively director of antiquities, professor of Scandinavian archaeology and professor of history. His great work, however, was in reducing to system the archaeology of Norway. His best-known works are 'Om den ældre Jernalder i Norge' (1869; Fr. translation, 1869); 'Om den yngre Jernalder i Norge' (1877); 'Norske Oldsager' (1880-85); 'Norske Gaardnavne' (15 vols., 1897 et seq.).

RYLAND, Henry, English artist: b. Biggleswade, Bedfordshire. He was trained in art at the South Kensington schools and worked at Paris in the studio of Benjamin Constant, and at Julien's Academy under Boulanger and Lefebvre. His practical professional life was begun by him as a designer of stained glass and he contributed to the *English Illustrated Magazine* in its early days. His first work as a painter was exhibited at the Grosvenor Gallery, but he has since exhibited, chiefly watercolors, at the other exhibitions of London, and many of his pictures have been engraved.

RYLAND, William Wynne, English engraver: b. London, July 1738; executed Tyburn, 29 Aug. 1783. He acquired his professional training from Ravenet and at Paris from Boucher and J. P. le Bas. He spent several years on the Continent and after his return to his native country executed portraits of Lord Bute, George III, Queen Charlotte and the Princess Royal with such success that he was given the official post of engraver to the king. He became a member of the Society of Artists in 1766 and was a frequent exhibitor. In his later years he abandoned line-engraving for the so-called "chalk-engraving" of stippled dots. In

the latter style he left copies of several old masters. He was a man of extravagant habits and after a series of troubles with his creditors was convicted of forgery, then a capital offense, and executed.

RYLANDS, John, English manufacturer: b. Saint Helens, Lancashire, 7 Feb. 1801; d. Stretford, 11 Dec. 1888. He received his education at the Saint Helens grammar school. In co-operation with his father and elder brothers, he founded at Wigan in 1819 the cotton and linen manufacturing firm of Rylands and Sons. As the business expanded, bleach-works and dye-works were added to their plant and a coal mine was discovered beneath the firm's property, which added greatly to their wealth. About 1826 several spinning mills were added at Bolton and other centres. In 1847 John became sole conductor of the business and in 1873 it became a limited liability company. The concern is now one of the largest in Great Britain. Rylands helped finance the Manchester Ship Canal and was active in philanthropy. The John Rylands Library at Manchester was erected as a permanent memorial by his widow in 1899.

RYLE, ril, John Charles, English Anglican bishop: b. Macclesfield, Cheshire, 10 May 1816; d. Lowestoft, Suffolk, 10 June 1900. He was educated at Oxford, took orders in the English Church, and was successively curate at Exbury, rector of Saint Thomas', Winchester (1843), of Helmingham, Suffolk (1844) and vicar of Stadbrooke, Suffolk (1861). He was appointed honorary canon of Norwich, in 1872, and in 1880 was nominated dean of Salisbury, but before he had taken possession of this post was made bishop of the newly formed see of Liverpool. He was one of the most prominent members of the Evangelical party, and besides publishing numberless tracts which were widely popular, was author of such books as 'Coming Events and Present Duties' (1867); 'Bishops and Clergy of Other Days' (1868); 'The Christian Leaders of the Last Century' (1869); 'Expository Thoughts on the Gospels' (1856-69).

RYLSK, Russia, town in the government of Kursk, 70 miles southwest of the town of Kursk, on a branch of the Kursk-Kiev Railway. Its industrial establishments comprise oil works, blast furnaces, soap and tallow factories, etc. There is a large trade in corn, hemp and agricultural implements. The town was founded in the 9th century and has a 15th century cathedral. Pop. 12,000.

RYMER, Thomas, English critic and antiquary: b. Yafforth, Yorkshire, 1641; d. London, 14 Dec. 1713. He studied at Cambridge, subsequently kept terms at Gray's Inn, and was called to the bar in 1673. In 1678 he published 'Edgar, a Tragedy.' In 1692 he succeeded Shadwell as historiographer royal, and was entrusted with the preparation of a collection of public treaties, which he began to publish in 1704, under the title of 'Fœdera, Conventiones, et cujuscunque Generis Acta publica, inter Reges Angliæ et alios Principes.' Of this valuable and learned work he completed 15 volumes, and five more were afterward added by Robert Sanderson. The publication of the whole work was completed in 1735.

RYMER, Thomas, of Ercildoune. See RHYMER, THOMAS THE.

RYOTWAR, rī'ōt-wār, in India, the lease of land by the government officers to the ryots or native cultivators at a fixed rent, a practice chiefly prevalent in the Madras Presidency.

RYSBRACK, rūs'brāk, **John Michael**, German sculptor: b. Antwerp, 1693 or 1694; d. 8 Jan. 1770. He went to England in 1720 and made a reputation by the exercise of his art, of which Westminster Abbey and several cathedral churches contain examples, among which may be mentioned the monuments of Sir Isaac Newton and the Duke of Marlborough. He also produced the equestrian statue of William III, at Bristol and the statue of Locke at Oxford.

RYSWICK, rīz'wīk (**RIJSWIJK**), Netherlands, a village between Delft and The Hague, famous for the celebrated treaty concluded there in September 1697, and known as the 'Peace of Ryswick,' signed between France, England, Spain, Holland and the Empire. It terminated a bloody nine years' war of the Grand Alliance against France. Louis XIV relinquished his recent conquests except Strassburg, which was taken in 1661; he abandoned Lorraine and Luxemburg, acknowledged the independence of Holland, repudiated the Stuarts and recognized the Protestant succession in England (William III).

RYSWICK, Peace of. See RYSWICK.

RZHEV, rzhěf, Russia, in the Tver government, occupies the heights on both banks of the Volga. It is a railway terminus, about 90 miles southwest of Tver and the centre of a great transit trade between the provinces of the lower Volga and the ports of Petrograd and Riga.

S

S the nineteenth letter and fifteenth consonant of the English and several other alphabets, is classed as a sibilant or hissing letter. The sibilant is produced by emission of the breath while the end of the tongue is brought close to the front palate just behind the gums; this is the hard open sound; the corresponding soft open sound is represented in the alphabet by *s*, but in practice is often represented by *s*. The form *S* is the Semitic *shin*, and the ancient Greek character *ς* (sigma) with its angles rounded; in the existing Greek alphabet the *s* is represented by *Σ*. In some English words *s* is silent: *island*, *aisle*. The final *th* of verbs has changed to *s* because of the nearness of sound of *s* to *th*: *loveth*, *loves*; *hath*, *has*. There are several words in English — and the like can be said of Greek — which, beginning with *m* or *p* or *l*, take on an initial *s*: *melt*, *smelt*; *pike*, *spike*; *lick*, *slick*; Gr. *mikros*, *smikros*. Compare Ger. *niesen*; Eng. *sneeze*. The palatalization which is so characteristic of English and the romance languages has had the effect of generally giving to *c* or *sc* before *e*, *i* or *y* the sound of *s*. Sometimes the sound of *s* is changed to that of *st*; the verb *hoise* becomes *hoist*, *whiles* becomes *whilst*; and there is the mispronunciation of *once*, *onst*; and the plural of *mouse* is *mice*. The digraph *sh* stands usually for the ancient *sc* (*sk*): Old Eng. *sceal*, *shall*, *fisc*, *fish*. It is pronounced with the edges of the tongue appressed to the teeth, but with the centre free; *s* alone represents this sound in *sure*, *sugar*, *issue*, etc. This sound is a surd; *s* represents its sonant in *osier*, *measure*, etc.; *sh* is replaced by *ch* in *machine*; *ci* in *social*; *sci* in *conscience*; *ti* in *martial*, all of which words are of Latin or French extraction. *S* stands for *south*, *second*, *sulphur*, *shilling*, and in combinations for science or society. *SS* stands for steamship. See ALPHABET.

S. P. Q. R., the initial letters of *Senatus Populusque Romanus* (the Senate and the Roman people), which expressed the political character of the Latin nation. These initials were carried as a battle standard by the Roman armies.

SS., commonly used at the head of affidavits and other legal documents, follows the brace which includes the state and county names where the paper is witnessed or the action at law laid. On legal documents *SS.* or *ss.* (*scilicet*), it is said, signifies "to wit," "namely."

"**SS**" is also "a symbol of unknown antiquity worn on the collars of the superior judges and lord mayors of England; formerly by persons attached to the royal household and others. It was assumed by certain classes, never bestowed

and had no connection with heraldry." — Storemouth.

From being an ornament of royalty, supposed originally to signify "sovereignty," it became the badge of followers of the house of Lancaster and passed unofficially to persons in authority, like magistrates, mayors and justices; and from being used upon the collar came to be used on official writings to indicate the authority of the magistrate, mayor or judge who gave the same.

The mysterious "**ss**" is then, we may conclude, a symbol of official position. Whatever the origin of the symbol, the "**esses**" is an ornament, passed into a sign of judicial or magisterial authority, and as such follows the name of the State or county where a document is witnessed or an action at law is laid.

SÁ DE MIRANDA, Francisco de, frān-thēs'kō dā sã dã mē-rān'dã, Portuguese poet: b. Coimbra, Portugal, 27 Oct. 1485; d. there, 15 March 1558. He wrote much in Spanish, taking for his models Dante and Petrarch, but in sentiment remained entirely loyal to his native country. His fame rests chiefly upon his poetical epistles and eclogues, though his entire work is excellent and characterized by sincerity and love of natural beauty. He is ranked as one of the six greatest Portuguese poets. An edition of his work edited by Caroline Michaëlis de Vasconcellos contains 189 of his pieces, 74 of which are in Castilian.

SAADJA GAON, sã-äd'yã gã-ôn' (SAADJA BEN JOSEPH, Arab SAID), Jewish Rabbī: b. Fayum, the Biblical Pithom, Egypt, 892; d. Babylonia 941. In 828 he was appointed Gaon or principal of the Jewish Academy at Sura, near Babylon, into which dwindling institution his zeal and learning infused new life. His acquirements were many and varied, living in a time when philosophy and reason were in danger of usurping the authority hitherto wielded by tradition, to which end the Karaites particularly contributed. It was the work of Saadja to discover a common ground for the maintenance of Jewish dogma side by side with philosophical theory. This was the object of his great work, written in Arabic, 'Emunot w'deot' ('Faith and Ethics') which was translated into Hebrew by Juda ibn Tibbon (1160) and into German by Fürst (1845). Saadja wrote a commentary on some of the books of the Old Testament, treatises on grammar and hymns for the synagogue. On the 1000th anniversary of his birth a complete edition of his works was published by Joseph Derenbourg. Consult Grätz, 'Geschichte der Juden' (1870); Guttman, 'Die Religionsphilosophie des Saadja' (1882).

SAALE, zä'lě, Germany, the name of several rivers, flowing between Baireuth and Hof, in the northeast of Bavaria. The most important of these is the river rising in the north side of the Fichtelgebirge at an altitude of 2,390 feet. It is navigable from Naumberg and passes Kahla, Jena, Kainburg—it becomes very circuitous passing Merseburg and Halle, and finally connects with the Elbe, near Leipzig, by canal. It flows through a fertile and picturesque valley for 200 miles, its romantic heights crowned by many castles. It is of great commercial value, having a wide and deep channel in the greater part of its length.

SAARBRÜCKEN, zār'brük-ën, or **SANKT-JOHANN SAARBRÜCKEN**, Germany, in the Rhine province, Prussia, is situated on the Saar, 39 miles southeast of Treves. Its sister-town across the river gives the town the double name. It is an important industrial centre, is well built, and has a castle. There is a celebrated mining academy and a monument to Bismarck. The principal industries are wool-spinning, brewing and the manufacture of tobacco, chemicals, tin and stoneware. Trade is mainly dependent on the coal mines, the glass and iron works of the district. In 1870 the French and Prussian forces fought here the first engagement of the Franco-German War resulting in a partial victory for the French, which the Germans retrieved four days later by their first victory at Spicheren in the vicinity. Pop., including Sankt-Johann about 106,000.

SAB, or **ESPATOLINO**. 'Espatolino' of Gertrudis Gómez de Avellaneda, a Cuban who lived the greater part of her life in Spain, was written in 1844. Espatolino is a famous Italian bandit who wreaks vengeance on society by means of robbery and murder and who is captured only through treachery. The novel was at one time very popular during the vogue of Scott, Dumas, Hugo, and Georges Sand, all of whom influenced Señora Avellaneda. Espatolino is characteristic of her work which is passionate and lyrical. She was a gifted poet and rises to eloquent heights in Espatolino's tirades against the established order of things social. Her work, however, has waned in popularity since the passage of time has ameliorated conditions in prison life and methods of punishment of criminals. Espatolino is a combination of Jean Valjean and Robin Hood. He is not a vulgar fugitive from justice; he has a noble, generous soul and in true Romanticist fashion strikes back hard at his pursuers. Annunziata is a passionately devoted wife who consecrates her life to the uplift of her husband, but who fails through the treacherous machinery of man-made justice and is driven insane. 'Espatolino' may be found in the fourth volume of the author's *Obras Literarias*, Rivadeneyra, Madrid 1870. For a full critical estimate of 'Espatolino,' consult 'Biografía de G. G. de Avellaneda' by Aurelia Castillo de González.

SAMUEL M. WAXMAN.

SABA, sā'ba, one of the Leeward Islands, Dutch West Indies, area five square miles. It is high and rocky, rising abruptly from the sea to a height of nearly 3,000 feet. A small part is under cultivation; the chief products are tropical fruits and vegetables, especially cab-

bages and cotton. Fishing is also an important industry, and fishing boats are built on the island. The inhabitants are the descendants of Dutch and Scandinavian pirates who occupied the island in the 17th century. The island nominally belongs to Holland, but the people are practically independent, being exempt from taxes and electing their own governor. Pop. about 3,000.

SABADILLA, or **CEVADILLA**, the pharmaceutical term for seeds of a liliaceous plant (*Schænocaulon officinale*), growing in Central America, with a bulbous root, grass-like leaves and a flower-stalk some six feet in height. The papery, tri-capsular fruits contain a few pointed, wrinkled, blackish seeds, persistently acrid and sternutatory, a powerful irritant and poisonous. They are employed for preparing veratrine, which, in the form of a tincture or ointment, is used as an external application for neuralgia and rheumatism, but is likely to prove poisonous if the skin be broken, thus permitting absorption. Sabadilla has also been given as a vermifuge but is dangerous, and is used for killing vermin.

SABÆANISM, sā-bē'an-izm, or **SABIANISM**, a religion whose believers were once numerous in Arabia, Syria and Mesopotamia, which while it recognized only one supreme being, also worshipped, or paid high reverence to angels, or inferior divinities, supposed to reside in the stars. This part of the Sabæan creed virtually amounted in practice to star-worship.

SABÆANS, an ancient people of Arabia, information of whom we have nothing except the mention made of them in the Bible and other contemporary literature to which must be added archaeological remains of various kinds including coins, carvings, inscriptions and buildings, generally in a very ruined condition. The Sabæan clans seem to have been quite extensive and to have been of considerable importance and influence in their day. They extended from southern into northern Arabia. The Queen of Sheba, who visited Solomon, is said to have belonged to the Sabæans; and the traditions which long told of her wealth and power, whether based on legend or history, or both, are but a reflection of the popular estimation of her people. Much speculation has been indulged in as to the real meaning of the visit of the Queen of Sheba to the Courts of Solomon; and some critics have seen in the event a political alliance of two important peoples against their common enemy the Minæans. All the Biblical references to the Sabæans convey ideas and pictures of their greatness and their commercial activity. There are indications that already in the 8th century B.C., the Sabæans had assumed active commercial and other relations with Assyria and had taken possession of territory in northern Arabia. From inscriptions and other archaeological remains the names of 15 Sabæan priest-kings ruling between 750 and 525 B.C., have been recovered; and from this later date there are more or less accurate lists of other rulers. The Sabæans in southern Arabia seem to have been known, at a comparatively early date, by both Greeks and Romans as the people of Yemen. In 24 B.C., when the breath of Roman domination was in the air, an armed expedition under

Ælius Gallus was sent to subdue the southern Sabæans. But here the Romans met with defeat. That the Sabæans were well known to the Latin world and that there was considerable interest in them in Rome, there is evidence in the fact that Pliny describes them at some length. Powerful though they once were the Sabæans finally became subject to the Himyarites, who seem to have retained dominion over them until 525 A.D., when they were subdued by the Aksumites, who were finally expelled from the country in 570. But the independence of the Sabæans did not long continue for it was soon swept away by the wave of Mohammedan conquest. No doubt further excavations and unearthed records will rather increase than diminish the importance of the Sabæans in the history of civilization in western Asia during from 800 to 1,000 years immediately preceding the Christian era. That they carried on extensive commerce with all the surrounding nations and extended their trade relations into Egypt and India there is plenty of evidence. A vast amount of material relative to Sabæan customs, life and history has been collected. This includes over 1,000 inscriptions made by Glaser alone. But the work of translation and publication has lagged far behind that of excavation. Therefore much new light may be expected to be shed soon on the history, customs and mythology of the ancient Sabæans.

"Sabæans" is also the name given to a modern eastern sect, the "Christians of Saint John," because they deny the Messiahship of Jesus and exalt John the Baptist.

The ancient star-worshippers of Western Asia were also called Sabæans (from *tseba*, the host, that is of heaven, like stars).

The name was also applied to the descendants of Saba (Seba) who, tradition says, settled in Ethiopia.

To the Jews, the Sabæans, even in the time of Christ, were "a people afar off" or of "the southland," who were rich in frankincense and aromatic myrrh, a people coming "from the earth's extremes." Consult Glaser, E., 'Skizze der Geschichte und Geographie Arabiens' (Munich 1899); 'Die Abessinier in Arabien und Afrika' (Munich 1895); Nielsen, D., 'Neue Katabanische Inschriften' (1906).

SABAISM, an ancient natural religion that extended through the countries of the Assyrian and Medo-Persian empires as far as Asia Minor, between the Caspian Sea, the Euxine and the Mediterranean, from the Armenian Mountains as far as the banks of the Nile and southern Arabia. It assumed different forms in different countries, being sometimes more sensual, sometimes more spiritual. The objects of worship were the sun, the moon and the planets, or rather the planetary spirits of which the planets were believed to be the frame or the body. The worship of the sun (a female deity) was especially cultivated in Babylon and Phœnicia. The worshippers of the stars generally ascribed to them a great influence upon and a knowledge of terrestrial affairs; and astrology and the casting of nativities were, therefore, the natural result of Sabaism. The astrological system was most largely developed by the Egyptians, while Parseeism was the purest and most perfect form of Sabaism. In

the Koran the star worship of ancient Arabia is designated by the name Sabaism. In the town of Haran, in Mesopotamia, a kind of Sabaism maintained itself, surrounded on all sides by Christianity, until the Middle Ages. One sect of Sabæans believed in the migration of the soul and in great world-periods, constantly renewed in an everlasting revolution. Oracles, sacrifices and massive temples were features of Sabaism. Incense was offered to the gods and used to purify the temples. The priesthood formed a powerful and well-organized body to whom tithes were paid in the name of the gods. There was generally a temple connected with each Sabæan fortress. The Sabæans, who were a people skilled in the mechanical arts, great traders and wealthy, made handsome gold and silver statues of their chief gods. Consult Glaser, E., 'Skizze der Geschichte und Geographie Arabiens' (Vienna 1889); 'Altjemenische Nachrichten' (Vol. I., 1906); Hommel, 'Aufsätze und Abhandlungen' (1892); Mordtmann, J. H., 'Musée Impérial Ottoman' (Constantinople 1895); Nielsen, D., 'Die Altarabische Mondreligion' (1904); 'Neue Katabanische Inschriften' (1906); 'Der Südarabische Gott Ilmekah' (1909); Weber, O., 'Gottes Symbole und Südarabischen Denkmäler' (in the 'Hilprecht-Buch,' 1909).

SABAL, or **CABBAGE PALMETTO**, the most northern arborescent palm in the world. It is a tree attaining 80 feet in height. Until it is from 10 to 20 feet high, its straight, robust stem is surrounded by the dry fibrous sheaths and the stubs of petioles of leaves project like spines and give a very picturesque and characteristic appearance. The leaves, massed at the top of the trunk are cordate, or fan-shaped, narrowly pinnatifid, each division cleft at its apex and recurved at the summit. The terminal bud, by which growth is continued, or "cabbage," is a favorite delicacy with the negroes, who cut it out of the young and healthy trees,—thereby causing the ultimate death of the palmetto—and cook it as a vegetable. Many palmettoes are killed by the removal of the tops of the young trees. These tops are sent to factories, where they are trimmed down to a disc some eight inches thick, the soft central parts are cut out and the disc is then boiled to loosen the fibres of the sheaths and petioles, which are made into scrubbing brushes. These buds for brushes are worth only about six or seven cents apiece and yet the trees are being exterminated for so slight returns. The mature leaves are used for thatching and the trunks resist teredos to such an extent that they are valuable for submarine pilings.

This palmetto has always been interwoven with the history of South Carolina, the "Palmetto State." A fortification, or stockade, on Sullivan's Island in Charleston Harbor, 1776, was composed of earth and palmetto logs and succeeded in repulsing the attacking British fleet under Sir Peter Parker, whose shot had practically no effect on the wall, for they could not split the spongy trunks, but were imbedded in them. Therefore, in memory of this event, the palmetto tree appeared on the seal of South Carolina, over an uprooted branchless oak-tree representing the oaken ships of England; on a flag adopted after the Ordinance of Secession

(1861) was passed; and also on a medal. At the signing of the secession ordinance, palmetto trees flanked the platform and at the back was the banner of the convention, bearing among other curious devices, a most unnatural palmetto, with a gigantic rattlesnake wound about its trunk. Cockades, rosettes of blue ribbon with a palmetto imprinted on a button in the centre, were worn by Charlestonians in 1860-61.

SABALO, a name of the tarpon (q.v.), further known as savalle, savanilla, grande ecaille, silver-king, etc.; also of the Hawaiian milk-fish (*Chanos chanos*).

SABAOTH, sāb'ā-ōth, or sa-bā'ōth, Lord God of, a term used in the Scripture, meaning "Lord God of Hosts." It has no connection with the word Sabbath.

SABATIER, sā-bā-tē-ā, Paul, French theologian and historian: b. Saint-Michel-de-Chabrillanoux, Ardèche, 3 Aug. 1858. He was educated in the theological faculty of Paris, and in 1885 became vicar of the French parish of Saint Nicholas at Strassburg. The German government offered him a superior appointment, involving his becoming a German citizen; he requested to be allowed to retain his post as vicar, but the request was viewed as a political manifestation, and he was banished from the country. For a brief time he was pastor of Saint-Cierge-la-Serre; then he withdrew from the ministry to devote himself wholly to historical studies. His chief work is 'La Vie de Saint François d'Assise' (1893), based largely on previously unutilized documents discovered by him in various Italian archives. Within a year from the appearance of the first French edition, editions had appeared in almost all Continental languages, including Swedish and Polish. The Russian version was prepared under the direction of Tolstoi. Sabatier published also 'La Didaché ou l'enseignement des douze Apôtres' (1885), and editions of the 'Speculum Perfectionis' by Leo of Assisi (1898; translated into English by S. Evans as 'Saint Francis of Assisi, the Mirror of Perfection' (1898), and of the 'Tractatus de Indulgentia' (1900), of Franciscus Bartholus. He also has published 'Modernism' (1908); 'L'orientation religieuse de la France actuelle' (1911). Consult article by Rawnsley in *Contemporary Review*, Vol. 74, pp. 505-518 (1898).

SABAZIUS, sa-bā'zhī-ūs, a Phrygian divinity, identified by the Greeks in part with Zeus and in part with Dionysus. His symbol was a serpent. His worship extended to Greece, and was found also in Italy, especially in late pagan times. In 'De Corona' Demosthenes describes various ceremonies connected with the mysteries of this deity, and he was said to have been the first to employ oxen for plowing.

SABBATAI ZEVI, sāb-bā-tī' zē-vē', whose name is also spelled "Sabtai Zefi" and Sabathais Zevi, a pretended Messiah: b. Smyrna, 1626; d. 1676. He was a man of great learning and magnetic presence, and he led thousands of followers, mainly in Smyrna, Salonica, Alexandria and Jerusalem, to believe in him as the Messiah. In 1664 he had about 80,000 followers. In the following year the beginning of the Messianic reign within a few months and the rebuilding of the Temple in the next year were proclaimed in the streets of Alexandria by Sab-

batai and six disciples, clad in white raiments, with garlands on their heads. Having excited serious alarm at Constantinople, he was apprehended at Smyrna, and terrified into a recantation of his mission. He was said to have declared that his sole object had been to embrace Islam and to carry over all the Jews with him. The sultan declared himself satisfied and honored him with the title of an effendi, giving him an honorary post at the same time. He again aroused the jealousy of the Turks and was either poisoned in prison or publicly executed.

SABBATARIAN CONTROVERSY, the dispute in various forms between those who urge and those who oppose a rigid observance of Sunday. It has been going on from the time of King James I, of England, who favored Sunday sports, and hereby offended many of his subjects, and it has in late years included proposals to throw open to the public museums, libraries and galleries and other places of recreation and instruction, on the first day of the week. Most of these changes have been generally adopted.

SABBATARIANS, a term applied to those who urge rigid observance of Sunday. It was applied also in earlier times to the sect now known as Seventh Day Baptists, who observe Saturday for Sunday, and who, for that reason, are permitted in Rhode Island, where they are comparatively numerous, to work on Sunday.

SABBATH, the ancient Hebrews' weekly day of rest. In Hebrew the word means to cease, and the expression of Josephus (Apion ii, 2), who explains it as meaning "a rest from all labor," is rather to be looked upon as a commentary than as a derivation etymologically correct.

The Sabbath was the seventh day of the Hebrew week and lasted from sunset on Friday to sunset on Saturday. It was celebrated as a holy day; a day of rest and rejoicing; by ceasing from all labor, and by causing servants, strangers and cattle to cease also. Plants even were to rest; they were neither to be sown nor reaped on that day. The services of priests and Levites in and about the tabernacle and temple were, however, to be performed through the Sabbath-day. Circumcision, too, could take place on the Sabbath, when it fell on the eighth day after the birth of a male child.

Profanation of the Sabbath was punished by stoning to death. It was not until after the exile that the character of the work by which the Sabbath could be profaned was strictly defined. In the law only one act of labor was specifically prohibited, that of lighting a fire for the purpose of cooking. According to Josephus armies never proceeded on their march on the Sabbath. The Pharisees forbade even the plucking of grains of corn on that day; the healing of a sick man, or the walking of a cured patient bearing his bed. According to the Mishna even a broken bone was not to be set, nor dislocations poulticed or bound up on that day.

Origin of the Sabbath.—The Sabbath appears to have been an institution of religion long prior to Moses. It is sometimes said that it was borrowed by him from older nations, such as the Egyptians. Such Latin writers as

Seneca and Ovid give intimations that the veneration for the seventh day had found some favor among the early Romans. It seems more natural to suppose that it had come down with the old traditions of theocratic religion which are found embalmed in the first chapter of Genesis. The poem of the creation, in which God is related to have created the world in six days and rested on the seventh day, embodies a tradition much earlier than the period of Mosaic legislation. There are several intimations in the patriarchal age that the followers of Jehovah, such as Abraham and Isaac, chose certain times for rest, meditation, prayer and sacrifice to God. In after times it would almost seem as if the poem or hymn of the creation was used as a special part of Sabbath-day devotions. On that day the people were called to reflect upon the fact that the whole universe, including themselves, had an origin in one personal and supreme Being; that He had exerted His Omnipotence for a definite period and then had ceased from His work. They were constantly to remind themselves of the work of God, once for all completed, by their own six days' round of labor; and as God has rested from His work so were they to rest from theirs and to turn their thoughts toward Jehovah "who had done so great things for them."

Mosaic Ordinances of the Sabbath.—The scope and meaning of the Sabbath-day was very much extended and amplified by the provisions of the law as contained in the Hexateuch. It was made to be a day on which not only the finished task of creation was to be commemorated, but on which the great providential deliverances of the children of Israel were likewise to be recalled. But first of all the command is given by the law in various forms of speech, but with the same intent throughout the books of the law, Exodus, Deuteronomy and Leviticus, to remember the seventh day, the Sabbath, to keep it holy; most specifically in Lev. xxiii, 3: "Six days shall work be done: but the seventh day is the Sabbath of rest, an holy convocation; ye shall do no work therein: it is the Sabbath of the Lord in all your dwelling."

First of all there are three specifications as to the manner in which the week is to be spent: (1) by labor—"Six days shalt thou labor, and do all thy work:" (Ex. xx, 9); (2) by rest on the seventh day; on this day the people are ordered to rest, literally to take breath, then are enumerated in detail those who are enjoined from work: "Thou, nor thy son, nor thy daughter, thy manservant, nor thy maidservant, nor thy cattle, nor the stranger that is within thy gates." The penalty of death is threatened against all who shall disobey this command. The reasons of this command are given: (1) as a counsel of mercy—"Six days thou shalt do thy work, and on the seventh day thou shalt rest, that thine ox and thine ass may rest, and the son of thine handmaid, and the stranger, may be refreshed" (Ex. xxiii, 12); (2) as a commemoration of the deliverance from Egypt—"And remember thou wast a servant in the land of Egypt, and that the Lord thy God brought thee out thence through a mighty hand and by a stretched out arm, therefore the Lord thy God commanded thee to keep the Sabbath day" (Deut. v, 15); (3) as a commemoration of the finished creation "For in six days the

Lord made heaven and earth, the sea, and all that in them is, and rested the seventh day: wherefore the Lord blessed the Sabbath day, and hallowed it" (Ex. xx, 11); (4) as a sign of the covenant, just as circumcision was the sign of the Abrahamic covenant, and the rainbow the sign of the covenant with Noah—"Speak thou also unto the children of Israel saying: Verily my Sabbaths ye shall keep, for it is a sign between me and you throughout your generations, that ye may know that I am the Lord that doth sanctify you. . . . It is a sign between me and the children of Israel for ever: for in six days the Lord made heaven and earth, and on the seventh day He rested, and was refreshed" (Ex. xxxi, 13, 17).

The Jews of to-day who profess to keep up the tradition of their fathers still keep the Sabbath as a joyful festival. The Sabbath is held from Friday evening to Saturday evening. It is among some of them considered a pious observance to begin the celebration half an hour before Friday's sunset and to continue it half an hour after sunset on Saturday for the benefit of the souls of those who are in torment, for they believe that the damned are allowed a mitigation of their suffering during the feast. On Friday afternoon all the food for the following day is prepared, and their festal array is laid out for the Sabbath. Some Jews have special raiment which they wear only on that day; on the morning of which the Sabbath lamp is lit and the Sabbath bread laid on the table. The master of the house at the close of the evening meal blesses the wine and passes it around. They eat three meals on the Sabbath-day and they have a maxim that it is good to honor the day in the body, in dress, in eating and in drinking. Consult Abrahams, Israel, 'Jewish Life in the Middle Ages' (London 1896); Floody, R. J., 'Scientific Basis of Sabbath and Sunday' (2d ed., Boston 1906); Jastrow, Morris, 'Hebrew and Babylonian Traditions' (New York 1914); Lotz, Wilhelm, 'Quæstiones de historia Sabbati' (Leipzig 1883).

SABBATIA, a genus of *Gentianaceæ*, often growing in sand or salt marshes. These plants have verticillate leaves, handsome terminal flowers, with white or pink rotate corollas 5 to 12-merous; 4 to 12 stamens with thread-like filaments and two-cleft styles, capsules more or less globose, coriaceous and containing many small reticulated seeds. Several species have a tonic, although bitter, juice, and are used as febrifuges. Although named in honor of an early Italian botanist, Sabbati, the genus is said to be so called because the Pilgrim Fathers discovered the local *S. stellaris* on a Sabbath. This charming species, called the marsh pink, or Rose of Plymouth, bears a very delicate pink flower, with a star-shaped yellowish eye.

SABBATICAL YEAR, the seventh year which the law of Moses provided should be a year of rest for the land (Ex. xxiii, 10, 11; Lev. xxv, 1-7). The land was not to be sown and that which grew of its own accord was not to be reaped, but to be left for the poor to eat. Vineyards and oliveyards were also to be left uncultivated, and their produce ungathered; but the people were allowed to fish and hunt, and attend to their bees and flocks, and a triple produce was promised for every sixth year to

make up for the deficiency of the seventh. The sabbatical year was also to be a year of release for Jewish debtors (Deut. xv, 1-6), but those who were able to lend were strictly enjoined not to refuse loans to poor and needy persons because the year of release was at hand (Deut. xv, 7-11). In this year also the law was to be read solemnly to all the people assembled at the feast of Tabernacles (Deut. xxxi, 10). This institution seems to have been almost entirely ignored during the period which preceded the captivity, and in 2 Chron. xxxvi, 21, the time of the captivity is represented as one in which the land was enabled, by the will of God, to enjoy the sabbaths or years of rest that the Israelites had omitted to allow it. After the captivity Nehemiah sought to secure the better observance of the septennial sabbath, as he did that of the weekly sabbath (Neh. x, 31), and he seems to have had some success in the former as well as in the latter effort. The historic fact that Alexander the Great remitted the Jewish tribute in the seventh year because the Jews were debarred by their religion from employing the means of raising it, shows that it was observed a hundred years after the time of Nehemiah.

SABBATION, sab-bā'tē-ōn, or **SAMBAT-YON**, sam-bā'tē-ōn, Syria, a legendary river in Hebrew history, mentioned in the Midrash Gen. Rabba, lxxiii, in the Palestinian Talmud, by Josephus, as "the Sabbatic river," and by Pliny as "a river that ran for six days and rested on the seventh," whence its name, derived from the Hebrew *Shabbath* — Sabbath. It has been assumed to be the stream issuing from Fauwar ed-Deir, an intermittent spring in Lebanon. Mohammedans identify it with the Nahr-al-Arus in the neighborhood described by Josephus, which in modern times flows every third day. The river came into prominence in the 9th century owing to the story of the 'Children of Moses,' by Eldad the Danite, who describes the territory of the site of the exile of the Ten Tribes as surrounded by "this river of sand and stone which rolls during six working days and rests on the Sabbath day. As soon as the Sabbath begins, fire surrounds the river, and the flames remain until the next evening, when the Sabbath ends." The legend with variants has been repeated by different authors in succeeding centuries. See **LOST TEN TRIBES**, **THE**.

SABELLA, a genus of annelids dwelling on sandy shores in tubes formed solely of sand, the particles of which are glued together by means of a natural cement secreted by the worms, and thus form a smooth regular tube, presenting a striking contrast in its uniformity to the rougher dwelling-tubes of allied genera, such as *Terebella*. The worm itself possesses a slender body, the hinder part of which may be doubled up within the tube. The head is provided with slender tentacles.

SABELLIANISM, the theological views of Sabellius (q.v.), which, though they had numerous advocates, were condemned by the Church as heretical. See **MONARCHIANS**.

SABELLIUS, sa-bēl'i-ūs, Christian teacher: b. Pentapolis, Africa, or Italy. He taught at Ptolemais in Upper Egypt during the pontificate

of Zephyrinus (199-217) and Calixtus I (217-222), and is known as the founder of a sect who considered the Son and Holy Ghost only as different revelations or manifestations of the Godhead, but not as separate persons (see **MONARCHIANS**). The doctrines of Sabellius were opposed by Dionysius of Alexandria and Dionysius of Rome, by Epiphanius (who states that the Sabellians were very numerous around Rome and in Mesopotamia) and by Theodoret. Saint Augustine states that by the beginning of the 5th century they had entirely disappeared. Yet their views have always found adherents, and even now some theologians attempt to reconcile theology with reason by admitting conceptions of the Trinity coinciding with that of Sabellius. For his teaching Sabellius was excommunicated by Pope Calixtus.

SABIANS. See **SABÆANS**.

SABIN, sā'bīn, Alvah Horton, American chemist: b. Norfolk, N. Y., 9 April 1851. He was graduated at Bowdoin College in 1876 and was professor of chemistry at the University of Vermont in 1880-86, also serving as State chemist in 1882-86. In 1888-1905 he was engaged in the varnish business in New York, and since 1910 has been consulting chemist for the National Lead Company, New York. He has been lecturer at New York University since 1897. He invented the process for manufacturing sugar of milk in 1883. Since 1907 he has been sectional editor of the *Chemical Abstracts Journal* of the American Chemical Society. Author of 'Industrial and Artistic Technology of Paint and Varnish' (1904); 'German and American Varnish Making' (1911); 'Red Lead as Paint Material' (1917), etc.

SABIN, Edwin Legrand, American writer: b. Rockford, Ill., 23 Dec. 1870. He was graduated from the University of Iowa in 1892 and has published 'The Making of Iowa' (1900); 'The Magic Mashie' (1902); 'Beaufort Chums' (1905); 'When You Were a Boy' (1905); 'Bar B Boys' (1909); 'Range and Trail' (1910); 'Circle K' (1911); 'Old Four Toes' (1912); 'Pluck on the Long Trail' (1912); 'With Carson and Fremont' (1912); 'Treasure Mountain' (1913); 'On the Plains With Custer' (1913); 'Scarface Ranch' (1914); 'Kit Carson Days' (a biography, 1914); 'Buffalo Bill and the Overland Trail' (1914); 'Gold Seekers of '49' (1915); 'With Sam Houston in Texas' (1916); 'The Boy Settler' (1916); 'Opening the West with Lewis and Clark' (1917); 'The Great Pike's Peak Rush' (1917); 'How are You Feeling Now?' (1917); and contributions to magazines.

SABIN, Ellen Clara, American educator: b. Sun Prairie, Dane County, Wis., 29 Nov. 1850. Her father, Samuel Henry Sabin, served as first lieutenant in the 40th Wisconsin regiment in the Civil War. Miss Sabin studied at the University of Wisconsin in 1865-68, and in 1895 received from that institution the honorary degree of A.M. In 1912 Beloit College conferred on her the degree of Litt.D. and in 1915 she received the degree of LL.D. from Grinnell. Miss Sabin began her professional career in 1866 as teacher in the district school at Sun Prairie, Wis.; from 1869 to 1872 she was employed as teacher at Madison, Wis., where she became principal of the grammar school.

In 1873-85 she taught in Portland, Ore., spent the year 1885-86 in Europe, and in 1887-90 was superintendent of schools of Portland, Ore. In 1891 Miss Sabin became president of Downer College, Fox Lake, Wis., and since 1895 has been president of Milwaukee-Downer College. At the Columbian Exposition at Chicago in 1893 Miss Sabin was juror of the educational exhibit and from 1886 to 1892 was member of the National Council of Education.

SABIN, Joseph, American bibliophile: b. Braunston, Northamptonshire, England, 9 Dec. 1821; d. Brooklyn, N. Y., 5 June 1881. After apprenticeship to Charles Richards, bookseller of Oxford, he set up a bookshop of his own there, but in 1848 came to this country, where he conducted establishments for the sale of old and rare works in New York 1850-56, in Philadelphia 1856-60, and New York 1860-81. His bibliographical knowledge was wide, and he is said to have crossed the Atlantic not less than 25 times for the purchase of unique specimens. From 1869 he published for a number of years *The American Biblioplist*. He also prepared several compilations, among them 13 volumes of an uncompleted 'Dictionary of Books relating to America.'

SABINE, Sir Edward, English physicist: b. Dublin, Ireland, 14 Oct. 1788; d. Richmond, Surrey, 26 June 1883. He was educated at the military colleges of Marlow and Woolwich and in 1803 entered the army where he was commissioned 2d lieutenant of artillery. He served in the war with the United States in 1813-14 and accompanied Ross and Parry in their Arctic expedition in 1818 and that of Parry in 1819-20. While on these expeditions he engaged in researches in terrestrial magnetism and in 1821-25 conducted a series of voyages extending from the Arctic regions to the equator, gathering data concerning the magnetic needle, the figure of the earth and other points in meteorological and terrestrial physics. He was instrumental in the establishment of permanent magnetical and meteorological observatories, retaining directorship of those in the colonies for many years. In 1818 he was elected to the Royal Society, was its vice-president in 1850 and in 1861-71 acted as its president. He received rank as lieutenant-general in the army in 1859 and was retired with full rank as general in 1874. His works include 'An Account of the Experiments to determine the Figure of the Earth' (1825); 'The Variability of the Intensity of Magnetism upon Many Parts of the Globe' (1838), etc.

SABINE, Lorenzo, American historian: b. New Lisbon, N. H., 28 Feb. 1803; d. Boston, Mass., 14 April 1877. He sat in the New Hampshire legislature for three successive terms, but removed to Massachusetts in 1849, and was a Whig member of Congress in 1852-53. He is best known for his important work on 'The American Loyalists, or Biographical Sketches of Adherents to the British Crown in the War of the Revolution' (1847). He also published 'Life of Preble' (1847); 'Reports on the Principal Fisheries of the American Seas' (1853); 'Notes on Duels and Duelling, with a Preliminary Historical Essay' (1856), etc.

SABINE, Wallace Clement, American physicist: b. 13 June 1868. He was graduated

at Ohio University in 1886 and took his degree at Harvard in 1888. He has since been connected with the faculty at Harvard, was professor of physics there in 1905-14, and since 1914 Hollis professor of mathematics. He was agrégé professor at the University of Paris in 1916-17. Author of 'Architectural Acoustics' (1900).

SABINE, a river of the United States, which has its rise in the northeastern part of Texas, in Hunt County, flows southeast about 250 miles, then turns southward and forms the boundary between Texas and Louisiana, and enters the Gulf of Mexico through Sabine Lake and Sabine Pass. The mouth of the river is Sabine Pass, a narrow channel which is obstructed by a muddy bar. Considerable has been done to make this pass safe for navigation; jetty-building and dredging was begun as soon as the interior of Texas, near the Sabine River, was settled. Sabine Lake is an expansion of the river, but the Neches River also enters the lake. The Sabine River is about 500 miles long and is navigable in its lower course. See **BOUNDARIES OF THE UNITED STATES**.

SABINE, or SABINE PASS, Tex., town and port of Jefferson County, on Sabine Pass Harbor, between Sabine Lake and the Gulf of Mexico, 70 miles by water northeast of Galveston, on the Texas and New Orleans Railroad. The Pass has been improved by the Federal government at great expense, thus opening a water route for the regions reached by the Sabine and Neches rivers, exports from which include petroleum, lumber, grain, iron ore and sulphur. Extensive concrete wharves have been built by the oil and lumber companies, and the commerce of the port is increasing rapidly, being confined chiefly to exports. Exports, \$50,923,702. Pop. 8,600.

SABINE CROSS ROADS, Battle of, and BANKS' RETREAT TO ALEXANDRIA. Three miles southeast of Mansfield, De Soto Parish, La., one of the main roads from Alexandria to Shreveport is crossed by a road from Red River to Sabine River. At this crossing was fought a battle which marked the culmination and failure of what is known as the Red River Expedition. On 23 Jan. 1864, General Banks, then at New Orleans, received a despatch from General Halleck, dated the 4th proposing an expedition, to consist of the forces of Banks, Steele and such as could be spared by Sherman, for the capture of Shreveport, La., on Red River, and the recovery of Texas, thus opening access to the cotton of that section and stimulating trade. Banks had, on a previous occasion, for sound reasons, objected to such a campaign, but now acquiesced and promised a cordial co-operation; but he set forth the difficulties in the way, and made suggestions to remove them, not one of which was regarded. Engrossed with duties concerning political affairs in Louisiana, which had specially been confided to him by the President, Banks could not immediately leave New Orleans, and he entrusted the arrangements of the expedition to Gen. W. B. Franklin, his second in command, who was to move from the Teche 5 March, reach Alexandria on the 17th, and co-operate with a strong fleet under command of Admiral Porter. Porter arrived at the mouth of Red River on 7 March, with

a fleet of 15 ironclads and four light steamers, and there he was joined some days later by transports from Vicksburg, carrying four divisions of Sherman's army, under Gen. A. J. Smith, and the Marine brigade of Colonel Ellet. A part of the plan of campaign was that General Steele, with an army of 15,000 men, should move from Little Rock, Ark., directly on Shreveport; but Steele, after marching from Little Rock to Camden, was checked, fell back to Little Rock and took no further part in the campaign. (See JENKINS' FERRY, BATTLE OF). Smith's forces advanced, attacked and in conjunction with the navy, 14 March, captured Fort de Russv, up Red River, together with 283 prisoners, 10 guns, and many small arms, the Confederate covering force of 3,500 men, under General Walker, after burning two steamboats and a considerable quantity of cotton, retreating up the river. It was not until the 19th that Franklin, with very little opposition, which was brushed aside by his cavalry, reached Alexandria. Banks joined him on the 24th, but his entire column did not close up until the 26th. Meanwhile General Mower, with three brigades of Smith's division and a cavalry brigade of the 19th corps, marched from Alexandria on the 21st for Henderson's Hill, 25 miles westward, surprised the 2d Louisiana cavalry, and with slight loss captured 250 men, nearly as many horses, and four guns, with their caissons. Near Alexandria the fleet came to a series of rapids, and the water was so low that the ironclads could not run up them, but after a week's hard labor the lighter ones were carried over. The transports, which could not pass, returned to Vicksburg, and with them Ellet's 3,000 men. The withdrawal of the transports made it necessary to establish a base at Alexandria and to use a wagon-train to carry the supplies, while it was also necessary to leave a guard of nearly 4,000 men (under General Grover) to protect the place. General Franklin, with the main column, advanced on the road running west of and parallel to the river, to Natchitoches, about 80 miles above Alexandria, driving before him the Confederate cavalry, and reaching Natchitoches on 3 April, where he was joined by A. J. Smith's column, which, accompanied by Porter's fleet, had come to Grand Ecore, four miles from Natchitoches. Porter had a fleet of 13 gunboats and 30 transports.

Banks' army, on the eve of march from Natchitoches for Shreveport, was composed of two divisions of the 13th corps, under Gen. T. E. G. Ransom; five brigades of the 16th corps, under Gen. A. J. Smith; Gen. W. H. Emory's division, three brigades of the 19th corps; and Colonel Dickey's brigade of colored troops, under General Franklin; Gen. A. L. Lee's division of cavalry and mounted infantry, four brigades; and a small artillery reserve, under Captain Closson. These numbered 31 March 25,735 officers and men, with about 65 guns. Lee's cavalry force of 4,500 men had pushed out westward, 12 miles; on 2 April it ran across Confederate cavalry, drove it back eight miles, and then withdrew to wait for the general advance. This began on the morning of the 6th, led by Lee's cavalry, followed by the two small divisions of the 13th corps, under Ransom, and by Emory with a division of the 19th corps and Dickey's brigade

of colored troops. On the morning of the 7th A. J. Smith followed with Mower's division of the 16th corps. A division of the 17th corps, 1,730 strong, under Gen. T. Kilby Smith, remained with the transports, under instructions to conduct them to Loggy Bayou, opposite Springfield, about midway between Natchitoches and Shreveport, 110 miles by the river, above Grand Ecore, where he was to halt and communicate with the army at Sabine Cross Roads, 54 miles from Grand Ecore. Porter, Smith and the transports, with six gunboats carrying 17 guns, started on the 7th.

Lee's instructions from General Franklin were to attack the enemy wherever found, but not to bring on a general engagement. On the 7th he drove a brigade of General Green's beyond Pleasant Hill, and came upon a strong force under Green at Wilson's Farm. Lee attacked and after a hard engagement of two hours drove Green to Saint Patrice's Bayou, eight miles from Pleasant Hill. Here Lee bivouacked for the night, and sent back for infantry support. His loss had been 53 killed and wounded. Green's loss was greater, including about 100 prisoners. That night Franklin reached Pleasant Hill; A. J. Smith's division was still a day's march in rear of Franklin. At daybreak of the 8th Lee, having been reinforced by one of Landram's brigades of the 13th corps, dropped his wagon-train, and, moving forward, drove the Confederates from Saint Patrice's Bayou and gradually pushed them to a wood beyond a clearing at Sabine Cross Roads, and found himself in the immediate front of Gen. R. Taylor's army of 10,000 men. Taylor, whose forces had been much scattered, in Arkansas, Louisiana, and Texas, had concentrated them, and near Mansfield had the three divisions of Generals Green, Walker and Mouton — 10,000 men. On the morning of the 8th he moved three miles from Mansfield to Sabine Cross Roads and formed line in the edge of a wood, commanding, on both sides of the road, a clearing about 1,200 yards long, and 800 wide, through the middle of which was a deep ravine. He knew that Banks' column was stretched out on a single road for more than 20 miles, and was sanguine of success in attacking the head of it. Lee threw out a strong skirmish-line and waited for Banks' main body to come up. At noon Ransom arrived with a brigade, and line was formed. Banks rode up a little past noon, and sent back repeated orders for Franklin to hurry forward. After heavy and continuous skirmishing, lasting until 4.30 p.m., Taylor threw his entire force of 10,000 men heavily upon the Union line; Mouton's division and two brigades of dismounted cavalry made an impetuous charge upon the Union right, in which Mouton was killed at the first onset, while Walker's division and a brigade on its right fell upon the centre and left of the line. For nearly an hour the men (not over 4,500) of Banks' command resisted this attack, and then were compelled to fall back to the woods in rear of the open space at the cross roads, with heavy loss, including three guns. Franklin had come up with Cameron's division of the 13th corps, and a new line was formed, to be immediately broken by heavy attacks on both flanks and front. The Confederates were gaining the rear, and the Union line was pressed back along the

narrow forest road filled with wagons and mules of the supply-train, stragglers, and camp-followers, which so blocked the way that an orderly retreat was impossible. Soon a panic set in, the cavalry train of 156 wagons was captured, Ransom's 10 guns were taken, along with 1,000 of his men; Franklin and Ransom were wounded, some of the best officers were struck down; and in spite of the heroic efforts of Banks and others to rally them, nearly the whole army broke into a disorderly retreat, which was checked only at Pleasant Grove, three miles from the field of battle. Here General Emory, with his division, had come up at 6 P.M., and formed line in the edge of a wood, on a ridge overlooking a small stream; and scarcely had his line been formed when the panic-stricken fugitives came rushing back through it to the rear. The Confederates were close on their heels, made an immediate assault upon Emory, and were met with a severe fire delivered at close quarters that instantly checked them. After an hour and a half of fierce battle, in which they made desperate efforts to turn Emory's right, the Confederates were everywhere repulsed with great loss, but held the shores of the stream. Banks' army, after having advanced to within two marches of Shreveport, had been saved from total destruction "by a triumph of valor and discipline on the part of a single division and of skill on the part of its intrepid commander." The action is known as the battle of Pleasant Grove. The Union loss at Sabine Cross Roads and Pleasant Grove was about 1,050 killed and wounded and nearly 1,800 missing; the Confederate loss, 1,500 killed and wounded.

Banks had been limited as to time in carrying out the objects of his campaign. General Sherman was calling for A. J. Smith's troops, and General Grant, who had set his heart on a movement by Banks from New Orleans on Mobile, had written him: "I had much rather that the Red River expedition had never been begun, than that you should be detained one day beyond the first day of May, in commencing the movement east of the Mississippi." The allotted time was fast expiring, Banks concluded to abandon his expedition. The night of the 8th he fell back 15 miles to Pleasant Hill, which was reached by Emory's division, that brought up the rear about 9 o'clock next morning. A. J. Smith, with a part of his command, had halted at Pleasant Hill, on the evening of the 8th, and with less than 13,000 men Banks formed a double line; the first, of the 19th corps, along a thickly wooded slope half a mile west of Pleasant Hill; the second, of A. J. Smith's command and the artillery, on a plateau in rear. The trains, preceded by Lee's cavalry and Dickey's brigade of colored troops, and followed by the remnants of Ransom's division, were put on the road to Grand Ecore. General Taylor, reinforced by the divisions of Generals Churchill and Parsons, had followed Banks very cautiously, and at noon his advance appeared and began skirmishing. Later artillery was brought up and opened fire, and a demonstration was made on the Union right. About 5 P.M. three Confederate divisions charged out of the woods upon the left flank of the Union line, which was steadily driven back up the hill to the cover of the second line.

Here the Confederates were repulsed with great loss. Meanwhile the right of the Union line, though hard pressed, stood firm until, the left being driven back, it was nearly enveloped and gave ground, and the Confederates pressed on to an attack on A. J. Smith, who held the second line in reserve. After a short and sharp exchange of fire, Smith's and part of Emory's men made a charge and pushed back the Confederate line. All the reserves were now thrown into action, and the Confederates were routed, driven from the field and pursued until dark. Gen. E. Kirby Smith, the Confederate department commander, says: "Our troops attacked with vigor and at first with success, but, exposing their right flank, were finally repulsed and thrown into confusion. The Missouri and Arkansas troops, with a brigade of Walker's division, were broken and scattered. The enemy recovered cannon which we had captured the day before, and two of our pieces with the dead and wounded were left on the field. Our troops were completely paralyzed and disorganized by the repulse. . . . Our repulse at Pleasant Hill was so complete and our command was so disorganized that had Banks followed up his success vigorously he would have met but feeble opposition to his advance on Shreveport."

Banks had at Pleasant Hill 12,600 men, of whom 150 were killed, 844 wounded and 375 missing. Taylor had 14,300 engaged, of whom about 1,000 were killed and wounded, and nearly 500 missing.

Encouraged by his success at Pleasant Hill, Banks gave orders for a forward movement next morning on Shreveport, and preparations were being made for the march, when General Franklin and other officers dissuaded him from it, and it was decided to fall back to Grand Ecore and unite with the fleet. The retreat was resumed during the night and Grand Ecore reached on the 11th. E. Kirby Smith joined Taylor after the close of the battle of Pleasant Hill, and determined to move against General Steele in Arkansas. Taylor withdrew his infantry to Mansfield on the 10th and 11th, leaving the cavalry, under Green, and Polignac's infantry division of 2,000 men to watch and harass Banks. Upon his arrival at Grand Ecore, Banks intrenched, threw a pontoon-bridge across the river, put part of his force on the other side and waited for the fleet to come down. Porter, with the gunboats and Kirby Smith, with the transports, had arrived at Loggy Bayou on the afternoon of the 10th, where, two hours later, they received news of Banks' misfortunes, and on the morning of the 11th received his orders to return to Grand Ecore. The fleet turned down stream, but it was not to reach Grand Ecore without opposition. On the evening of the 11th Green, who had been left at Pleasant Hill, started with 750 men and two batteries for Blair's Landing, and on the 12th, with about 500 men and three guns, attacked the fleet and transports as they were running down the river. A brisk fight followed, General Green was killed by a discharge of grape from one of the gunboats and his men were driven off, with small loss. The Union loss was 57 killed and wounded. By the 15th all the gunboats were back to Grand Ecore, and as fast as the vessels could pass the bar they made their way to Alexandria, one

gunboat being lost. The fleet having passed down, Banks marched from Grand Ecore on the 22d for Alexandria, and that night bivouacked at Clouterville, 32 miles from Grand Ecore. The march was resumed on the 22d, and on the morning of the 23d, while marching along Cane River, a branch of the Red, the head of the column was checked at Monett's Ferry by General Bee, with four brigades of 2,000 men and four batteries. Bee's position was a strong one on a bluff commanding the crossing, and on the only practicable road to Alexandria, 35 miles distant. At the same time the Confederate cavalry under General Wharton and Polignac's infantry were harassing Banks' rear. General Birge, with his own brigade and Cameron's division of the 13th corps, in all about 5,000 men, crossed Cane River three miles above the ferry, and by a difficult flank march of several miles reached a hill, the occupation of which rendered Monett's Bluff untenable. Birge attacked at 2 p.m., after a contest of two hours carried the hill, and the Confederates retreated and left open the road to Alexandria. The Union loss was 150 to 200 killed and wounded. Banks resumed his march on the 24th, and without further serious opposition entered Alexandria on the 25th. Banks reported that in the 24 days intervening between the march of the army from Alexandria and its return there his own army had marched 400 miles. He had fought several battles, and been successful in all but one, and his losses were 289 killed, 1,541 wounded and 2,150 missing, an aggregate of 3,980. The difficulty of getting Porter's fleet over the shallow rapids near Alexandria detained Banks at that place until 13 May, when he continued his retreat. (See YELLOW BAYOU, ENGAGEMENT AT). Consult 'Official Records' (Vol. XXXIV); Taylor, 'Destruction and Reconstruction'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

SABINE MOUNTAINS, Italy, a branch of the Apennines, near the border of ancient Latium, east of Rome, is a lofty group in the upper valley of the Aternus; the highest summit reaches an altitude of about 4,200 feet.

SABINE PASS, Engagement at. On 6 Aug. 1863 General Halleck informed General Banks, in command at New Orleans, that there were important reasons why the United States' flag should be raised at some point in Texas, with the least possible delay. Halleck's dispatch was by direction of the Secretary of War, and it was understood that the proposed movement was of diplomatic rather than a military character, and intended to prevent European complications. Banks was left to his own judgment how to conduct the campaign, but it was suggested that the most feasible route would be by the Red River to Shreveport. Banks, deeming the Red River route impracticable at that season of the year, fitted out an expedition to make a lodgment in Texas at Sabine City, on Sabine Pass, the outlet from Sabine Lake into the Gulf of Mexico, and the terminus of a railroad penetrating eastern Texas, and making connection with Houston, the capital of the State. General Franklin was put in charge of the advance of the expedition of 5,000 men, and was instructed to land a

few miles below Sabine Pass, move upon the Confederate works commanding it, and, if practicable, to seize Beaumont, on the railroad to Houston. Four light-draft gunboats, under command of Lieutenant Crocker, formed part of the expedition, which sailed from New Orleans on 4 September. Franklin disregarded his instructions to land 10 or 12 miles below Sabine Pass, and on Crocker's representation that he could silence the Confederate works in the pass, he and Crocker arranged for the gunboats to make a direct attack upon the works, drive out the garrison, seize or drive away two Confederate gunboats reported on the river and then land the troops. From the army 150 sharpshooters were distributed on the four gunboats. Early in the forenoon of the eighth the gunboats and transports crossed the bar at Sabine Pass, and in the middle of the afternoon three of the gunboats opened fire upon the small fort, mounting eight heavy guns, and held by 44 officers and men. The fire was immediately returned, two of the gunboats were disabled and surrendered and were taken in tow by two small Confederate craft. It was all over in less than an hour. Franklin made no serious attempt to land his troops, but immediately returned to New Orleans, having lost two gunboats, with their 15 heavy guns, nearly 50 killed and wounded and over 200 prisoners, among them Lieutenant Crocker, of the navy. Not a Confederate was hurt. Consult 'Official Records' (Vol. XXVI).

SABINES, sā'bīnz (Lat. SABINI, sa-bī'nī), a people noted in the early history of Rome, whose territory they adjoined. The Sabines were engaged in agriculture and grazing, and from the simplicity of their lives and their physical prowess they obtained a reputation like that of the Spartans for severity of discipline and sturdiness of character. The narrow limits of the Sabine territory made emigration necessary, and probably in this way they came in contact with the growing power of Rome. They fought the Romans with great courage, but were subdued about 290 B.C., and admitted to Roman citizenship, but not permitted to vote in civic affairs. They became merged in the republic and subsequent empire, and were lost to view as a separate people.

SABINUS, Masurius, Roman jurist. He flourished during the reign of Tiberius, and was a pupil of Capito. He was the founder of the school of Sabiniani, and was the author of several works much used and commented upon by later jurists, the most important being 'Libri iii, Juris Civilis,' which is not now extant.

SABLE, one of the fur-bearing animals (*Mustela sibirica*), found in Siberia, Asiatic Russia and Kamchatka, or its American representative (*M. americana*) which differs so little that it is doubtfully named as a separate species. The average length of the sable is about 18 inches, excluding the tail, which is somewhat bushy. The body partakes of the form of the weasels generally, in that it is elongated and vermiform. The fur is smooth, glossy and may be pressed or smoothed in any direction, owing to the mode of attachment of the hairs to the skin. In color it is a rich deep brown, which near the head may exhibit white markings, and frequently assumes a gray tint about the neck. The fur is heaviest during winter, and the dan-

gers experienced by the sable-hunters from sudden snow-storms obliterating the track, or from the inclement cold, can hardly be overestimated. Sables are for the most part captured in traps, but are cautious animals, and their pursuit is attended with much difficulty. They make their homes in dens or cavities in hollow trees, and produce from three to five young at a birth, the young being born in March or April; and their general habits are those of the marten and weasel, but they are more shy and retiring.

Skins of the Russian sable fetch prices in Liverpool ranging from 3 to 10 guineas. The darkest skins are considered to be the finest. About 2,000 skins annually find their way to England. Most of these furs are used in Russia, where about 25,000 are said to be annually collected. When manufactured for linings sable fur may fetch prices as high as 1,000 guineas. The corporation robes of the London aldermen are lined with this expensive material, and the tails of sables are used in the manufacture of artists' brushes. See FUR-BEARING ANIMALS; FUR-TRADE.

SABLE, Cape. See CAPE SABLE.

SABLE ANTELOPE, one of the largest and most handsome of African antelopes (*Hippotragus niger*), of the same genus as the roan antelope, blaubok and others, and like them rapidly approaching extinction, as civilization more and more encroaches upon the plains of southern and eastern Africa. Its coat is a deep glossy black, markings upon the face, the buttock and the under parts being white. The great-ringed horns sweep back from the forehead in a sabre-like curve, and the neck is adorned with a mane. These antelopes went about, in old times, in herds, and were prizes for the sportsmen, while their flesh was excellent to eat. Extensive descriptions may be found in the writings of Gordon-Cummings, Anderson, Baker, Selous, Bryden and other African sportsmen-travelers.

SABLE ISLAND, a low-lying island in the Atlantic, in lat. 44° N. and long. 60° W., 85 miles east of Nova Scotia. It is a chain of sand dunes enclosing a lagoon, and is such a menace to navigation that the government of Canada maintains two lighthouses there. It was formerly 40 miles long and is now but 20, gradually sinking. Upon its sandy ridges grow cranberries and wild grass, and attempts are being made to raise pines and other hardy evergreens. There are sandbanks in the vicinity. The only inhabitants are the lighthouse and lifeboat men attached to the establishment for the relief of shipwrecked persons. The island is known for its breed of hardy wild ponies.

SABOTAGE, sà-bo-tázh, a method used by labor revolutionists to force employers to accede to demands made on them. It consists in a wilful obstruction and interference with the normal processes of industry. It aims at inconveniencing and tying up of production, but stops short of actual destruction or of endangering human life directly. The practices are varied. The original act of sabotage is said to have been the slipping of the wooden shoe or "sabot" of a workman into a loom, in the early days of the introduction of machinery, to impede production. Some of the more common forms are wasting of materials; telling

the exact truth to customers; obeying orders punctiliously, especially on railroads; using of bad materials so as to impair the standing of the employer; placing sand or emery in wheel bearings; loosening screws and nuts; cutting belts; sitting idle at machines; mislaying tools, and any number of petty devices for hindering and delaying production. These methods were found to be more subtly effective by the syndicalists, and have been endorsed also by the I. W. W. (q.v.). Sabotage is conducted secretly, so that the blame cannot be fixed and the criminal law is thus avoided. Many prominent labor leaders consider it a slavish, wasteful and sterile instrument and prefer the strike as a form of direct action. Consult Brooks, J. G., 'American Syndicalism: the I. W. W.' (Chap. XII, New York 1913).

SABOTS, sà-bōz', wooden shoes largely worn by the peasantry of France, Belgium, Holland and some other parts of Europe. They are especially useful in wet weather, and in moist places generally, being well adapted to preserve the feet from damp. Great numbers of sabots have been exported by France to Belgium. In some parts of England, as in Lancashire, shoes with thick wooden soles, but with leather vamps or "uppers," are worn by most of the artisan class. See BOOTS AND SHOES.

SABRE-TOOTHED TIGERS, extinct cats of the family *Machærodontidæ* (or *Nimravida*), a group whose remains occur as fossils from the Eocene up to the Pleistocene. They differ from ordinary cats (*Felidæ*) in several anatomical features, having some peculiarities which ally them to the bears, and others recalling existing viverroids, as the foussa (*Cryptoprocta*). They are remarkable for the character of the dentition, which in the earlier genera comes near showing the complete number of teeth, but displays a steady tendency as the family history is followed toward the reduced number possessed by existing cats. At the same time the dentition is often distinguished by the huge size of the upper canines, which in some cases were five or six times as long as the neighboring teeth, and have been justly called "sabre-teeth." These tushes reached their highest development in the genus *Machæodus*, whose species were of very wide distribution, occurring in both North and South America and in Europe. These carnivores were of various sizes, up to dimensions equal to those of modern tigers, and so little different in general from true cats that Cope places them within the *Felidæ*. It began in the Eocene and continued down almost or quite to the Glacial Period, when the type seems to have become extinct because the great canines had overgrown their usefulness and become a hindrance instead of a help in getting a living. They finally became so large that the animal could not open its mouth wide enough to make use of them in biting, and the space between them would admit none but a very small piece of meat to enter, even if a large piece could be torn away. "Even when the mouth opens so far as to allow the mandible to pass behind the apices of the canines," remarks Cope, "there would appear to be some risk of the latter being caught on the point of one or the other canine, and forced to remain open, caus-

ing early starvation.⁹ Other prominent genera in the family are the plantigrade *Dimictis*; *Nimravus* and *Pogonodon*, with species as large as panthers; and *Hoplophoneus*, with dentition like modern cats. Consult Flower and Lydekker, 'Mammals, Living and Extinct' (1891); Cope, 'Vertebrates of the Tertiary Formation of the West' (in Report United States Geological Survey, Vol. III, Washington 1884); Woodward, 'Vertebrate Palaeontology' (1898).

SABRE-TACHE, sā-br-tāsh, a leathern case or pocket worn by cavalry officers at the left side, suspended by three straps from their swordbelt. It came into use when the jackets of cavalry soldiers were too short or too tight to admit of pockets being made in them, but is now rather ornamental than useful.

SAC (sāk) **CITY**, Iowa, county-seat of Sac County, on the north fork of the Raccoon River, and on the Chicago, Milwaukee and Saint Paul and the Chicago and Northwestern railroads, about 42 miles west by south of Fort Dodge. It is in an agricultural region where considerable attention is given to raising livestock. The chief manufacturing industries are connected with farm products. The trade is mainly in farm and dairy products, flour and agricultural implements. The educational institutions are the Sac City Institute (Baptist), a high school, public elementary schools and a public library. Pop. about 2,500.

SAC AND FOX INDIANS, also known as **MUSKWAKI**, an Algonquian people called by the French Foxes (*Renards*), possibly because of their having a Fox clan. To themselves they were Muskwaki or red-earth people. When first noticed by the whites they inhabited central Wisconsin. The Ojibwas had driven them from the Lake Superior region and about 1760, being worsted in conflict with the French, they incorporated with the Sac tribe, with whom they have remained so intimately connected as to have been long regarded as one tribe. They are of the woodland type, formerly lived in bark houses and cultivated corn and vegetables. They developed a complex social organization and are noted for their conservativeness in adopting the customs of the whites. Their number at present is about 750. Consult Owen, M. A., 'Folk-lore of the Musquakie Indians of North America' (London 1904), and 'Handbook of American Indians' (Washington 1907).

SAC FUNGI. See **FUNGI**.

SAC-À-LAIT, sāk'ā-lā, a fish. See **CRAPPIE**.

SACAJAWEA, sā-ka'ja-wē'a, **SACAGCEWEA**, **SAHKAHGARWEA**, or **SAHCARGARWEAH** (Minnetarre name *Tsa-ka-ka-wias*, "BIRD WOMAN"; Shoshone name *Bo-i-naiv*, "GRASS MAIDEN"), American Indian guide of the Shoshone tribe, the only woman to accompany the Lewis and Clark Expedition of 1804-06: b. about 1784; d. Shoshone Agency, Wyo., 9 April 1884. She was betrothed in infancy according to tribal custom, but was captured by the Minnetarres when a child and later gambled away by her captor to a Frenchman named Charboneau, whose wife she became and with whom she was living in the Dakotas when Lewis and Clark reached there. Charboneau and Sacajawea were engaged as guides and spent the winter at Fort Mandan,

where Sacajawea's son, Baptiste, was born 11 Feb. 1805. Sacajawea displayed remarkable ability as a guide, threading the way accurately to her own country which she had not seen since she was a child, and gaining the admiration of the expedition for her courage and resourcefulness. On one occasion at the risk of her life she rescued from an overturned canoe the records of the expedition and other light articles of great value to the explorers. She led the party to the camps of her own people 17 Aug. 1805, where she was immediately recognized, her affecting meeting with her brother Cameahwait, chief of the tribe, being described in the journals kept by Lewis and Clark. She was claimed by her betrothed husband, who, however, relinquished his claims upon finding her the wife of another and mother of a son whom she had carried on her back all the way. Here the devotion of the Indian woman procured for the white men food and horses from the Indians, while her shrewd sense and good counsels prevailed over her brother's determination to destroy the whites for the sake of their goods. Finding all her people dead except her brother and the child of a dead sister she immediately adopted the sister's child as her own, and according to the custom of her people never admitted the sister's son to be other than her own. This child, of pure Indian blood, was known as Basil; both children lived and had descendants. Sacajawea accompanied the party to the ocean, which was reached 7 Nov. 1805, and returned with Captain Clark by way of the Yellowstone, which region also she knew well. Upon their return to the Minnetarre country Charboneau refused all inducements to accompany the explorers to civilization, and Sacajawea remained with him. Further mention is made of her and her son Baptiste in Clark's letters, but she then disappears until she was found, an old woman, in the Shoshone Agency. She told a clear and intelligible story, and although illiterate spoke excellent French, which, however, she spoke with less ease in the earlier days of the expedition. She died of old age when about 100 years old. Monuments have been erected to her at Portland, Ore.; Bismarck, N. D., and by the State of Wyoming. Consult 'Sacajawea' in *Journal of American History* (September 1907); 'Journals of Lewis and Clark Expedition' (ed. by Thwaites, R. G., 8 vols, 1904; Schultz, J. W., 'Bird Woman' (1918)).

SACBUT, or **SACKBUT**, the word by which translators have rendered the *sabbeka* of the Hebrew Scriptures. The exact form of the *sabbeka* has been much disputed, but that it was a stringed instrument is certain, for the name passed over into Greek and Latin in the forms *sambuke*, *sambuca*, and the instrument so called is described by Athenæus as a harplike instrument of four or more strings, and of a triangular form. It is not unlikely that this instrument was introduced among the Jews from the East, since one of the musical instruments most frequently occurring in the Assyrian sculptures answers very closely to this description, and may perhaps be identified with the *sabbeka*, the name of which is, besides, Chaldaic. Nothing resembling this Assyrian instrument is to be found on the Egyptian monuments or in the sculptures of Greece and Rome. Since the sab-

beka was a stringed instrument the rendering sacbut is altogether wrong, since that was, at the time when our translation of the Scriptures was made, the name of a wind-instrument now called the trombone. See TROMBONE.

SACCATON GRASS. See GRASSES OF THE UNITED STATES.

SACCHARIN, sāk'ka-rin, benzoic sulphide, $C_6H_4 \begin{smallmatrix} \diagup CO \\ \diagdown SO_2 \end{smallmatrix} NH$, has attained commercial

importance and is manufactured on a large scale in many countries on account of its intense sweet taste, chemically pure saccharin being 500 times sweeter than cane sugar. The compound was discovered in 1879 by I. Remsen and C. Fahlberg during an investigation of the oxidation products of toluene sulphone amide. According to a process outlined in D.R.P. 35, 211, saccharin is manufactured from toluene by treating this with sulphuric acid at temperatures not exceeding 100° C. The product is converted into the calcium salt, then into the sodium salt. With phosphorus trichloride in a stream of chlorine the dry sodium salt yields a mixture of ortho- and para-toluene sulphone chlorides. The solid para compound is worthless as far as the manufacture of saccharin is concerned, but the oily ortho compound will, upon saturation with ammonia, yield toluene-ortho-sulphone amide, and the latter is readily oxidized into saccharin with a solution of neutral potassium permanganate. A more general method for the manufacture of saccharin consists of the treatment of toluene with excess of chlorosulphonic acid at very low temperatures. The reaction mixture is first poured on ice and then cooled for several hours at -20° C. The oily ortho compound is now separated from the solid para compound by filtration; the oil is treated with dry ammonium carbonate, or dry ammonia gas, and finally oxidized into saccharin with a neutral solution of potassium permanganate.

Saccharin is a white crystalline substance which melts with partial decomposition at 220° C. It is readily soluble in acetone, alcohol and ether, sparingly in benzene, toluene and amyl alcohol. Although its solubility in water is not very great—one part in 230 parts of water at 25° C.—the water solution possesses an intense sweet taste. Saccharin behaves like an acid, forming soluble crystalline salts with a number of metallic hydroxides and carbonates. Some of these salts possess the intense sweet taste of the original compound. The sodium

salt, $C_6H_4 \begin{smallmatrix} \diagup CO \\ \diagdown SO_2 \end{smallmatrix} NNa \cdot 2H_2O$, is the commercial

"crystallose," 400 times sweeter than cane sugar, and being very soluble in water is extensively used as a sweetening medium in preference to the less soluble saccharin.

Saccharin is used as a substitute for cane sugar in the treatment of diabetes, dyspepsia, obesity and in gastro-intestinal infections. According to some authorities the compound is rapidly absorbed and eliminated practically unchanged through the kidneys without producing digestive troubles or toxic effects. On account of its antiseptic properties saccharin has not found universal favor as an artificial sweetener in foods, confectionery and beverages. Saccharinated cake and pastry have been

condemned as indigestible foods, and government regulations require that in liquors, syrups and the like the presence and amount of saccharin be plainly declared upon the label.

V. S. BABASINIAN,

Professor of Chemistry, Lehigh University.

SACCHAROMETER, or **SACCHARIMETER**, any instrument used to determine the strength of a sugar solution. One common form is a hydrometer with the stem so graduated as to read per cents of sugar content in solution examined. Another is a form of polariscope devised by Mitscherlich with the scale on which the angle of deviation of the plane of polarized light is read so graduated as to show the percentage of sugar in the solution used. Another instrument of this type is the invention of Soleil.

SACCOPHARYNX, a genus of *Muraenidae*, with a single species (*S. flagellum*), a deep-sea conger eel, of which only three specimens have been observed; muscular system very feebly developed; bones thin and soft, wanting in organic matter; head and gape enormous; stomach distensible in an extraordinary degree; vent at end of trunk. The specimens known have been found floating on the surface of the north Atlantic with their stomachs much distended, having swallowed some other fish many times their own weight. They attain a length of several feet. See DEEP SEA EXPLORATION.

SACHEVERELL, sǎ-shěv'ē-rēl, Henry, English Anglican divine: b. Wiltshire, about 1674; d. London, 5 June 1724. He was educated at Oxford and in 1705 was appointed preacher of Saint Saviour's, Southwark. While in this station he, in 1709, preached two famous sermons, the object of which was to rouse apprehensions for the safety of the Church and to excite hostility against the Dissenters. Being impeached in the House of Commons he was brought to trial in February 1710, and on 23 March, when the trial was concluded, was suspended from preaching for three years. This prosecution, however, excited such a spirit in the High Church party that it helped to overthrow the ministry of Godolphin, and established the fortune of Sacheverell, who, during his suspension, made a kind of triumphal progress through the kingdom. The same month that his suspension terminated (1713) he was appointed to the valuable rectory of Saint Andrew's, Holborn, by Queen Anne. Of the offending sermons 40,000 copies at least were sold, and of the record of the trial 30,000. Little was heard of Sacheverell after this party ebullition subsided, except through his numerous squabbles with his parishioners. His abilities, even according to writers on his own side, were very slight. Consult Stanhope, 'History of Queen Anne's Reign' (1872).

SACHS, saks, Bernard, American neurologist: b. Baltimore, Md., 2 June 1858. He was graduated from Harvard and the University of Strassburg, Germany, in 1882, and engaged as a medical practitioner in New York. He has made a specialty of the study of nervous diseases, regarding which he is a recognized authority. Besides numerous medical monographs he has published 'Mental and Nervous Diseases of Children' (1895).

SACHS, Edwin O., English architect: b. London, 5 April 1870. He was educated at University College School, London, and at the University of Berlin, and engaged as an architect in London in 1892. He has established a wide practice in connection with theatres and public buildings and in 1898 applied electrical power to the working of the stage for the first time in England. He founded the British Fire Prevention Committee in 1897 and organized the first International Fire Prevention Congress in London in 1903; organized Special Fire Survey Force in connection with the European War. He has published 'Modern Opera Houses and Theatres' (3 vols., 1896-98); 'Facts on Fire Prevention' (1902); 'Stage Construction' (1898); 'Fires and Public Entertainments' (1897).

SACHS, Hans, hänts zäks, German meistersinger: b. Nuremberg, 5 Nov. 1494; d. there, 20 Jan. 1576. He was by trade a shoemaker, and followed his business and made verses with equal assiduity. From 1510 to 1515 he traveled over different parts of Germany, practising his craft, according to the custom of German workmen, in all the towns he visited. In the latter year he returned to his native town, where he was admitted as master in his guild. He early attached himself to the Reformation movement, to the spread of which among the *bourgeoisie* he contributed not a little by a poem written in 1523, 'Die wittenbergisch Nachtigall, Die man jetzt höret überall,' in which he hailed with approval the cause of Luther. In 1544 he was with the army of Charles V in France. The productions of Hans Sachs are extremely numerous. In 1536 he estimated the number of his poems at 5,000 or more. Three volumes of his poems were published during his lifetime, and two more after his death. In the 17th century, after the introduction of a more artificial style into German poetry, Hans Sachs fell into neglect, from which he was not withdrawn till Goethe, who had become acquainted with him in his studies for 'Faust,' drew attention to his merit in a poem ('Erklärung eines alten Holzschnitts vorstellend Hans Sachsens Poetische Sendung') which appeared in the *Deutscher Merkur* (April 1776). The best edition of his works is that of Keller and Goetze, and the best selection that of Gödeke and Tittmann in 'Deutsche Dichter des sechzehnten Jahrhunderts' (2d ed., 1883-85). He possessed a fruitful genius and, notwithstanding the rudeness of his language, his poems are distinguished for naïveté, feeling, invention, wit and striking description. Consult Schweitzer's 'Étude' (1889); Goetze's 'Hans Sachs' (1894); Genée's 'Hans Sachs und seine Zeit' (1894), and Drescher, 'Studien zu Hans Sachs' (1891).

SACHS, Julius, German botanist: b. Breslau, 2 Oct. 1832; d. Würzburg, 29 May 1897. He studied in Prague, where he became assistant in botany, and in 1867 became professor of botany at Freiburg. The following year he removed to Würzburg, where in his own laboratory he made extremely important experiments in the physiology of plants. He published 'Handbuch der Experimental-physiologie der Pflanzen' (1865); 'Lehrbuch der Botanik' (1868-74); 'Vorlesungen über Pflanzenphysiologie' (1882-87); 'Geschichte der Botanik vom 16. Jahrh.

bis 1860' (1875); 'Gesammelte Abhandlungen über Pflanzenphysiologie' (1892-93).

SACHS, Julius, American educator: b. Baltimore, Md., 6 July 1849. He was graduated at Columbia University in 1867 and later studied at the universities of Würzburg, Berlin, Göttingen and Rostock. In 1872-1902 he was engaged as principal of preparatory schools, and in 1902-17 he was professor of secondary education at Teachers' College, Columbia University, where he has since been professor emeritus. In 1890-91 he was president of the American Philological Association, and he filled that office for the Head Masters' Association of the United States in 1899. Author of 'Syllabus of a General Course on the Theory and Practice of Teaching in the Secondary Schools' (1909); 'The American Secondary School' (1912), etc.

SACHSE, säkse', Julius Friedrich, American author: b. Philadelphia, Pa., 22 Nov. 1842. He has been librarian and curator of the Masonic Temple since 1906. He engaged in journalism and has written extensively, his publications including 'The German Pietists of Provincial Pennsylvania, 1694-1708'; 'Horologium Achaz-Christophorus Schissler, Artifex'; 'Justus Falckner, Mystic and Scholar' (1903); 'Pennsylvania: the German Influence in its Settlement and Development'; 'The German Sectarians of Pennsylvania, 1708-1803'; 'The Wayside Inns on the Lancaster Roadside'; 'Old Masonic Lodges of Pennsylvania, Modern and Ancient 1730-1800'; 'The Masonic Correspondence of George Washington,' etc.

SACHSENHAUSEN, zäk'sën-how-zën. See FRANKFORT-ON-THE-MAIN.

SACHSENSPIEGEL, zäk'sën-spē'gël, a private collection of legal precepts and legal customs which had the force of law in the Middle Ages in Germany, especially in the north of Germany. One of the six prefaces to the collection mentions one Eyke von Repgow as its author, and this account is generally accepted as true. Its date is supposed to be earlier than 1235. The study of it has been revived in Germany. The best edition is by Homeyer (Berlin 1835-44).

SACKBUT. See SACBUT.

SACKEN. See BUGONIA.

SACKETTS (säk'ëts) HARBOR, N. Y., village, in Jefferson County, on Black River Bay, the inlet through which Black River discharges its waters into Lake Ontario, and on the Rome, Watertown and Ogdensburg branch of the New York Central and Hudson River Railroad. The village is about 10 miles from Watertown, eight miles from Lake Ontario and 170 miles west-northwest of Albany. It has a good harbor, large enough to accommodate vessels of the largest size, and it has steamer connections with several of the lake ports. Sacketts Harbor is one of the oldest places on the northern frontier; in 1809 the *Oneida*, the first United States war vessel, was built here. In the War of 1812 the village was the scene of several engagements and was an important United States naval station. The frigates *Madison* and *Superior*, war vessels, were made here in 40 and 80 days, respectively,

from the time the timber was cut. A third warship was nearly completed when peace was restored; the hulk remained in the yard for a number of years. The United States military station, Madison Barracks, is located here. Sacketts Harbor is in an agricultural region, and although it has good water power, there is but little manufacturing. Pop., exclusive of garrison, 868.

SACKETTS HARBOR, Attacks on, in the War of 1812. On the outbreak of the war the United States had only one ship on Lake Ontario, the *Oneida*, carrying 16 24-pounders and commanded by Lieut. Melancthon T. Woolsey. On 19 July 1812, when Woolsey was at Sackett's Harbor, a British fleet of six ships under Commodore Earle appeared with the object of capturing the *Oneida*. Woolsey attempted to escape but, failing in this, anchored the vessel where his guns could rake the entrance to the harbor and mounted on shore the guns from the off side of the ship. At the end of the peninsula he also erected some guns and after an hour's fight compelled the British fleet to withdraw without inflicting any damage. Consult Cooper, J. F., 'Naval History' (Vol. II, pp. 25, 147, 149); Maclay, E. S., 'History of the Navy' (Vol. I, pp. 472-473); Roosevelt, 'Naval War of 1812' (pp. 145, 151).

When Dearborn sent the expedition to York (q.v.) early in 1813, he left Sackett's Harbor in a defenseless condition, the garrison numbering only 400 regulars and 250 volunteers under Gen. Jacob Brown (q.v.). Accordingly on the night of 26-27 May 1813, while Dearborn was preparing to capture Fort George (q.v.), Sir George Prevost embarked about 800 men on the fleet under Sir James Yeo and on 29 May attacked the garrison at Sackett's Harbor. At the first onslaught the volunteer militia fled but when the British reached the blockhouse they were halted by the desperate resistance of the regulars. Meanwhile Brown rallied the fugitive militia and, attacking the British in the rear, compelled them to retreat. The British loss was 259 killed, wounded and missing. During the battle the naval lieutenant in charge of the shipyard, believing the battle lost, set fire to the barracks, burning the storehouses and doing considerable damage to ships on the stocks. Yeo then returned to Kingston where he remained inactive several weeks. Consult Adams, 'The United States' (Vol. VII, pp. 163-171); Armstrong, John, 'Notices of the War of 1812' (Vol. I, pp. 145-147); Maclay, 'History of the Navy' (Vol. I, pp. 481-482); Lossing, 'War of 1812' (pp. 607-613); Roosevelt, 'Naval War of 1812' (pp. 233-234); Wilkinson, James, 'Memoirs' (Vol. I, pp. 582-584, 634-638); Wiley and Rines, 'The United States' (Vol. V, pp. 408-409).

On 19 May 1814 Yeo blockaded the harbor to prevent the exit of American frigates then under construction. Most of the supplies for the ships were at Oswego Falls a few miles away and on 28 May Woolsey attempted to carry these supplies in 19 small boats to Stony Creek and thence overland to the harbor. Yeo captured one of these boats before it reached Stony Creek and sent 180 men in seven small gunboats to capture Woolsey and his men. But the Americans ambushed the British and captured the whole force with their

boats. On 6 June Yeo raised the blockade. Consult Armstrong, 'Notices of the War of 1812' (Vol. II, pp. 73-74); Lossing, 'War of 1812' (pp. 789-800); Maclay, 'History of the Navy' (Vol. I, pp. 488-489); Roosevelt, 'Naval War of 1812' (pp. 360-361); Wiley and Rines, 'The United States' (Vol. V, pp. 422-423).

SACKVILLE, säk'vil, Charles, 6TH EARL OF DORSET, English courtier and poet: b. 24 Jan. 1638; d. Bath, 29 Jan. 1706. He became a wit and roisterer in the company of Charles II, served under the Duke of York in the sea fight with the Dutch in 1663 and is said to have written or retouched on the night before the engagement of 3 June his famous song, "To all you ladies now on land." He succeeded to the earldom in 1677, but did not stand well in the favor of James II, and later became an ardent supporter of William of Orange, under whom he was lord chamberlain of the household from 1689 to 1697, and three times one of the regents during the king's absence. He was a patron of poets like Prior and Wycherley, and Dryden dedicated to him the 'Essay on Satire.'

SACKVILLE, Lionel Sackville Sackville-West, BARON, English diplomatist: b. Cambridgeshire, 19 July 1827; d. Knole Park, Sevenoaks, England, 3 Sept. 1908. He entered the diplomatic service in 1847, was secretary of legation, respectively, at Turin, Madrid, Berlin and Paris, and was Envoy Extraordinary and Minister Plenipotentiary to the Argentine Confederation (1872-78) and to Spain (1878-81). In 1881 he was appointed Minister to the United States, and in 1888 with Joseph Chamberlain and Sir Charles Tupper negotiated the fisheries treaty of that year. In October 1888 he received a letter from one C. F. Murchison, who, representing himself as an Englishman naturalized in the United States, asked for which party he should vote in the ensuing Presidential election. The Minister in reply advised his correspondent to vote the Democratic ticket as favorable to English interests. The Murchison letter was generally regarded as a trap set for the embarrassment of the Minister. His recall was at once asked for, and in default of a prompt compliance with the request the Department of State sent him his passports 30 October. The incident, occurring as it did during a Presidential canvass, was the subject of much discussion.

SACKVILLE, Thomas, EARL OF DORSET and BARON BUCKHURST, English statesman and poet: b. Withyham parish, Sussex, 1536; d. London, 19 April 1608. He was a student in the University of Oxford, but removed to Cambridge, and afterward became a student of the Inner Temple. At both universities he was distinguished for his performances in Latin and English poetry, and in the Temple wrote the last two acts of the tragedy of 'Gorboduc, or Ferrex and Porrex' (1565). Of a poem intended to comprehend a view of the illustrious but unfortunate characters in English history, entitled the 'Mirror for Magistrates,' he finished only a poetical preface (the 'Induction') and one legend of the life of the Duke of Buckingham. The work was completed by George Ferrers and Richard Baldwin (1559-63). He sat in the Parliament assembling 20 Jan. 1558, and in the first two Parliaments of Eliza-

beth (1559-63) after which he traveled. In 1586 he was made a member of the court appointed by Elizabeth to try Mary Queen of Scots. In 1598 he was joined with Burleigh in negotiations for peace with Spain, and renewed a treaty with the United Provinces. On the death of Burleigh he became Lord High Treasurer. In January 1601 he was appointed lord high steward and presided at the trial of the Earl of Essex. On the accession of James I his post as treasurer was confirmed to him and in 1604 he was created Earl of Dorset. He ranks among the most prudent and able of the ministers of Elizabeth, was a good speaker and a still better writer. The tragedy of 'Gorboduc,' the subject of which is a sanguinary story from early British history, is the first example in English of regular tragedy in blank verse. Sackville's share is inferior in literary value to his 'Induction,' called by Sidney Lee the greatest English poem between the 'Canterbury Tales' and the 'Faerie Queene.'

SACKVILLE, Canada, town in Westmoreland County, 95 miles northeast of Saint John, on the Intercolonial Railway. The Wesleyan Mount Allison College is located here. Pop. 2,039.

SACO, José Antonio, hō-sā' ān-tō'nē-ō sā'kō, Cuban historian and publicist: b. Bayamo, Cuba, 7 May 1797; d. Madrid, Spain, 26 Sept. 1879. He was educated in Havana and in 1821 was appointed professor of philosophy in the Seminary of San Carlos. In 1832-34 he lived in Havana and edited the *Revisita Bimestre Cubana*, but his liberal and anti-slavery principles caused his banishment, though he was afterward allowed to return. He traveled in Europe and in 1840 settled in Paris where he resided for many years. He was elected a delegate to Madrid in 1866 to advocate political reforms for Cuba and in 1878 was elected to the Spanish Cortes. He wrote 'Paralelo entre Cuba y algunas colonias inglesas' (1838); 'Supresión del tráfico de esclavos en Cuba' (1845); 'Ideas sobre la incorporación de Cuba á los E. U.' (1848); 'Historia de la esclavitud desde los tiempos más remotos' (1876 et seq.), etc.

SACO, sā'kō, Me., city in York County, on the Saco River and on the Boston and Maine Railroad, about 15 miles west-southwest of Portland and four miles from the ocean. Four bridges span the river connecting the city with Biddeford and other localities. A fall in the river of about 40 feet furnishes extensive water power. The tide-water extends to the falls. The chief manufacturing establishments are cotton mills, boot and shoe factories, lumber mills, manufactories of belting, brushes and cotton-mill machinery. The city has an extensive coast trade in cotton goods and other manufactures, and it ships considerable farm products. Old Orchard, a popular seaside resort, is in the vicinity. The principal public institutions are Thornton Academy; York Institute, founded in 1866; a public high school and elementary schools, two libraries, one home for the aged, several fine churches and a number of good business blocks. Pop. 6,583.

SACO, a river which rises in the White Mountains in New Hampshire and flows southeast through New Hampshire and Maine and enters the Atlantic Ocean. It is about 105

miles long and drains an area of 1,750 square miles. It is a swiftly flowing stream having a number of rapids and falls, which furnish abundant water power for manufacturing. Great Falls is 72 feet high.

SACRAMENT. See SACRAMENTS.

SACRAMENTALS, certain objects, actions or emblems, instituted or consecrated by Church authority, for the production of spiritual effects through which temporal benefits are experienced by believers. Of such are the sacramental wine, bread or wafer; the rites of dedication, consecration, benediction; the emblem of the Agnus Dei or sacrificial lamb of God, in the celebration of the Mass or the Holy Eucharist. (See SACRAMENTS). Consult Lamburg, A. A., 'Sacramentals of the Catholic Church' (New York 1892); Probst, F., 'Sakramente und Sakramentalien' (Tübingen 1872).

SACRAMENTARIANS, a religious term which at present is applied almost solely to members of the Protestant Episcopal Church in America and the Anglican Church in England and elsewhere, who sustain a "high" view of the efficacy of the sacraments. In past ecclesiastical history it had a wholly different meaning, and was applied to those Reformers who refused to agree to Luther's doctrine of the real presence of the body and blood of Christ in the bread and wine. The Sacramentarian party were the authors of the Tetrapolitan Confession, so called from the four cities of Strassburg, Constance, Lindau and Memmingen, which supported the Sacramentarian doctrines. This confession excluded all idea of a physical presence of Christ's body. The Swiss reformer Zwingli took a similar position on the question of Christ's presence in the Eucharist, and an article prepared by him declaring against the real presence was embodied in the confession of the Helvetic Church. The German Sacramentarians joined the general body of Protestants in resisting Charles V, and became merged with the Lutherans.

SACRAMENTO, Cal., city, county-seat of Sacramento County and capital of the State, on the Sacramento River and on the Southern Pacific and Western Pacific railroads, 90 miles northeast of San Francisco. The city is situated in lat. 38° 33' N., and long. 121° 20' W.; and is built on a broad, low plain, 30 feet above sea-level. The streets are wide and straight and cross each other at right angles. Shade trees are abundant. The shops and stores are built of brick and the dwellings mostly of wood. The city is noted for its beauty of environment, is the centre of an extensive agricultural and horticultural section; and has a mild, almost semi-tropical climate. The State capitol building, completed in 1874, at a cost of \$2,500,000, stands in a plaza covering 30 acres. There is a United States government building here, the Crocker Art Gallery, building of the Foresters, Odd Fellows, Masons and Fort Sutter (re-built), California State Bank, Roman Catholic cathedral, Sacramento Institute, College of the Christian Brothers, California State Library (140,000 volumes), Public Library (28,000 volumes), Howe's Academy, Saint Joseph's Academy, Heald's Business College, City Dispensary, Railroad Hospital and numerous churches, schools and charitable institutions.

The city has several daily newspapers and numerous weekly and monthly periodicals. Sacramento is the second manufacturing city in California and has a variety of industries, including flouring and grist mills, foundries and machine shops, canneries, potash works, lumber mills, manufactories for saddlery, harness, furniture, carriage, soap, candy, brooms, sewer and gas pipes, pumps, mattresses and crackers. The repair shops of both railroads are located here, giving employment to several thousand men. The industries of Sacramento represent a capital invested of over \$10,000,000, with an annual output valued at over \$15,000,000. The city exports immense quantities of flour and grist-mill products to China, Japan and Australia. The city is governed on the commission plan. There are well-equipped fire and police departments. The waterworks are owned and operated by the municipality. The assessed property valuation of the city is about \$62,453,070, which is 72 per cent of the market value. The tax rate is \$1.34 per \$100 assessed valuation. The streets are lighted by electricity. An annual State fair is held here, and an exhibition building, park and race course are maintained by the State Agricultural Society. The first white settlement on the site of Sacramento City was made in 1839, by Capt. John A. Sutter, a Swiss by birth, but a naturalized American citizen, who obtained a grant of 11 square leagues of land from the Mexican government. In 1841 Captain Sutter built a fort which he called New Helvetia. He took many of the neighboring Indians into his service, collected a few white trappers, and by virtue of his isolated position and the number of his adherents secured influence and importance in the territory. Sutter's Fort, as it was popularly called, was the first point in California settled by immigrants crossing the continent; with the increase of the population the trade and importance of New Helvetia kept apace, and in October 1848 there was an auction sale of lots in the town of "Sacramento," which was first named in the advertisement of the sale. In January 1849 the first frame house was built on the banks of the Sacramento River, and thither the settlement was moved from the fort. The site of the town was originally about 15 feet above low-water mark, and as the river frequently rose to 20 feet, the town was subjected to overflows. In January 1850, in March 1852 and again in January 1853, the city was flooded so that boats were used in going from house to house. After this the lower streets were raised five feet, and a levee was built which saved the city from subsequent floods. On 3 Nov. 1852 a conflagration destroyed 600 houses and other property, entailing a loss of \$5,000,000. In July 1854 another fire destroyed property valued at \$650,000. The State capital was established here by an act of the legislature on 25 Feb. 1854, but not until 1861 was a capitol building erected. On 3 Feb. 1856, the first railroad was opened between Sacramento and Folsom. In the gold days of 1849-50 Sacramento was the great mart of the mines, the base of supplies and the metropolitan centre of various mining camps. Steamers ran daily to San Francisco and up the river to Red Bluff. The California Stage Company with a capitalization of \$1,000,000 ran daily stages to Maryville, Nevada, Downieville, Stock-

ton, Jackson, Mokelumne Hill and other leading towns in the mining district. The city was first incorporated as a town in 1849, and was chartered as a city in 1863. Sacramento in 1860 had a population of 13,788; (1880) 21,420; (1890) 26,386; (1900) 29,282; (1910) 44,696; (1919) 75,000.

SACRAMENTO, a river in California which rises in the northern part of the State, flows south in the valley between the Sierra Nevada and the Coast Range, and uniting with the San Joaquin River (q.v.), both break through the Coast Range, and enter the Suisun Bay, from which the waters pass through a strait into the Bay of San Pablo, and to the Pacific through San Francisco Bay and the Golden Gate. The chief tributaries are the Pitt River, from the northeastern part of the State, and Feather River, which enters the Sacramento about 15 miles above the city of Sacramento. The Sacramento is about 400 miles long; from the source of the Pitt to the mouth of the Sacramento is about 600 miles. The river is navigable for about 270 miles from its mouth, and the Feather River for about 30 miles from the Sacramento. The debris from placer mining has been a hindrance to navigation; large sums have been expended to improve it. The Sacramento Valley is a fertile region, in which are raised large quantities of grain and fruits.

SACRAMENTO SALMON, PERCH, PIKE, etc., local names in California for various fishes caught in the Sacramento River, and more or less widely elsewhere. The salmon is the quinnat (q.v.). The Sacramento sturgeon is the white sturgeon. (See **STURGEON**). The Sacramento perch is a fish (*Archoplitis interruptus*) closely related to the Eastern rock-bass. (See **BASS**). It reaches from one to two feet in length, is blackish above, its sides are silvery, with about seven vertical blackish bars, more or less interrupted. It is an excellent food-fish. The Sacramento pike is a chub, from two to four feet in length. (See **SQUAW-FISH**). The sucker is a species (*Catostomus occidentalis*) formerly of great importance to the Indian population, but little esteemed in civilized markets.

SACRAMENTS. The Latin word *Sacramentum* was in the classical period a judicial and military technical term. The underlying concept seems to be consecration to a divinity, something set apart for that purpose as sacred and inviolable. Thus the term was applied in jurisprudence to the specified sum of money deposited with the judicial authorities by the parties to a suit, and was so designated either because the place of deposit was sacred, or because the sum forfeited by the losing party was used for religious purposes. In military parlance the word signified originally the preliminary engagement entered into by newly enlisted recruits, and afterward the military oath of allegiance which became obligatory after the Second Punic War (Liv. XXII, 38). Later on the term was used to designate any oath or solemn engagement whatever.

Among ecclesiastical writers the word has had various significations. In earlier usage, represented, for instance, by the ancient Latin version of the Scriptures, and maintained even in many passages of the Vulgate (for example,

Eph. v, 32, Rev. i, 20, etc.) it was a synonym of *arcanum*, and corresponded in sense to the Greek word *μυστήριον*, the notion embodied being that of something secret or mysterious, whence also, by extension, it came to denote the sign or symbol whereby hidden things were signified, especially in matters referring to religion. Thus Augustine says: "Symbols when pertaining to things divine are called sacraments." As certain religious rites of paganism were called mysteries on account of their occult signification known only to the initiated, the equivalent word "sacrament" was naturally adopted by the early Christians to designate their own religious rites and ceremonies, and was used at first more or less indiscriminately with reference to any or all of them. There seems to have been no attempt on the part of early Christian writers to define the sacraments accurately or enumerate them. Thus they speak vaguely now of two, now of more sacraments, at times even restricting the term to the Eucharist as *the* sacrament, and opposing it to Baptism. Nor do we find in their writings any definition of a sacrament more explicit than the rather general notion formulated by Augustine, "a sign of something sacred." In the literary treatment of this as well as other doctrinal topics analytic precision and systematic classification came gradually with the development of theological thought.

Roman Catholic theologians of the mediæval and subsequent periods understand by sacraments, in the strict specific sense of the word, a definite category of sacred rites or symbols of divine institution, and which in virtue of this institution have the power of conferring instrumentally the grace or sanctity which they symbolically represent. Of these a certain number are allowed to have belonged to the Old Dispensation, being typical of the sacraments of the New Law, but the intrinsic efficiency attributed to them is limited (with, however, certain reserves in favor of the rite of circumcision taken to be the Old Testament type of Christian baptism) to the bestowal, not of internal, but external sanctity, that is, legal purifications, etc. With regard to the sacraments of the New Law, Roman Catholic theologians hold that they are seven in number instituted by Christ (namely, Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Holy Orders and Matrimony), and this enumeration, together with the main points of doctrine concerning the sacraments collectively and individually has been fixed by the dogmatic definitions of the Council of Trent.

The Reformers of the 16th century who professed to retain only such beliefs as were clearly demonstrated from Scripture rejected the doctrine of the seven sacraments, but did not at once agree as to the number to be admitted, some recognizing besides Baptism and the Eucharist, Confirmation, Penance and Orders, while others rejected one or the other or all of these last. As regards the present status of opinion, if we except the High Church section of the Anglican communion, Protestant denominations as a rule recognize only two sacraments — Baptism and the Eucharist.

That the existence of seven sacraments instituted by Christ cannot be proved from the New Testament alone must, of course, be

granted, even by Roman Catholic theologians, but they claim that such proof is not necessary, since, according to the fundamental Catholic contention, the New Testament writings do not furnish a complete record of Christ's actions — they are not, unless supplemented by tradition and the voice of the living Church, an adequate criterion of Christian belief and practice. They contend, moreover, that if the Scripture alone is to be held as decisive in the matter, consistency would require that the ceremony of the washing of the feet (John xiii) be counted among the sacraments, since it seems to fulfil all the requisite conditions.

Be that as it may, it must furthermore be conceded, in connection with the appeal to tradition, that no positive proof of the recognition in the earlier Church of seven sacraments, neither less nor more, can be gathered from the writings of the Fathers. An explanation of this silence has been sought in the heretofore widely assumed influence of the so-called *Lex Arcani*, or Discipline of the Secret, whereby the early Christians were, it was claimed, bound to secrecy with regard to their beliefs and mysteries for fear of profanation on the part of the pagans. But apart from the obvious consideration that there could have been no sufficient reason to make a secret of the number seven, especially when we find that things so sacred as Baptism and the Eucharist are currently mentioned, the most competent authorities of the present day, Roman Catholic as well as Protestant, deny the existence of the *Lex Arcani* as a general prohibitive measure. As such it is chiefly a creation of the 17th and 18th century theologians (consult Batiffol, 'Etudes d'Histoire et de Théologie Positive,' Paris, Lecoffre, 1902).* Consequently, others endeavor to explain the silence of antiquity regarding the explicit mention of seven sacraments on the ground that no systematic, synthetic treatment of the subject was attempted by the early writers. Whatever may be the value of this consideration, it is certainly rather strange to find that so late as the 12th century Saint Bernard enumerates no less than 12 sacraments. Roman Catholic theologians, therefore, rely chiefly on the so-called argument of prescription which is formulated as follows: At the time of the Reformation the entire Christian Church, East and West, was in peaceful, undisturbed possession of the doctrine of the seven sacraments. From the fact that then, as now, it was common to both the Greek and Latin communions, is inferred that it must have been held in the Church at a period anterior to the separation of the Greeks in the 9th century. For apart from the antecedent improbability that any doctrinal growth peculiar to the Latin Church would have been adopted by her hostile rival, we do not find, as a matter of fact, that in the various discussions relative to the reunion of the two churches there was ever any difference to be adjusted relative to the number of the sacraments, though matters of seemingly less consequence were often made the object of protracted dispute. A similar line of argument, though less cogent, is pursued with reference to the Oriental sects — Nestorians and Monophysites — who

* For a well meant but quite ineffectual defense of the old view concerning the Discipline of the Secret, consult McDonald, The 'Apostles' Creed.'

separated from the Church in the 5th century. Whence, it is argued: if this doctrine was that of the Christian Church in the 5th century, it cannot be of other than apostolic origin, for the spirit of the early Church was hostile to all doctrinal innovations, as is proved by the history of the great controversies, and she would doubtless have resented any alteration of the original belief in a matter so important and of such a practical character as that referring to the number of the sacraments. It will be noticed that this argument is partly *a priori*, involving the contested assumption, that with regard to the point at issue it was impossible for the Church to have undergone any change of belief.

In the synthesis of theological speculation elaborated by the scholastics, the sacramental system was conceived as an extended application and a consistent carrying out of the great principle embodied in the Incarnation. In this mystery, according to the belief of most Christians, the invisible Godhead, the author of life and grace, was made flesh and dwelt among us, imparting to men through his tangible, human life and ministry that life of the spirit without which salvation is impossible. Hence the idea of conferring and developing the spiritual life through the instrumentality of visible material things ordained to that purpose was recognized as a principle underlying the entire economy of external means of grace in the Church. As regards the seven sacraments the theory is thus systematically worked out in the theology of Thomas Aquinas (1226-74). There is an analogy between the natural and the spiritual life in man. In the natural order man is born; he attains strength and maturity through growth; he is nourished by food; should illness occur he needs medicine; the common good requires the propagation of the race and the supervision of legitimate authority; and, finally, man needs to be prepared for his departure from this world. Now the parallel needs in the spiritual order are provided for through the seven sacraments. Thus, man is born in baptism, strengthened in confirmation, nourished by the Eucharist and cured from illness by penance; the Christian Church is propagated through matrimony, and by holy orders proper guides are provided in things spiritual; and lastly by extreme unction the believer is prepared for his passage into eternity.

While this comparison is ingenious and instructive as a part of a logical coherent system, it cannot, of course, be adduced as a proof that there are precisely seven sacraments, for obviously it was excogitated to fit the case, and had the number of sacraments then admitted been six or eight or more, the analogy would doubtless have been worked out just as satisfactorily. It proves at most that in the 13th century the doctrine of the seven sacraments had been definitely recognized. As regards the effects of the sacraments, it may be remarked that Catholic theology claims for three of them (Baptism, Confirmation and Orders), besides the conferring of grace common to all, the impression upon the soul of an indelible mark or "character." This effect is produced even when through a lack of disposition on the part of the subject no grace is bestowed, whence these three sacraments, when validly administered,

are never repeated. If sometimes in the case of baptized converts, baptism is again administered conditionally, it is only on account of some doubt as to the validity of the rite previously conferred. The proof for the existence of this "character," which Protestants unanimously reject, is based chiefly on the ancient practice of the Church with regard to the non-repetition of these sacraments, and on certain texts from the works of early writers who express more or less vaguely the doctrine formulated later on by the theologians and the Council of Trent.

The views of the early Reformers concerning the mode of efficiency proper to the sacraments were, no less than those concerning their number, a radical departure from the received Catholic doctrine. According to the latter the sacraments produced their effects *ex opere operato*, by which formula is meant, that whenever the rite is properly administered and no obstacle or indisposition exists on the part of the subject, saving grace is imparted to the soul, by virtue of the rite itself as an instrumental cause, and independently of the dispositions of the minister or subject—at least so far as the essential effect is concerned. This mode of efficiency is sometimes expressed by saying that the sacraments contain the grace which they signify. Not that grace can be inherited in the physical symbols, but that through a divine ordinance it is infallibly connected with their administration.

While Protestant authorities are generally agreed in rejecting this doctrine, there is among them much divergence of opinion when it is a question of determining the nature of sacramental causality. Thus according to the Zwinglian and Remonstrant doctrine the sacraments are not properly a means of grace. "They were not ordained to signify, seal and apply to believers the benefits of Christ's Redemption, but simply to be significant emblems of the great truths of the Gospel." The Reformed Church holds the sacraments to be a means whereby grace is conferred, but "their efficacy is due solely to the blessing of Christ and the working of His Spirit, and this efficacy is experienced only by believers." According to the Lutherans the sacraments confer grace in virtue to their own inherent power, but their efficacy resembles that of a sermon; it can act with saving effect only upon believers, and the beneficial efficiency of the rite consists chiefly in animating the faith of the receiver and strengthening his confidence in the divine promises.

To substantiate the *ex opere operato* or direct, independent causality, Roman Catholic theologians adduce certain passages of the New Testament referring to sacramental efficiency, and in which the saving effect is attributed directly to the rite itself as the secondary instrumental cause. Thus in John iii, 5, spiritual regeneration is expressed as a birth of water and the spirit. Similarly Paul asserts that we have been saved "through the washing of regeneration" (Tit. iii, 5), and he admonishes Timothy to stir up the gift of God which is in him through the laying on of hands.

Another argument is based on the very ancient custom of infant baptism, one that was retained by several of the Protestant denominations. If infants are really born again to a

new life by means of the ceremony of baptism, we can scarcely conceive such an effect otherwise than as due to the immediate efficiency of the rite itself. Obviously it is not because the faith of the subject has been stimulated. Neither can the faith of the minister be the efficient cause, since, apart from other reasons, the Church has always maintained the validity of baptism even when conferred by heretics and schismatics—the sacramental rite when properly administered was supposed to possess its own efficiency.

Consistently with this view it has been the constant teaching of the Church ever since the controversy between Pope Stephen and Cyprian in the 3d century, that neither faith nor righteousness is required in the minister of the sacraments for their valid administration. A certain intention, however, is postulated, namely, that of doing what the Church intends to effect by the rite in question. In other words, it is required that the minister intend to perform the rite not in his own name, but implicitly, at least, as a representative of Christ and of the Church. This intention can be extremely vague—in fact, reduced to a minimum—provided the effect intended by the Church be not positively excluded. As is well known, this question of the requisite intention is one of the main points at issue in the controversy concerning the validity of Anglican orders.

Other questions pertaining to the sacraments are of less importance and belong rather to a complete detailed treatment of the subject as found in the ordinary handbook of theology.

SACRED HEART, Brothers of the. See ORDERS, RELIGIOUS.

SACRED HEART, Ladies of the. See ORDERS, RELIGIOUS.

SACRED HEART, League of, or APOSTLESHIP OF PRAYER IN LEAGUE WITH THE SACRED HEART OF JESUS, a pious association whose object, the glory of God and the salvation of souls, is expressed by its motto, "Thy Kingdom Come." The association was founded at Vals, France, on 3 Dec. 1844, the feast of Saint Francis Xavier, by Father Francis Xavier Gautrelet. The director-general of the League is the father-general of the Society of Jesus, and the principal seat or centre of the association is established at Toulouse. There are also diocesan directors and local directors for every centre. Promoters, who assist in extending the work of the

association, are appointed by the local directors. The names and addresses of all the members of the association are kept on record. The number is so great in many centres that the card catalogue system is used. The number of local centres in the world is more than 62,500, and in these centres there are registered over 25,000,000 associates or members. The directors of these local centres are in communication through their diocesan directors and 37 periodicals, called *Messengers of the Sacred Heart*, with the general director. The *Messenger of the Sacred Heart* is published in 22 languages; 6 of the 37 are in English and 6 in Spanish. Other languages in which it is published are German, French, Albanian, Breton, Bohemian, Chinese, Catalanian, Croatian, Flemish, Dutch, Hungarian, Italian, Malabar, Indian, Polish, Portuguese, Slavonic, Hindustani, Arabian and Greek. There are about 5,000,000 members in the United States. In addition to the league periodicals, another most important means of communication is the leaflets distributed each month by the promoters to all the members. The leaflets give the "General Intention" for which all are to pray and work during the month, and supplement the *Messenger* in suggesting ways and means of uniting with the efforts of the missionaries throughout the world for the conversion of souls. Consult 'Handbook of the Apostleship of Prayer'; *Messenger of the Sacred Heart* (New York); Ramière, 'Apostleship of Prayer' (1870).

SACRED HEART OF JESUS, Feast of the, a feast celebrated by the Roman Catholic Church the first Friday after the feast of Corpus Christi. This feast, originated in the latter part of the 17th century, as the special and formal devotion to the Heart of Jesus, owes its origin to Marguerite Marie Alacoque, a French nun of the Visitation Order. Her biographers relate that the Lord Himself appeared to her and gave her instructions regarding the devotion. Many in the Church had practised devotion to the Sacred Heart of Jesus from the time of the Crucifixion, as Cyril, Cyprian, Tertullian, Basil, Ambrose, Saint Francis of Assisi and others, but the devotion was not general nor popularly advocated until the time of Marguerite Marie Alacoque. Consult Gallifet, 'The Adorable Heart of Jesus'; Tickell, 'Life of Blessed Margaret Mary Alacoque'; Nillis, 'De Rationibus Festorum Sacratissimi Cordis Jesu et Purissimi Cordis Mariæ.'

SACRIFICES, originally a religious act, which in primitive ages brought the gods and their worshippers into contact, undergoing various changes in the historical development of nations and religions. It is difficult to define the real nature of sacrifice or give its exact origin, because data from ancient eras are few and vague. One may indulge in more or less curious speculation from our present point of

view, with endless theories of the latter-day anthropologist, according to each critic's predilection, but the practical definite results are limited. It would seem that the more helpless and ignorant early mankind, the more numerous and approachable the deities. In fear at their terrible might,—everything in the heavens and on the earth being attributed to them—heat and cold, storm and calm, sickness and health, riches and poverty, victory and defeat, it was necessary to win their favor and secure their pardon, if the shadows and the burdens were ever to be removed. Hence arose offerings and sacrifices, accompanied by prayers. The differences among these deities and their potency in different places were all-powerful in framing the name of the god, the nature of the sacrifice and the character of the prayer or hymn.

In Babylonia.—The cult and ritual of the Babylonians and Assyrians throughout the periods of their history from about 3000 B.C. to Khammarabi (2250 B.C.) and then from the Assyrian period (2000 B.C.) to the fall of Nineveh (606 B.C.) and from Nabopolassar to the conquest of Cyrus (539 B.C.) including sacrificial offerings in profuse quantities. Their religion, with astral theology as its basis, gave rise to a remarkable system of gods, large and small, each with its assigned position in the pantheon. Popular tradition from primitive ages combined with the speculation of the schools were the streams of influence. Incantations, omens and hymns accompanied the offerings and were embodied in a system that was partly astronomical and dealt with divination through the liver of sacrificial animals, while libation, ritualistic purifications and various symbolical rites were duly employed. Yet the ethical growth was not to be mistaken, as well as the profound influence exerted on the ancient world, Semite, Greek, Roman, as late as the Gnostic, in Prof. Morris Jastrow's opinion. To particularize as to sacrifice, cattle and agricultural products were offered as in Israel, but with other vegetables. For blood sacrifices, lambs, sheep, goats, bullocks and gazelles were included, male as a rule, the sacrifices being boiled or burnt. It was voluntary, chiefly on public occasions and at festivals. Often daily sacrifice was made. The sacrifice in general is to be regarded, in the opinion of Professor Jeremias, as a kind of tribute from "earth to her overlord" to propitiate the deity in its various manifestations, with the thought of expiation as not distant. The Babylonian had no conception of a religious community, so ingrained in Israel; and while similarities with the Babylonian can be traced in the Jewish system the differences were vital. Even Jeremias, with all his gifts of scientific research, with its defects of over-imagination, has to concede this point.

Ancient Egypt.—The vast number of deities in predynastic Egypt and later ages, local, cosmic, minor and demons, arranged at times in triads, mother, father and child, like the Babylonians, amazes the modern inquirer. It is not easy to understand the religion of the old Egyptian, although the sources are many. On the temple inscriptions offerings to the gods of every class and character are very frequent. They are painted on the walls, columns and most parts of the buildings. After the king, priest and soldiers were next in rank; he pre-

sided in the temples and when present had the right to offer sacrifices. This gave special weight to the sacrificial cult. The numerous deities are recognized by different forms or hieroglyphic legends over them. According to Arab historians, it was a primitive custom to sacrifice annually a virgin to secure a plentiful Nile inundation. As a rule in the daily cult slaughtered oxen and geese were in the main sacrifices; burnt offerings were to come later. In the final stages animal worship was revived, with sacrificial rites that aroused the mirth and scorn of contemporary Greek and Latin authors, despite the fact that Egyptian cults found ready lodgment in the great centres of the Roman Empire.

India.—The sacrificial system as practised in ancient India is told with much exactness in the *Brahmanas*,—a Sanscrit term given to a body of prose writings appended to the Vedic text collections. Such detailed explanations were required as sacrifices were more and more elaborated and each ceremonial, however insignificant, had a mystic sense of its own. Here, too, one finds a double current of interpretation, one by the younger and one by the older school of expositors, while the ceremonial manuals give an even more minute description. Sacrifices were of two kinds—meat offerings, consisting of oblations of milk, butter, cereals, or flesh, or of oblations of the juice of the same plant. Three sacrificial fires were set up by each householder; no one national altar existed as in old-time Israel. There were also new and full moon offerings, oblations at the beginning of the three seasons, first fruits, animal sacrifice, day and evening milk offerings. Of a more complex nature were the Soma-sacrifices at important state functions, at which at least three animals were sacrificed and many hecatombs of victims. Each detail has given rise to the most elaborate interpretation, in which the ritualistic theologians delighted, but which here need not be further enlarged upon. In post-Vedic times, with distinct changes in religious beliefs and the rise of new sects, animal sacrifices gradually declined, almost entirely to disappear. Among the Saktas, whose chief seat of worship to-day is Bengal, Assam and Behar, animal sacrifices, usually one or more kinds, continue, the flesh being cooked and served to guests at the ceremony. Some adherents use cocoanuts or pumpkins instead of animals.

Greek and Roman.—The material for describing sacrifices among the Greeks and Romans is very meagre, in the absence of the elaborate codes which have been preserved by other races. In their literature the heroes are treated like gods and the gods like heroes, with a familiarity which is typical. In the Hellenic world numerous were the deities, the degree of veneration varying, however, with the locality. The gods immigrated as their votaries wandered, although the inherited ritual, methods of propitiation and the name of the god would be continued, even if subjected to change. In the Eleusinian mysteries, for example, the gods were actors performing certain rites—the Homeric hymn to Demeter which celebrates the cult dates from the close of the 7th century B.C., if not earlier. On the third day sacrifices, comprising the mullet fish and barley cakes, were offered with special rites.

In the lack of a priestly caste, a sacrificial system was not nationalized. The legendary sacrifice of Agamemnon's daughter, Iphigenia, a favorite in literature, to appease the offended Artemis, only illustrates the barbarism of the primitive cult before it had been modified by the Hellenic spirit. According to the Spartans the human sacrifices originally offered to the goddess were abolished by Lycurgus, who substituted the flogging of youths. The Athenians used to practise human sacrifice at periods of national calamity, selecting for that purpose two from a number of criminals only kept for such a contingency, one for the men of the city and one for its women, who were both stoned to death outside the town to avert all danger. The Romans, always open to foreign religious influence, now the Etruscan, now the Greek, now the Egyptian, brought the conquered gods to Rome when they destroyed the cities of the enemy. In its earliest period when Fetichism developed into Animism, ritual played a great part in the Roman religion, and exactness was necessary in the character of the offerings—male victims to male deities, and female to female divinities, white to the gods above, black to the gods below. Special gods demanded special sacrifices, but mere rustic deities were given milk and millet cake, not blood offerings. In later ages when Rome was transformed into a spacious empire religious cults were many and human sacrifices grew. In the Saturnalia at Rome a human victim was slain annually, until the practice of human sacrifice was wholly interdicted by Theodosius toward the end of the 4th century.

In the Old Testament.—The sacrificial system as laid down in the book of Leviticus has aroused considerable inquiry and criticism. It has been assumed that the entire plan was adapted by the law-giver, at the divine command, to the character and condition of the Israelites, just emancipated from Egyptian serfdom, that it was a concession to their state of civilization at an era when cotemporary nations employed sacrifices as the expression of their sense of religion. But long before the Exodus data as to sacrifices abound in the Pentateuch. They are mentioned in connection with Cain and Abel, with Noah after the Flood, frequently with the Patriarchs. The offerings were vegetable or bloodless and animal or blood-giving, and in one instance Abraham's faith was tested when the command came to sacrifice his son. In those early ages, too, the altar was of earth or of unhewn stones and could be placed anywhere. Hence it was no sudden or startling innovation when Moses developed sacrifices, which in Egypt had been restricted to the paschal lamb, into a national religious system. The reform consisted in the limitation of sacrifice to a special place and to a special group of sacerdotal agents. According to the law the legal place for the offerings was "before the door of the tabernacle" (Ex. xi, 6), before Yhwh (Lev. iii, 1, 7, 12; ix, 2, 4, 5) and afterward in the Jerusalem Temple. The Biblical records disclose many violations of this law, which aroused the earnest rebukes of the prophets. Shiloh, Shechem, Mizpah, Gilgal, Hebron, Beer-Sheba, Beth El witnessed popular assemblies and sacrifices. Besides private sacrifices in individual homes, Solomon, not a priest,

offered oblations while kings, priests and a class of prophets disobeyed the law's injunctions and offered to foreign idols, not disdaining human victims. Nor did the genuine national prophets—men of the type of Isaiah, Micah, Amos—show enthusiasm for the sacerdotal worship so readily abused by the people and their leader. On the other hand, passages occur in the Psalms and prophets that allude to the reinstitution of the sacrifices which form so large a portion in Ezekiel's forecast (Ezek. xl-xlviii). It can thus be seen how difficult the subject from the historical point of view. Many theories have arisen in consequence, which fail to satisfy. The Mosaic system of sacrifice, as set forth largely in Leviticus, is clearly narrated. Divided into bloodless and blood-giving offerings, so far as their nature, vegetable or animal, is concerned, they are further classified, according to the occasion and the worshipper's feelings, into burnt-offerings, thank or praise offerings, sin or trespass, purifying offerings. They also could be regarded as voluntary or free-will, compulsory or obligatory offerings. Animal offerings were usually accompanied by libation of wine and a drink offering. While the sacrificial animals demanded were of the clean class, in the data some of the animals specified were not of that type, as bullock, ox, cow, calf, sheep, lamb, goat and kid were alike included. Fishes were wholly excluded: fowls, turtle doves and pigeons were acceptable under certain conditions, for example, from the poorer people. As for the bloodless sacrifice, these included flour, wine, oil, with frankincense and salt as additions; rarely honey and leaven were used. Animals to be sacrificed were to be perfect—mostly a male was required, none were to be less than seven days old, first born males to be killed within the first year, mothers and young not to be slain on the same day, some offerings to be more than a year old, the animal, too, was at times one that had done no work nor borne any yoke. First fruits offering of corn was to be of the finest quality. Before sacrifice "sanctification" was necessary, through cleansing of the worshipper. As the blood represented the life or soul, the priest took special care to receive it and sprinkle it "round about on the altar" or on its parts. Certain oblations were eaten by the priests alone in the sanctuary's court; others by the priests and their families in any "clean" place; while the Israelite who offered had to eat his share, within an appointed and limited time, with his family and guests in the city where the sanctuary stood. This completes, without further particularizing, a summary of the Mosaic sacrificial system, whose ethical purpose was, as is proved by the Hebrew word for sacrifice, *Korban*, from the root "to bring near," to bring the worshipper or offerer in closer communication with the Almighty, the oblation or sacrifice evidencing his readiness to some loss and to show his sense of gratitude or penitence.

Rabbinical View.—With the final destruction of the temple and the passing away of the national sacrificial system, the early rabbis in their utterances emphasized the ethical spirit at the basis of the old order and told how the substitute for altar and offering was close at hand in the individual's daily life and character.

In this respect their view was that of the great national prophet leaders of Israel centuries before as well as that of the law itself. It must not be forgotten, also, that sins which concern persons and can be grouped largely under the heading of moral law "could not be atoned without proper restitutions," as Schechter notes in his 'Rabbinic Theology' (p. 196). The leading rabbinic authors unite in similar assertions. Maimonides, the most prominent rabbi of the Middle Ages, in his famous 'More Nebuchim,' shows how even sacrifices in their very nature were secondary as was declared repeatedly by the chief prophets, who laid more weight on inner than outward worship. The formalism of the law had its useful purpose but it was to be subordinated to character and good deeds. Prayer became equivalent to sacrifice. Even if the maimed and defective were rejected at the altar, the broken-hearted are accepted by God. The altar of the home is equal to the altar of sacrifice. "Dead bodies do not render unclean, nor does water make clean; it is the life that gives the real answer to the cry of religion" — was the declaration in effect of Johanan ben Zakkai, in the era of reconstruction after the fall of Jerusalem. The entire trend of rabbinic thought to our day, with but few exceptions, in many an apt statement, anecdote or decision stresses the subordinate character of ritual sacrifices, which were a concession to their age, to pass away as the people grew in spiritual power, although the loss of national independence had to occur to instill the needed lesson.

The Germanic Tribes.—Sacrifices formed a central institution among the early Germans and offerings varied from a gift of milk or flesh or grain carried out to a grove or set in the house corners to human sacrifices. After harvest certain animals were slain and a great feast was celebrated, while the priest swept out the temple precincts with the sacred broom, being careful not to breathe, while within, running outside to draw a fresh breath. Prayers were recited for a bountiful crop, as a great cake was laid upon the altar. In family worship, offerings of milk, honey, fruit and flowers were made. Blood was "the savor and charm" of sacrifice which was conducted with much pomp. It was caught in vessels or in a pit as the victim was led thrice about the altar and killed by the altar stone, amid festal song, and was sprinkled over the sacred trees, altar and walls of the holy place. Entrails, heart, liver and lungs were devoted to the gods — the rest was devoured by the people. The favorite animal for sacrifice was the horse; ox, boar, ram and cock, all males, were also accepted, white animals being preferred, but black were also chosen. Human sacrifice, too, was not disdained. The chain of evidence reaches from Tacitus to the borders of the Middle Ages. "In old Scandinavian legend," according to Gummere, "the old ferocity lingered longest." Captives, criminals or slaves furnished victims for the sacrificial altar, as illustrated by the Viking practice to redder the keel, at the launching of the new ship, by the victim's blood. The marked love of human sacrifice is proved by the Cimbrians in Italy, the wholesale sacrifices among battling German tribes and the emphatic testimony of

Tacitus in his 'Germania.' Gummere relates ('Germanic Origins,' p. 464) that in 1843 when a new bridge was to be built at Halle, the people vainly insisted that a child should be walled into it to insure good luck.

In Other Lands.—How the Gauls favored human sacrifice is shown by Julius Cæsar who writes "heaped mounds" would be met in Gaul, which were places of sacrifice. A huge image in the form of a man or a deity would be erected all hollow within, into which human victims would enter and then be set on fire. In Africa in the last century a king of Ashanti, wishing to secure the favor of the gods for his palace, had 200 girls put to death and their blood mixed with the mortar for the new edifice. In Mexico where human sacrifices were very common the rain god was propitiated by the sacrifice of children and to ensure a good harvest men and children were sacrificed to the spirit of corn. A certain mimicry of sacrifice is illustrated by the Mexican offering of a puppet of dough in the form of a man, while the maiden sacrifice to the Nile was an image of mud formed on the banks of the river. Not many years ago hundreds of human victims were offered on the west coast of Africa, where various forms of sacrifice existed. Among the American Indians sacrifices were not so common — the Pawnees and the Iroquois were addicted to such practices. Some curious resemblances to the Mosaic sacrificial systems have been found in the religious customs of the Aztecs and Latin-American races in general.

Kinds of Sacrifice.—A number of recent scholars, taking the initiative from Robertson Smith and Wellhausen, trace sacrifice to primitive forms of religion, connected closely with totemism, although it is difficult to derive what appears to be a universal tendency from so narrow an origin. In the evolution of sacrifice, they distinguish various kinds, for instance, the communal, where a festal meal is shared in common by the god and the worshipper; the honorific, which consists of gifts and libations in honor of the god as if he were an earthly ruler; the piacular, when with consciousness of having done wrong and having brought upon oneself some stain or reproach, an offering is made to atone for the wrong or to cleanse from the impurity, as if the gods were estranged and angry; the mortuary, where, after a death, offerings, especially of human beings, are made as guides or companions in the other world, or as furnishing strength to the dead by the blood of the victim; human, as in primitive cults when human victims are offered to rivers, in the redemption of the first born and as proved by the early law of blood revenge. Such theories, however, are hardly held as convincingly as a few decades ago. The scattered evidence in their favor is not always trustworthy and may be at times susceptible of other meanings.

ABRAM S. ISAACS,
Professor of Semitic Languages, New York University.

SACRILEGE, the act of violating or profaning any sacred thing or any place that has been dedicated to the service of God, as a church or a chapel; in popular usage it means breaking into a place of worship and stealing therefrom. Another meaning of sacrilege is the alienating to laymen or to common uses, of what has been dedicated, appropriated or consecrated to religious persons or purposes. As thus understood, sacrilege is an offense triable by ecclesiastical courts. In the Roman law robbery of churches was, under the Justinian Code, punishable with death. It was formerly a capital crime in English common law also, but by the statutes 24 and 25 Victoria burglary of churches is treated simply as burglary, and theft of sacred things from sacred places as larceny. Neither in the statutes of the United States nor in those of any of the individual States of the Union is sacrilege treated as a crime in any way different from common burglary or larceny. Consult Spellman, 'The History and Fate of Sacrilege.'

SACRISTAN, the original of the name "sexton," which is an abbreviation of sacristan, the former title being still retained in some churches. The sacristan is an officer in a church whose duty it is to take care of the church and all belonging to it, the sacred vestments and utensils, etc., and to prepare whatever may be required for the sacred offices.

SACRISTY, in the ancient Church a building attached to the basilica and consisting of three parts: (1) The reception-room, in which the bishop was received by the clergy and also gave audiences. It was in this room at Milan that the Emperor Theodosius asked absolution of Saint Ambrose. (2) The sacristy proper in which the sacred vessels and vestments were kept for immediate use; here the officiating ministers robed themselves for divine service. (3) The chamber in which office books, vestments and church plate not in present use were kept. In many modern churches the sacristy is called the vestry, and consists of but one room.

SACROBOSCO, säk-rō-bōs'kō, Johannes de (John of Holybush, Holywood, or Halifax), English mathematician and astronomer: b. Halifax, Yorkshire; d. Paris, 1256. He entered the University of Paris in 1221, afterward becoming a professor there. His most celebrated work is a treatise, 'De Sphæra Mundi,' a paraphrase of a portion of the Almagest (q.v.), of Ptolemy (q.v.). It was printed in 1472, and was afterward frequently reprinted, with the additions of able mathematicians. He was also the author of a treatise, 'De Anni Ratione, seu

de Computo Ecclesiastico'; a work on arithmetic, bearing the title 'De Algorismo,' which is one of the earliest treatises on the subject in which the Arabic numerals are used. It was printed at Paris in 1498, with the 'Commentary of Petrus Cirvillus.'

SACRUM, the sacred bone (*os sacrum*), a compound triangular bone situated at the lower part of the vertical column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. In man it consists of several vertebræ with their bodies and processes consolidated into a single bone. Its anterior surface is concave from above downward and from side to side. The posterior surface is convex, and presents in the middle vertical line a crest, formed by the fusion of the spines of the vertebræ, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected. In the female the sacrum is broader than in the male. The sacrum of man differs from that of the lower animals by its greater breadth in comparison with its length. See ANATOMY; OSTEOLOGY; PELVIS; SPINE.

SACY, sā-sē, Antoine Isaac, BARON SILVESTRE DE, French Orientalist: b. Paris, 21 Sept. 1758; d. there, 21 Feb. 1838. Obtaining a thorough acquaintance with the Greek and Latin classics, he studied Hebrew, Syriac, Chaldean, Samaritan, and then Arabic and Ethiopic. To these he added a knowledge of the principal European languages, including Turkish. Later he mastered Persian. During the Revolution he withdrew to a short distance from Paris, and lived unmolested, though his attachment to monarchy was well known. In 1795, when the Convention established a school of Oriental languages, De Sacy was appointed professor of Arabic, and was allowed to retain this situation notwithstanding his refusal to take the oath to the new Constitution. Bonaparte made him professor of Persian in the College of France (1806), and afterward bestowed upon him the title of baron (1813). In 1808 he was elected by the department of the Seine into the legislative body; but took no part in the debates till 1814, when he voted for Napoleon's deposition. In 1815 he was appointed rector of the University of Paris, and shortly after member of the commission for public education. While officiating in these capacities he formed around him a circle of scholars, by which he became indirectly the teacher of all Europe. He took a prominent part in founding (1822) the Asiatic Society of Paris, of which he was president; and it was by his recommendation that professorship of Chinese, Sanskrit, Manchu and Hindustani were established in the capital. In 1832 Louis Philippe raised him to the peerage and made him, after Remusat's death, which took place in this year, conservator of the Oriental manuscripts in the royal library. Among his works may be mentioned 'Principes de grammaire générale' (1799); 'Grammaire Arabe' (1810), and 'Chrestomathie Arabe' (1806); 'Exposé de la religion des Druses' (1838); 'Calila et Dimma' (1816).

SADDLE, a seat for a horse's back, contrived for the safety and comfort of the rider. In early ages the rider sat on the bare back of

his horse, but in course of time some kind of covering was placed over the back of the animal. The modern riding saddle consists of the tree, generally of beech, the seat, the skirts and the flaps, of tanned pig's skin, and the construction and weight vary according to the purposes for which it is to be used. Among the varieties are racing saddles, military saddles, hunting saddles and side saddles for ladies. The name saddle is also given to a part of the harness of an animal yoked to a vehicle, being generally a padded structure by means of which the shafts are directly or indirectly supported. It is further applied to the support of a rod in machinery or of a spar of a ship.

SADDLE MOUNTAIN, Mass., the chief group of the Taconic Mountains, in the northern part of Berkshire County, four miles southeast of North Adams, and containing Greylock Mountain, the highest peak in the State, 3,535 feet in altitude.

SADDLE REEFS. During the process of folding an anticline the beds at the crest or apex of the fold sometimes tend to open or separate just as a pack of cards might do when bent sharply. If these openings become filled with mineral matter they form a special type of veins which are known as saddle reefs because of their saddle shape. Certain veins of the Nova Scotia gold field and of the Bendigo gold field in Australia are of this type.

SADDLEROCK OYSTER, a large and favorite kind of oyster originally obtained from a reef known as Saddle Rock near Norwalk Harbor, Connecticut. The supply was exhausted early in the last century, but in the first attempts at artificial cultivation of oysters (q.v.) in the eastern part of Long Island Sound many small "seed-oysters" were derived from that district, and so the name continued until it became a market term about New York for large and well-shaped oysters mostly sold to be eaten raw.

SADDUCEES, a sect or party of the Jews during the last three centuries preceding the fall of Jerusalem and the end of the old Jewish state (70 A.D.). The history of the party and the facts as to its constituency, beliefs and practices are only imperfectly known. The statements in Josephus and the New Testament, our most important evidence, are not altogether satisfactory. The New Testament writers may have been indirectly influenced by Pharisaic prejudice, while Josephus, writing to please and interest Greek and Roman readers, limits himself to a few somewhat general and not altogether consistent observations. In the New Testament the Sadducees are linked with the Pharisees as opponents of Jesus (Matt. xvi, 1, 6, 11, 12, etc.); they are said to have denied the resurrection of the body (Matt. xxii, 23ff and parallels), also the existence of angels or spirits (Acts xxiii, 8). As influential priests and members of the Sanhedrin the Sadducees officially opposed the early preaching of the Apostles (Acts iv, 1; v, 17). They sat side by side with Pharisees in the Sanhedrin or Supreme Council of Judaism (Acts xxiii, 6ff), although the two parties were hostile to each other.

Josephus ('War,' ii, 8, 14; 'Ant,' xiii, 5, 9; 10, 5f; xvii, 2, 4; xviii, 1, 2f; xx, 9, 1) tells us that the Sadducees did not believe in

fate (i.e., Providence) nor in the immortality of the soul. They emphasized human free will and responsibility and were more austere and inclined to severity in judgment than were the Pharisees. They rejected tradition and held the written law alone to be authoritative. They belonged mainly to the more wealthy and aristocratic circles and were not influential with the mass of the people. Josephus, doubtless, knew more about the Sadducees than he set down in his writings. It must be remembered that the evidence of both Josephus and the New Testament holds good mainly for only the very last period of Jewish history when these Sadducees were only a shattered remnant of a once great and powerful party. There is no trace of any distinct parties in post-exilic Judaism until about 180 B.C. when the close contact with Hellenism consequent on the Seleucid supremacy over Palestine, led to an ardent Hellenizing propaganda and consequently to a cleavage of the Jewish community into two factions, the conservative and the radical or Hellenistic. But it is a mistake to identify the Sadducees with the latter, who were willing to sacrifice even the law itself in favor of conformity to Greek ideas and practices. The conservatives stood for steadfast loyalty to the law and Jewish customs and prejudices. But within the conservative ranks—which comprised the majority of the people—two tendencies were operative. Some, with loyal acceptance of the law and reverence for it as the supreme religious authority, were content with the Law as written. They opposed an accumulation of traditional interpretation as authoritative. Dogmas not explicitly taught in the Law might be refused assent. On the other hand were those who sought to make the Law ever more comprehensive and universally applicable through exegesis or interpretation. Such interpretations became an ever-enlarging body of *tradition* as binding as the Law itself. This was the party of the *Scribes*—ardent students of the Law—while the other tendency was mainly represented by the priests and aristocracy. The scribal position was essentially that Israel was fundamentally a *church*—a religious organization; the opposite position allowed full room for the conception of Israel as a political entity—a nation among the nations of the world. In the reorganization of the Jewish state under the Asmonean priest-princes (142–63 B.C.), the party of the scribes became definitely organized as the Pharisees. The group or party opposed to the Pharisees were known as the Sadducees, probably because so many of the Zadokites (i.e., the priestly aristocracy, cf. Ezek. xlv, 15f.) were among its influential members. There is no evidence, however, that these were so strictly organized as was the case with the Pharisees (q.v.). In general, the Asmonean rulers were inclined to favor the Sadducees. The Pharisees thus became the party of opposition.

The non-priestly aristocracy also generally sided with the government, that is, were counted as Sadducees. The numbers of this generally patriotic, conservative party were sadly diminished in the civil strife preceding the Roman occupation (63 B.C.) and in the wars between Herod and Antigonus, the last Asmonean prince. Its representation in the Sanhedrin was reduced and its hold on the people greatly dimin-

ished. In Herod's later years the party seems to have bettered its condition but it never again recovered its earlier power and influence. As a party it ceased to exist with the fall of Jerusalem, 70 A.D., and the complete disorganization of Judaism that ensued. The view advocated above is somewhat different from the traditional one which takes the Sadducees to have been, as a party, somewhat irreligious, inclined to Hellenism, worldly and with little reverence for the Law and sacred things in general. That some Sadducees were such is probably true, but it certainly is not correct to so characterize the party as a whole.

The Sadduciac type of thought is represented in Jewish literature by such works as Ecclesiastes in the Old Testament, by Ecclesiasticus and 1 Maccabees in the Apocrypha, and possibly by the Testaments of the XII Patriarchs and the Book of Jubilees in the Pseudepigrapha. A most interesting Sadduciac work, hitherto unknown to modern scholars, was recently discovered in the Cairo genizah by Dr. S. Schechter and published by him (Oxford 1910) under the title 'Fragments of a Zadokite Work.' In this we have evidence of the existence of a reform party or sect within the Zadokite circle which originated about 200 B.C. and was still in existence, hoping for better things, as late as near the beginning of the Christian era, the date of the fragment.

EDWARD E. NOURSE,
Professor of Biblical Theology, Hartford Theological Seminary.

SADE, Donatien Alphonse François, COUNT, popularly called the MARQUIS DE SADE, French libertine and novelist: b. Paris, 2 June 1740; d. Charenton, 2 Dec. 1814. From the age of 14 to 26 he was in active military service until his return to Paris in 1766 when his immoral life became notorious. At Aix in 1772 he received the penalty of death for an unnatural crime and for poisoning, but escaped to Italy. Returning to Paris in 1777, he was re-arrested and jailed in Aix, but again escaped only to be recaptured and finally committed to the Bastille where he killed time by writing lewd novels and plays. These include 'Justine' (1791); 'Juliette' (1792); 'Philosophie dans le boudoir' (1793) and 'Les Crimes de l'amour' (1800). He had the temerity in 1803 to address a copy of 'Juliette' to Napoleon and was committed to the Charenton Lunatic Asylum where he had spent some time in 1789-90, and there he died. "Sadism," the diseased condition of sexual perversion with cruelty, is named after him.

SADHS, sâds, or **SAADHS**, sâ'âds, a Hindu sect which believes in one God, and teaches a pure morality. The sect was founded in 1658 A.D. by a man called Birbhan. They

have no temples, but assemble at stated periods in houses, or courts adjoining them. They are found chiefly in Farukhabad, Delhi, Mirzapore, etc.

SADI, sâ-dê', or **SAADI** (MOSLEHEDIN SHIRAZI), Persian poet; b. Shiraz, about 1194; d. there, 1291 or 1292. After completing his studies and spending many years in travel, he settled in the neighborhood of Shiraz, where he enjoyed the favor of several Persian rulers. The Persians esteemed him exceedingly on account of his golden maxims, which they consider a treasure of true wisdom, and also on account of his pure, simple and elegant style. His works comprise (1) a collection (Divan) of lyric poems in the Arabic and Persian languages; (2) 'Gulistan' ('Garden of Roses'), a didactic work composed both of prose and verse, in eight books; (3) a work in verse, called 'Bustan' ('The Orchard'), containing a collection of histories, fables and moral instructions. The complete works of Sadi were published in Persian at Calcutta (1791-95). Graf has published translations from the 'Divan' in 'Zeitschrift der morgenländischen Gesellschaft,' and there is a German translation of the political poems by Rückert (with life of Sadi, 1894). There are editions of the 'Gulistan' by Sprenger (1851) and others, and among English translations are those by Eastwick (1880) and Ross (1823). The 'Bustan' has been edited by Graf (1858) and Rogers (1891), and translated into English by Davies (1883), and in part by Sir Edwin Arnold 'With Saadi in the Garden,' (1888). Consult Ouseley, 'Biographical Notices of Persian Poets' (1846).

SADI-CARNOT, sâ-dê kâr-nô. See **CARNOT**.

SADLER, sâd'lér, Anna Teresa, Canadian writer: b. Montreal, Quebec, 1856. She has written much for the Roman Catholic press, and her published books include 'Ethel Hamilton, and Other Tales' (1877); 'The King's Page' (1877); 'Seven Years and Mair' (1878); 'Women of Catholicity' (1885); 'The Silent Woman of Aloud' (1887); 'Gems of Catholic Thought,' a compilation (1882), etc.

SADLER, or **SADLEIR**, Sir Ralph, English diplomatist: b. Hackney, 1507; d. Standon, Hertfordshire, 30 March 1587. He became the ward of Thomas Cromwell, was one of Henry VIII's principal secretaries of state and was appointed by Henry's will one of the council to assist the executors upon whom was laid the government of the country and the guardianship of young Edward VI. He went into retirement during Mary's reign, but emerged after the accession of Elizabeth, and became one of Cecil's agents, especially charged with negotiating Scottish affairs. In 1568 he became chancellor of the duchy of Lancaster and thereafter he was mainly occupied as one of the English commissioners to treat of matters relating to the queen of Scots. In 1580 he was for a time one of her guardians at Sheffield and Wingfield. His last mission was to James VI of Scotland in 1587 to endeavor to reconcile him to the execution of his mother. Consult Sadler's State Papers, with memoir and historical notes by Sir Walter Scott (1809).

SADLER, Reinhold, American legislator: b. Prussia, 10 Jan. 1848. He came to the United

States when young, and has been for many years a resident of Nevada. He was elected lieutenant-governor of Nevada in 1895, and on the death of Governor Jones in 1896 became governor. He was regularly elected to the office in 1898, which he occupied until 1903.

SADLER, Mary Anne (Madden), Canadian author: b. Cootehill, County Cavan, Ireland, 21 Dec. 1820; d. 1903. She early contributed to London magazines, and in 1844 emigrated to Canada, where she settled in Montreal and in 1846 was married to James Sadler. She was for many years editorially connected with the Roman Catholic press, and also translated religious and other works from the French. Author of 'Alice Riordan' (1851); 'The Confederate Chieftains, a Tale of the Irish Rebellion of 1641' (1859); 'Purgatory, Doctrinal, Historical and Political' (1886), etc.

SADO, sā'dō, Japan, an island off the west coast of Hondo, opposite and 32 miles from Nūgata, with an area of 336 square miles, and a coast line of 135 miles. It has a diversified surface culminating in Kimpokuzan, 3,820 feet high. South of Kimpokuzan is the town of Aikawa, near the east coast, with the ancient and still productive gold and silver mines in its vicinity, to which Sado owes its celebrity. On the west coast 18 miles distant from Aikawa is Ebisuminato, the port of the island. Pop. of island about 120,000.

SADOLETO, sā-dō-lā'tō, Jacopo, Italian theologian: b. Modena, 1477; d. Rome, 18 Oct. 1547. He was consecrated bishop of Carpentras, near Avignon, in 1517; belonged to the Contarini Reform party, and was a member of the commission appointed by Paul III to take steps toward effecting a Church reformation. He immediately opened a correspondence with Erasmus, Bucer, Sturm and Melancthon, but when in 1539 he invited the Genevans to return to the Roman Catholic Church, he received a harsh rebuff from Calvin. After that he confined himself largely to his own diocese. He had been appointed cardinal in 1536, but while he was frequently summoned to Rome he preferred Carpentras, and his study, well-stocked with books of the new learning, in which he was an adept, being one of the Latinists of his day. He wrote commentaries on the Psalms, and on the Epistles of Saint Paul, and so excellent was their style that Erasmus made the somewhat invidious remark that "their very polish of expression will take off the edge of their pious suggestiveness." His works were published in four volumes in 1734. He was a diplomat in whom successive popes had confidence and acted as ambassador to Francis I in the interests of peace in 1544. Consult Joly, 'Etude sur J. Sadolet' (1856).

SADOWA, sā'dō-vā (Czech *Sádová*), Czech-Slovakia, a village near Königgrätz, on the Bistritz, remarkable as one of the hotly contested Prussian positions in the decisive battle of 3 July 1866, in which the Crown Prince of Prussia and Prince Frederick Charles commanding the Prussians defeated the Austrian forces under Benedek. This battle is known also as the battle of Königgrätz.

SADTLER, sat'ler, Samuel Phillip, American chemist: b. Pine Grove, Pa., 18 July 1847. He was graduated at Lehigh University in 1867.

and later studied at the universities of Berlin and Göttingen. He was professor of natural science at Pennsylvania College in 1871-74; assistant professor of chemistry at the University of Pennsylvania in 1874-86, and professor there in 1887-91. He was professor of chemistry at the Philadelphia College of Pharmacy in 1878-1916; and since 1891 has been a consulting chemical expert at Philadelphia. He was chemical editor of the 'United States Dispensatory' (15th to 19th editions); and from 1900 was a member of the committee of revision of the 'United States Pharmacopœia.' Author of 'Hand Book of Chemical Experimentation' (1877); 'Industrial Organic Chemistry' (1891); and joint author of 'Pharmaceutical Chemistry' (1895; 5th ed., 1917).

SÆMUND, sā'moond, Sigfússon, THE WISE, Icelandic scholar: b. Iceland, about 1056; d. Oddi, 1133. He undertook a course of foreign travel in pursuit of learning, and visited Paris and Rome; then, returning to Iceland, he became a priest at Oddi (1176). He was unknown to scholars till about 1643, when the newly-discovered 'Elder Edda' and other writings were falsely ascribed to him.

SAFE, a strong and substantial receptacle for money, important papers and valuables, usually of iron or steel, or of both combined; sometimes with a filling of concrete to resist heat. A safe, to justify its name, should be proof against fire, explosives, acids, drills, wedges and the other implements and opening devices resorted to by burglars. The great majority of safes are designed mainly to preserve the contents from fire and to resist sneak-thieves. But the larger and most costly safes are built to safeguard the cash and securities of banks, trust companies, etc. The history of the progress of these strong safes is mainly a record of struggles between the burglar and the safe-manufacturer; the result is, that safes can now be obtained which are all but impregnable. With the modern safe of the best kind the lock may be said to be the only vulnerable point; hence much care and ingenuity have been expended on its mechanism. Numerous patents, mostly of American origin, have been introduced in recent years. Of these, the keyless permutation locks deserve particular mention, as they obviate the danger which arises from lost or false keys. Such locks allow of opening only after an indicator has been moved in accordance with a certain combination of numbers arranged before closing the safe. Some safe-locks are so constructed that to be freed they require different keys on different days, some can only be opened at a certain hour, this being fixed on before the door is closed; while others again require two or more keys in charge of different persons; in fact, the arrangement contrived to render the plundering of safes next to impossible are too numerous even to mention. The connection of safes with electric alarms in a variety of ways forms another safeguard. See VAULT.

SAFE-CONDUCT, a security granted by the sovereign authority, or persons delegated by it, to strangers or other persons to enable them to repair to and return from a certain place undisturbed. In most of these cases passports have now taken the place of special safe-conducts. Sometimes the safe-conduct is given to

persons accused, to secure them against harm when summoned to an examination.

SAFE INDUSTRY IN AMERICA. Various methods for the safe-keeping of treasure, jewels and other valuables have been in use since the earliest periods in history, and the advancement in this line has necessarily kept pace with increased wealth. Thus we have witnessed the evolution from the old-fashioned strong-box to the massive chilled-iron and steel vaults, absolutely fire-proof and burglar-proof, till they have reached the highest degree of efficiency and perfection that science and skill can make them. Locks of rude construction were in use by the ancient Egyptians, and during the Middle Ages by the Romans. The Chinese also used a lock similar in construction to the famous Bramah lock, invented in England in 1784. These were made of wood, the tumblers being of different length to fit the sizes of the wards in the keys. Beginning with the Middle Ages the inventive genius of man was turned toward providing something more substantial than a lock as a method of warding off the burglar, who at that time had not attained to the remarkable skill and cunning of the modern "cracksman," and indeed the professional thief of modern times would look back with envy on his predecessor who had nothing more than a mere wooden box, sometimes bound with iron, with which to cope. The first means of securing valuables was by placing them in some secret cavity in a wall, the door of which was opened by a spring or other device, but more often articles of household furniture were used, such as desks with secret drawers, or tables and chairs with false bottoms. These constituted the chests of the wealthy for some time and some of them were furnished with locks and bound with strips of iron, the whole very artistically made so as to ward off suspicion of their contents. The oaken-chest or strong-box, reinforced with iron bands and knees, was in the beginning of the 18th century considered to be the best means of security. Such a chest was used in 1707 to guard the crown jewels of Scotland.

Prior to the 19th century the all-metal safe was unknown. The first improvement along this line was made in France about 1820, consisting of a metal box built within double walls, the space between being filled with a composition of non-conducting substances. A little later a so-called fire-proof safe was constructed in New England, considered to be a vast improvement over the existing types. This safe had a body of solid oak plank from three to four inches thick, which, after being thoroughly saturated with alkali, was covered with sheets of thin iron. To make this more surely fire-proof, bands of iron were crossed and recrossed over these plates and nailed down with large round-headed iron spikes. The great fire in New York in 1835 proved the worthlessness of these, several hundred of them being then destroyed. The idea of filling in the walls of a safe with non-conducting substances was first put into use in this country in 1843 by Daniel Fitzgerald. His idea was to fill the metal walls of the safe with plaster of paris because of its tendency to throw off heat, and having secured a patent on his invention he immediately began to manufacture a safe known as the "Sala-

mander." His patent was later assigned to B. J. Wildey, who made a safe called "Wildey's Patent," the principle of these being to leave the space between the walls empty, trusting that the contents of the inner portion of the safe would be protected from heat by the non-conducting properties of the air. Other mixtures, such as asbestos, mixed with plaster of paris, clay, alum, fire-clay, mica, chalk, etc., were then used to fill the vacant space, but none of these proved absolutely satisfactory. To-day the modern safe walls are filled either with alum or some other salt, which when heated gives off a quantity of water. Various water-chamber devices have also been employed, with a view to maintaining a body of steam between the inner and outer shells of the safe when exposed to a hot fire.

Outside of the fire element, the most important part of the safe to be considered is the lock, for with our modern methods of fire protection the danger of burglary is often as great as possible loss by fire. The first supposedly non-pickable lock was the Bramah, but was finally proved to be valueless and easily picked, this being done by a Mr. Hobbs, by the "tentative process." Three other locks then came into use, the Chubb, also picked by Mr. Hobbs, the Pye lock, invented in 1851, but picked by Linus Yale, Jr., of Philadelphia, by the "impression process," and the Yale lock. Since then many new forms of locks have been invented, and the modern lock-combinations are constructed in a manner which has made the trade of burglary extremely difficult.

There are three ways of procuring security against burglary, first by the laminated construction; second, by the use of blocks of chilled iron, this method being more useful in the construction of large vaults than in the making of portable safes; and third, by the spherical chilled-iron safe. In the first method of construction the chamber is made of alternate layers of hard and soft plates of iron and of plates of hardened steel, the two laid alternately over each other in the walls of the chamber in such a way that they form a single mass. Thus the body of the safe, being constructed of alternate plates of iron, welded iron and steel, carbonized and decarbonized steel, and crystal steel, fastened together by means of bolts from the inside, has made safes practically impregnable to drills, jimmies, jackscrews and other devices. Another method of making safes, in common use by manufacturers, is to roll down together while hot into one solid sheet of tempered steel three layers of soft iron or steel alternated with two intermediate layers of hard steel. These composite sheets, when they have been rolled till about one-half of an inch thick, are then built into the walls of the safe and alternated with plates of heavy steel about one-half inch thick. The doors are generally the weak point in the construction of a safe, for it is these which a burglar first attacks to see if there is any crevice into which a wedge might be inserted, or any crack into which nitro-glycerine or any other high explosive might be introduced. In some safes the plates comprising the door are dovetailed, engaging with the corresponding parts of the jamb; in some an air-tight packing is used between the jambs and their abutments; while in others a screw door is used.

One solid mass of metal is used in the second and third types of safes, the tough and hard qualities of the metal being obtained by modern processes of steel-making. The metal used is a soft sheet-iron, the surface of which can be hardened by cooling. In the construction of many vaults, blocks of chilled-metal, weighing from three-quarters to several tons, are bolted together on the inside, the sides being dovetailed together, and the outside surface is chilled to the highest degree of hardness. The door is a single casting of steel, two inches thick, and also chilled on the outside.

In the third type, the spherical, invented by William Corliss, the shell, constructed of steel from four to seven inches thick and chilled to a depth of about two inches, sometimes contains a "bugging" made from a special ore. This material, which is excessively hard and is in appearance somewhat like crystallized silver, is so interwoven with wrought-iron rods that it can be battered with immense force without damage. The purpose of this construction of wrought and crystallized iron is to hamper a burglar in his work, it being supposed that in an attempt to drill through the walls of the safe, the drill will penetrate the soft metal more readily than the hard, and, consequently, working sideways, will be broken off when it strikes the hard metal. The "bugging" may, however, be used in precisely the opposite manner, the rods being made of the hardest tool-steel and the body of the filling composed of cast-iron segments, but the principle of turning the point of the "cracksman's" drill is the same. The circular door is especially suitable for the spherical safe. They are closed after the manner of the breech-block of a large gun, with an interrupted thread or screw.

In large banks and safe-deposit vaults there is no room sufficiently large to contain the number of individual safes which would be required to hold the enormous masses of money and other valuable securities with which these institutions are entrusted. This has turned the attention of the manufacturer in recent years to the building of large vaults which would be absolutely fire and burglar-proof. The interior of these vaults may be constructed to suit the tastes and requirements of the owner, but the walls are now made much thicker than formerly and the builder has made more use of fire-proofing materials. The most important feature of the modern vault is the lock, which has now reached the acme of perfection. The first form of lock used was the combination-lock, an outgrowth of the "tumbler" lock, and the mechanism of these is very ingenious. These locks are not limited in the number of combinations upon which they may be set, and may be changed at any time should the combination become known to undesirable persons. The most valuable asset of the modern vault, however, is the chronometer, or time-lock, the mechanism of which is as intricate and as complicated as the best watch, but at the same time it runs as true and as smoothly. To offset any possible disarrangement in the mechanism of a single clock, which would, of course, prevent the opening of the safe, three movements are usually enclosed in a single case. As these safes cannot be opened by any available agency until the time set for the clock to operate the

mechanism which swings back the ponderous doors, it is obvious that the chronometer combination is the greatest safeguard against robbery which the bank can employ.

In 1914 there were 31 establishments engaged in the manufacture of safes and vaults, capitalized at \$6,898,000. They utilized the services of 2,107 employees, paying wages of \$1,366,000; manufactured products totaling \$5,366,000 in value, of which \$3,571,000 was value added to the cost of materials. These figures indicate a serious reduction in the industry in the decade, for in 1905 there were 3,488 wage-earners, and the gross products were \$7,861,000. The value of the American safe has been recognized in foreign countries, and to-day may be found throughout Great Britain, Europe, Asia, Africa, Australia, South America, etc. See LOCK; VAULT, ETC.

SAFED, sä'féd, Palestine, occupies the summit of a hill 2,700 feet high, on the shores of the Mediterranean, about 10 miles northwest of the Sea of Galilee. Safed was a fortified place of importance during the Crusades, and is one of the four holy cities of the modern Jews in Palestine, their settlement dating from the 16th century. Pop. (estimate) 19,000.

SAFETY-LAMP. See LAMPS.

SAFETY-VALVE, a device used upon steam boilers and other vessels subject to an internal pressure, for the purpose of automatically preventing that pressure from rising to a dangerous intensity. It consists essentially of an opening in the boiler (or other vessel) over which a suitable lid or "valve-disc" is fitted. The valve-disc is pressed against its opening with a definite, constant pressure, whose magnitude is regulated according to the pressure that the boiler is intended to carry. So long as the pressure that the steam within the boiler exerts upon the under side of the valve-disc is less than the constant force with which the disc is pressed down upon the opening, the valve remains closed and no steam escapes. If the pressure within the boiler rises, however, so that the steam exerts upon the disc a total pressure that is greater than the external force that tends to hold the disc in place, the valve opens and permits steam to escape until the pressure in the boiler is sufficiently reduced for the external force again to close the opening. There are three general types of safety-valve in use, which are respectively known as "dead-weight," "lever" and "pop" valves. The fundamental principle of operation is the same in all and the classification relates merely to the means that are employed to hold the valve-disc against the opening in the boiler. In the "dead-weight" valve this is accomplished by placing weights directly upon the valve-disc. Safety-valves of this type can be recommended for low pressure boilers and they are much used, in England, upon heating and upon kitchen boilers. They are not adapted for use in connection with high pressures, however, for the load resting upon the valve-disc must then be very great, in order to prevent the valve from opening at the ordinary running pressure. It is common, therefore, to use the "lever" type for high pressure service. In this type the valve-disc is held against its seat by the action of a weight, but the weight does not rest directly upon the disc. A horizontal lever two or three

feet long is provided, and this is pivoted at one end, while the weight is attached near its free end. The centre of the valve-disc comes directly under the lever, a few inches from the pivoted end, and the lever is supported by means of a stout vertical rod whose lower end rests upon the centre of the valve-disc. By this means the total downward force acting upon the disc and tending to keep it in position may easily be made to be 8 or 10 times as great as that which would be realized if the weight rested upon the valve-disc directly; and the pressure at which the valve will open can be nicely regulated by shifting the position of the weight upon the lever arm. In the "pop" valve the disc is forced against its seat by means of a stout spiral spring, which is held in position by a framework or casing which is securely attached to the boiler. The compression on the spring is regulated by means of a screw that acts upon its upper end and which can be turned by a wrench. It is now customary, however, to have the adjusting screw entirely within the casing of the valve so that the attendant in charge of the boiler cannot tamper with it; the casing being provided with a lock, the key to which remains in the possession of the owner of the boiler. The name "pop" refers to the sound that these spring valves make when they open and close. Lever valves and dead-weight valves open and close gradually and before they open they give warning by a hissing sound. "Pop" valves, on the contrary, open without any such premonitory signal, and when they close they do so with corresponding quickness. "Pop" valves are used exclusively upon railroad locomotives, as the violent swaying and vibration to which these are subject would render weighted valves undesirable.

SAFFLOWER, a large thistle-like composite plant (*Carthamus tinctorius*) with orange-colored flowers, said to have been originally brought from the East, but now naturalized in many parts of Europe and extensively cultivated. The tubular flowerets are collected, dried and used somewhat as a feeble laxative medicine, in place of, or as an adulterant of, saffron. They are, however, chiefly important as the source of carthamin, a dyeing principle originally much employed by the Chinese and later by Occidental silk manufacturers, as it gives brilliant, although fugitive, red tints; mixed with French chalk it forms the cosmetic rouge. In Spain the flowers are used to color soups and other dishes. The Jews in Poland are remarkably fond of the flowers and mix them with their bread and most of their viands. Oil, in India, is expressed from safflower seeds, for culinary and lighting purposes.

SAFFORD, Truman Henry, American mathematician and astronomer: b. Royalton, Vt., 6 Jan. 1836; d. Newark, N. J., 13 June 1901. He was early known as a calculator of great skill; in 1845 prepared an almanac; by a method of his own he abridged by one-fourth the task of computing the rising and setting of the moon, and after his graduation from Harvard was officially connected with the observatory there, 1854-66. In 1865 he was appointed professor of astronomy in the University of Chicago and director of the Dearborn Observatory; in 1874-76 was a member of the United

States Coast Survey, and in 1876-1901 professor of astronomy in Williams College. He was a Fellow of the American Academy of Arts and Sciences, of the American Association for the Advancement of Science and an associate of the Royal Astronomical Society of England. He studied the nebulae, discovering many new ones; computed cometary and planetary orbits and for some time devoted his attention to latitude and longitude work for the United States Corps of Engineers, for which he prepared a star catalogue. Among his further published writings were a catalogue of polar stars, 'Mathematical Teaching and its Modern Methods,' and numerous contributions to astronomical journals, to the 'Proceedings' of the American Academy and to the notices of the Royal Society.

SAFFRON, a bulbous autumnal plant (*Crocus sativus*) and a commercial dye-stuff obtained from it. The cultivated saffron originated probably in the Levant, and was grown in early times about the town of Corycus, Cilicia (from which the *Crocus* genus may have taken its name). The Arabs cultivated it in Spain about the 10th century, and it was an important crop in England, especially about Saffron Walden, Essex, in the 15th century, bringing the highest market price. It is now raised about the Mediterranean and in Asia. The saffron is low, with the grass-like leaves and long-tubed, funnel-shaped flowers, springing directly from the ground, which are characteristic of the crocuses. Its flower is purple, with a style tipped with three orange-colored stigmas, each more than an inch long, depending from one side of the perianth. These stigmas are picked off in the early morning and dried on a kiln, either loosely or between layers of paper, and under the pressure of a thick board which forms the mass into cakes, about 4,000 of these stigmas being necessary to give an ounce of saffron. In either case the commercial saffron is liable to suffer from adulteration. This adulteration was so prevalent at one time that those guilty of it (when caught) were killed.

Saffron stigmas, when genuine, have a characteristic orange red color and an aromatic, bitter odor and taste. The substance has faint carminative and narcotic properties, but is seldom used medicinally, except for coloring tinctures and occasionally as a diaphoretic in the eruptive diseases of children. In the 'Song of Solomon' the saffron is mentioned among the sweet-smelling herbs, and it was much in demand among the Greeks and Latins for its perfume. A fragrant essence was made from it with water and wine for sprinkling in theatres and other places, even in the streets, for anointing the hair and for the bath. Saffron was also much employed in culinary operations, chiefly for its aromatic taste and for coloring, as the clown in the 'Winter's Tale' says he "must have saffron to color the warden pies."

Saffron, however, is most commonly used as a dye, giving a yellow hue to cloth, but it is being displaced by cheaper colors. This tint was in very early times the royal color in Greece, and was that of some of the women's court robes, but afterward appropriated by the hetairæ. In Ireland and the Hebrides it was also the color of the king's mantle and of the shirts of persons of rank. Saffron enters largely into the composition of the sacred spot

on the forehead of a Hindu Pandit. An extract made from saffron, used as a glaze on tin-foil, imitated gold in mediæval illuminations, and was also employed by painters.

HELEN INGERSOLL.

SAG HARBOR, N. Y., village in Suffolk County, on Gardiner's Bay, an inlet from the Atlantic Ocean, and on the Long Island Railroad, about 100 miles east of New York. It has a good harbor, regular steamer connections with New York and several of the Long Island coast towns. It has several manufactories, chief of which are a watch-case and silverware factory, flour and cotton mills, a tannery and machine shops. The Sacred Heart of Mary Academy (R. C.), opened in 1877, a union school, public and parish schools and a library constitute the educational institutions. There are three banks with a combined capital of \$100,000. The village is a favorite summer resort. At one time Sag Harbor was noted for its interests in whaling; its income from that industry amounting to \$1,000,000 some years. In those days its tonnage equaled that of New York. The Indian relics found in and near the village show it was once an important Indian settlement. Pop. 3,000.

SAGA, Japan, capital of the province of Fizen, on the island of Kiu-siu, 74 miles north-east of Nagasaki. It is an important seaport and commercial centre. The town is intersected by numerous streams, chief of which is the channel of Sentonofutsi, 50 miles long. It unites the Gulf of Simabara with the Northern Sea, and is of considerable commercial importance. Pop. about 36,500.

SAGA. The word *saga* is cognate with German *Sage*, "a short tale," with which, however, it must not be confounded in meaning, and with English *saw*, "saying." In its limited and original meaning and without qualification, a *saga* is a story or group of stories in prose, of an historical character, relating in a series of episodes the whole life-history of a Scandinavian hero and written down in Norway or, mainly, in Iceland during the Middle Ages. The historical events which the sagas narrate took place mostly in the period which extended from the date of Iceland's settlement in 874 to the middle of the 11th century. That was the heroic age of the Icelandic people. At first the sagas were nothing but oral transmissions from one tale-teller to another. Their composition began about the middle of the 12th century and lasted for about 100 years.

In a wider sense the word *saga* is applied to any narration of events of the past, mythical as well as historical in character, but possessing the traits of the genuine *saga*. In these tales some legendary champion, from whom the *saga* takes its name and around whom the important events are centred, is the hero. Heroic achievement and marvelous adventure, fact and fancy, are mingled freely. In the course of generations the *saga* undergoes important changes, acquires accretions and takes on a more or less poetic and artificial character. Finally it is consigned to writing and handed down as a kind of rudimentary epic. When applied, as they frequently are, to works of that kind, in which the historic element is found in greater or less degree, the words *saga*, *myth*,

legend, *Märchen*, *épopee* and *epos* are used without clear distinction of meaning.

In the third and last stage of its development, the word *saga* has come to mean any free creation of the popular fantasy, sometimes incredible or even burlesque in character. Here the historical element is entirely lacking. In its widest sense, *saga* is sometimes used to include the entire body of the history and mythology of a people, or their literature or some division of it: hence we read of the Norse, German, Irish, or Greek sagas; of *saga* poetry, *saga* cycles, heroic sagas, beast-sagas, the Cuchulain saga, the Karl saga, the Nial saga. In Norse mythology *Saga* is also the name of a goddess.

The Icelandic sagas may be classified (1) geographically, according to the part of the country in which they arose or in which their scenes are located; (2) as major or minor sagas, the latter being more distinctly local in character and simpler in plot and interest than the former; and (3), as here, as (a) historical, (b) mythical, or (c) romantic. To the class of historical sagas belong: The well-known 'Landnámabók,' 'Book of Settlements' which contains a list of all the notable men who, up to 930, settled in the island. It contains much that is valuable on the religion, laws and customs of the people. It is preserved only in a version dating from the 13th-14th century. The 'Islendingasögur,' which embody the lives and achievements of celebrated Icelanders and the fortunes of great Icelandic houses from 950 to 1130. The 'Biskupasögur' are biographies of Icelandic bishops who flourished in the 11th and 12th centuries; they constitute an ecclesiastical history of Iceland, of less literary interest than the secular sagas but of the utmost historical value.

It would be difficult to say how much is to be regarded as authentic history in 'Nóregskonungasögur,' also called 'Heimskringla,' 'World-Circuit,' from the words with which it opens. This was the work of the greatest of all Icelanders, Snorri Sturluson, who was born in 1178 in West Iceland and became distinguished as statesman, scholar, poet and *saga*-man. It was written about 1230 and gives the history of the kings (chiefly) of Norway. The Icelanders never lost the feeling of connection with the motherland with which their country was in close relations especially in the time of Harald Hárfagri, when Iceland was settled, and of Olaf Tryggvason, when it was converted. The *Heimskringla* possesses all the most excellent features of the best *saga*-art. At about the same time the 'Gudmundarsaga Dyra' was written. Of historical importance also is the 'Sturlungasaga,' 'the history of Sturla,' which is a collection of later *Islendingasögur*, telling of events which happened as late as the year 1250. The tales belonging to this *saga* arose in West Iceland about the beginning of the 14th century and contain some of the finest narrative passages in the whole body of Icelandic literature. The 'Thordharsaga Sighvatssonar' treats of Icelandic history up to the same period. The mythical sagas are those that treat of the old heroic legends, some of which, like the 'Völsunga Saga,' which is a prose rendition of the Nibelungen story as given in the Eddic lays, are the common property of all the German peoples, while others,

like the 'Frithjofs Saga,' is particularly Scandinavian.

The 'Fornaldarsögur' 'Tales of the Past' deal with the early history of Iceland and are partly of a fairy and romantic character, telling of Viking voyages, love adventures, battles with berserker and monsters. The romantic sagas, as, for example, the 'Riddarasögur,' are mostly translations or adaptations of foreign (chiefly French) courtly epics and romances of chivalry, such as the tales of Troy, of Alexander, Charlemagne, Arthur and the Round Table, Barlaam and Josephat. They were reduced to writing in the 13th century and became favorites in the 15th. They are purely literary and have no historic value. Besides these, which are the three principal classes of sagas, there is a kind called *Tháttir*, which is a short tale treating of a single episode in the life of a distinguished Iclander, and the simplest form of saga. There are also sagas dealing with the Faroes, the Orkneys, Norway, Denmark, Greenland and America. Among the minor sagas may be mentioned 'Gísla,' which is perhaps the most tragic of all the sagas, or at any rate the most conscious of its tragic aim; 'Gretis Saga'; 'Bandamannasaga' ('The Confederates'), which, quite exceptionally, is humorous and the first comedy in western Europe; 'Kormáks saga,' which is very romantic; 'Erikssaga Raudha' ('The Saga of Erik the Red'), which tells of the discovery, in 982, by Erik, of Greenland and Vineland; his son Leifr discovered the North American coast, probably Nova Scotia; 'Bjarnarsaga,' 'Heiðharvigasaga,' 'Viga-Glúmssaga,' 'Vápnfirðingasaga' and 'Hrafnkelssaga Freysgodha,' which belong to the 12th century; 'Gunnlangssaga' and 'Flóamannasaga,' which were composed in the 13th century; and 'Hítðælakappa,' 'Hænsna Thóris saga,' 'Hardharsaga,' 'Grimkelsson,' 'Gullthóris saga,' 'Fóstbrœðhrasaga,' 'Vatzdœlasaga,' 'Svarfdœlasaga,' 'Valla-Ljótssaga,' 'Ljósvefningasaga,' 'Reykðœlasaga,' 'Thorsteins-Hvíta' and 'Droplaugarsonasaga.'

The following four are the greatest of the Icelandic sagas: (1) The 'Eyrbyggjasaga,' which covers a period of about 140 years (890-1030) and was written probably by a cleric about 1225. It is remarkable for the great variety and richness of its adventure and for the light it throws on the manners and customs of the period. Its style is serious, measured and realistic. (2) The 'Egillssaga,' which takes its name from that of the skald (poet) Egill, portrays the life of the 9th and 10th centuries. As his sources, its author made use of oral traditions, other saga material and Egill's own poems and put the whole into writing about the year 1200. (3) The 'Laxdœlasaga' is, for the modern reader, the most romantic and one of the most attractive sagas. The incidents took place between 910 and 1026, and the scene is laid among the people of Laxáttals in West Iceland. Here, too, the author, who was also probably a cleric, made masterly use of his sources, some of which may have been Irish, both oral and written. (4) The saga universally recognized as the ripest and most brilliant product of the saga-art is the 'Njáls saga.' It is composed of two originally independent sagas, those of Gunnar and Njál and belongs to the south of Iceland. It is designed on the most liberal scale

and is remarkable for the masterly way in which its plot, full of intrigue, love and hate, has been handled, and for its character-drawing and simple and effective style.

In Iceland and Ireland, more than anywhere else in western Europe, story-telling was a necessary part of every assembly. The professional sagaman wandered from place to place, told his stock-in-trade, received entertainment and rewards in return for them and gathered material for new stories. These tales, both those of an historical and those of a legendary character, being of oral transmission, even when later they were thought fit to be consigned to writing, always used the oral saga as a background. Almost all the events narrated in them took place between the years 950 and 1030. That was the Saga Age of Iceland, when life, in a material sense, was almost barbarous and factional fights were of frequent occurrence. The sagaman made most of the abundant stuff at hand for heroic narrative. His heroes are represented as being almost more than human men and women. They belong, for the most part, to the ruling class. The author gives a short account of the hero's family, of his youth and manhood, his loves, friendships and enmities, his great deeds and his death, which was usually of a tragic character. Being based almost entirely on actual happenings and being in close relation to the lives of those for whom they were recited or written, the sagas convey a wonderfully faithful picture of life not only in the Scandinavian world during those centuries but also among the other Germanic peoples who once lived in similar circumstances but have left no such record of their own past.

The very language in which the sagas are couched is greatly conducive to the appearance of reality. It is in prose and very often in the form of dialogue. As the sagaman's main object was to move his hearers, he told his tales in unaffected, straightforward language, the everyday language of the people. Like a dispassionate observer, showing no sympathy with either the events or their heroes, he was content to assemble the incidents and to relate them briefly and restrainedly. The result, however, is much more than a mere impersonal folktale. Even at that early date it is surprising how clearly the essential rules of all good story-telling seem to have been fixed and were observed to perfection; dramatic irony and suspense; the orderly, steady progression of the scenes; the recurrence of personages familiar from other sagas, the chief figure in one becoming a subordinate character in another; the incidental mention of unheroic "mean" details; all this adds to the interest of the saga. One thing the Icelandic sagaman—like the contemporary Irish *sgéulaidhe*—could do supremely well, and that was to tell a story. The Icelandic sagas stand apart at once as a notable phenomenon in literary history and as an absolutely independent creation of the northern mind. See ICELANDIC LITERATURE.

Typus des isländischen Saga' (Leipzig 1877); Golther, 'Nordische Literaturgeschichte' (ib. 1905); Golther, 'Die isländische und norwegische Literaturen des Mittelalters' (Sammlung Göschen, No. 254); Heinzel, 'Beschreibung der isländischen Saga' (Vienna 1880); Olrik, A., 'Nordisches Geistes-

leben' (Heidelberg 1908); Ker, W. P., 'Epic and Romance' (London, 1897); Carlton, W. N., 'The Icelandic Sagas' (Chicago 1912); Vafarsson, G. (editor), and Dunsen, Sir G. W. (translator), *Icelandic Sagas and Historical Documents*, (Rolls Series, London 1887-94).

JOSEPH DUNN,

*Professor of Celtic Languages and Literature,
The Catholic University of America.*

SAGARD-THEODAT, Gabriel, French Catholic missionary; b. 16th cent. He labored in converting the Huron Indians to Christianity during the 17th century and contributed in an important degree to a knowledge of Canada in its early colonial days as 'New France'. His principal works are 'Travels to the Huron Country, towards the Freshwater Sea and the Uttermost Limits of New France, called Canada; Wherein is Treated of all Matters touching the Country, the Manners and Character of the Savages; their Government and their Ways, as Well in their Own Country as when Roaming; of their Faith and Belief; with a Dictionary of the Huron Language' (1632); also 'History of Canada and the Journey Made by the Friars Minor Recollects Thither, for the Conversion of Unbelievers' (1636). An edition of his works was published at Paris in 1866.

SAGASTA, sã-gãstã, Praxedes Mateo, Spanish statesman; b. Torrecilla de Cameros, 21 July 1827; d. 5 Jan. 1903. He studied at the College of Engineers in Madrid; practised as an engineer in Valladolid and Zamora; in 1854 was elected from Zamora province to the Cortes, where his attitude was a radical one. In 1856 for participation in an unsuccessful revolt he was compelled to escape to France. Upon the proclamation of amnesty he returned, became professor in the Madrid College of Engineering, re-entered the Cortes, was identified with the Progressive minority and edited its journal, *La Iberia*. After the outbreak of 22 June 1868 he again fled to France, but at the beginning of the revolution of 1868 was once more in Spain, where he became Minister of the Interior in the provisional government. In October 1871 he was chosen to the presidency of the Cortes; in December he entered the Malcampo Cabinet as Minister of the Interior; in February 1872 was commissioned to form a new ministry, but in May was forced to resign. In 1874 he appeared anew in office as Minister for Foreign Affairs in the Serrano Cabinet, but shortly afterward exchanged his portfolio for that of the Interior, and in August became president of the Ministry. He retired from office at the accession of Alfonso XII; for a time was a leader without a party; as a member of the Cortes was finally associated with Martínez Campos (1881) in the organization of the new Liberal party, and upon the overthrow of the Conservatives became president of the Ministry. He was forced from power in 1883. Subsequently he was president of the Cortes in 1883-84 and of the Ministry in 1885-90 and 1892-95. In September 1897 he was again summoned to form a cabinet. He recalled Weyler from Cuba, appointed Blanco captain-general and drafted a plan for Cuban autonomy. Although opposed to the war with the United States he waged it with such efficiency as his

limited resources would permit and was loudly denounced for signing the treaty of peace. On 4 March 1899 he resigned with his entire cabinet, though on 6 March 1901 he again took the helm and, after averting a Carlist insurrection, remained in office until 3 Dec. 1902. He has been characterized as "singularly devoid of the blind arrogance which has been the bane of so many Spanish statesmen." After Canovas' death he was conceded to be the greatest political figure of Spain.

SAGE, sãj, Henry William, American philanthropist; b. Middletown, Conn., 13 Jan. 1814; d. Ithaca, N. Y., 17 Sept. 1897. In 1832 he engaged in the lumber business which he conducted until 1854, settling at Ithaca, N. Y. He entered the New York assembly in 1847. His earlier benefactions were the endowment of various schools and churches, the West Bay City, Mich., public library, and the Lyman Beecher lectureship at Yale College. In 1870 he became a trustee of Cornell University and his various gifts to that institution were \$266,000 for the Sage College for Women; \$200,000 for the Sage School of Philosophy; \$50,000 for the Susan Lynn Sage chair of philosophy; \$200,000 with an additional endowment fund of \$300,000 for the University Library Building; \$20,000 for the Museum of Classical Archaeology; \$11,000 for the Sage professorship of philosophy; \$300,000 for floating indebtedness. His careful management of timber lands owned by the institution realized for it about \$6,000,000.

SAGE, Russell, American capitalist; b. Verona Township, Oneida County, N. Y., 4 Aug. 1816; d. Lawrence Beach, L. I., 22 July 1906. He began life as clerk in his brother's grocery store; entered the retail grocery business for himself in 1837, and during 1839-57 was a wholesale grocer at Troy, N. Y. He was alderman of Troy in 1841-47; treasurer of Rensselaer County, and a Whig member of Congress during 1853-57. In 1863 he removed to New York and shortly began large operations in railroad and other securities. He accumulated one of the largest fortunes in America and was director in many large corporations.

SAGE, Russell, Mrs. (MARGARET OLIVIA SLOCUM), philanthropist; b. Syracuse, N. Y., 8 Sept. 1828; d. New York, 4 Nov. 1918. She was the daughter of Joseph and Margaret Pierson (Jermain) Slocum, and after early vicissitudes graduated at the Emma Willard Seminary at Troy, and became a school-teacher. She taught in schools at Philadelphia, Syracuse and Troy, until at the age of 41 she became the wife of Russell Sage (q.v.), a grocer at Watervliet (then West Troy). Their home life continued simple, in spite of the great wealth which they accumulated, and Mrs. Sage took such deep interest in her husband's affairs that five years before his death he turned over to her complete control of his business and found that his faith was borne out by her successful operations. After his death her life was largely devoted to benevolent work and during the last seven years of complete stewardship of the \$70,000,000 left by her husband, she returned nearly \$30,000,000 to the public by systematic philanthropies.

SAGE, William, American novelist, son of Abby Sage Richardson (q.v.); b. Manchester,

8 May 1864. He was educated in France and Germany, was engaged in railway and banking business 1881-96, and since then has given his attention to literature. He has published 'Robert Tournay' (1900); 'The Claybornes' (1902); 'Frenchy—The Story of a Gentleman' (1904); 'The District Attorney' (1905); 'By Right Divine' (1907); 'A Maid of Old Virginia' (1915).

SAGE, a name covering both the common garden herb (*Salvia officinalis*) and other plants of diverse families, somewhat resembling it in color or odor. The cultivated sage is a mint, and the genus differs from the majority of labiates in having two stamens instead of four. It is a native of southern Europe, a shrubby perennial of hoary aspect, bearing rough, wrinkled, gray-green, opposite leaves, on the decumbent stems, and pale-blue, streaked flowers in verticillate spikes at the extremities of the branches. It has been widely cultivated, for at least three centuries, on account of its aromatic odor and bitter, pungent taste. It was formerly used in medicine, having slight tonic, stimulant and astringent properties. An infusion of the plant, or "sage-tea," was drunk in England before the advent of Chinese tea, was a favorite remedy for colds and is even now employed as a gargle. An old English proverb states that "He that would live for aye must eat sage in May." See HERBS, CULINARY.

Many salvias, or sages, are frequently cultivated for their brilliant flowers. The most common, perhaps, are the scarlet sage or salvia (*Salvia splendens*) with racemes, perhaps a foot long, of slender flowers two inches long, arranged in whorls, both calyx and corolla being of a most brilliant scarlet hue; and the equally large-flowered but blue-tinted *S. patens*. The woolly white foliage of *S. argentea* has caused it to be included in gardens, and there are a score of others quite worthy of cultivation for ornament.

Several genera of the *Chenopodiaceæ*, a family which takes kindly to alkaline soils, and which inhabit the desert regions of western North America, are called salt white, or silvery sages. Bitter sages are composites, and are more commonly known as sage-brush (q.v.). The salt sages are species of *Atriplex*, living on thousands of acres of waste lands, which are strongly impregnated with alkali, and so dry that little other vegetation can exist. Since water is so scarce in certain of these alkali deserts, stock cannot be taken into them in summer, and the sages make a good growth, the fruits, valuable for their nutritive qualities, become ripened and the leaves "sun-cured," which, together with the tender spring shoots, make excellent forage, particularly for sheep. The flocks are taken in in winter, when the snow furnishes water for them, and eat the salt-bushes greedily, Nuttall's sage (*A. nuttallii*) being the most valuable, as it is perennial with a deep, woody root, and although cropped, seeds and all, quite down to the ground, survives and starts up again, during the summer, when it is undisturbed. In fact, the constant cropping of these pastures, and the constant manuring, are improving the winter ranges, which are thus becoming nearly as valuable as the summer ones. The white-sage or winter-fat (*Eurotia lanata*) is another highly prized

winter forage plant, a foot or more high from a shrubby base, whitened with long hairs, perennial and with abundant fruit, that contributes largely toward the great fattening qualities attributed to this sage, which is also supposed to have a beneficial effect on the grazing stock. The shad-scale, a spiny, shrubby salt-sage (*Atriplex confertifolia*) produces in the spring tender shoots and thick succulent leaves and enormous quantities of flat, winged seeds. These are eagerly sought at the time, and, in the autumn, when leaves and fruit have dropped and been blown into hollows of the plain, the sheep seek them out and devour them utterly.

HELEN INGERSOLL.

SAGE-BRUSH, any one of the species of the genus *Artemisia*—composites very abundant in the arid, alkaline regions of the western United States, where the soil is not too saline, and, with other desert vegetation, covering immense areas. The best-known sage-brush is the common shrub, or bitter-sage (*A. tridentata*), which is found growing on the plains and ascending to the sub-alpine parts of the mountains. It varies in different situations from a dwarfed shrub to almost tree-like proportions, when its trunk near the ground will measure nearly a foot through, being twisted and knotty and loosely enveloped in a light-gray, shreddy bark.

SAGE-BRUSH STATE, or **SAGE-HEN STATE**, a nickname for the State of Nevada, from the large amount of sage-brush growing there.

SAGINAW, Mich., city and county-seat of Saginaw County, on the Saginaw River, 16 miles from Saginaw Bay, 97 miles northwest of Detroit and 65 miles northeast of the capital at Lansing. The railroads entering the city are six divisions of the Pere Marquette, three divisions of the Michigan Central and one division of the Grand Trunk. Built upon both banks of the beautiful Saginaw River, here spanned by seven public and four railroad bridges, the city lies at the head of deep-water navigation communicating with the Great Lakes. The third in size in the State, Saginaw is a city of great beauty and attractiveness; it possesses an ideal climate without extremes of heat or cold, has handsome residences and ranks well with any city in the United States in the percentage of fine modern homes owned by its workmen. Upon the Dixie highway, surrounded by an excellent road system, it is a central point of the tourists' highways of the State, readily accessible to automobile tourists.

Industries, Manufactures, etc.—Industrially the city is fortunate in possessing an immense supply of hydro-electric current, and being the centre of the bituminous coal fields of Michigan, from which over 2,000,000 tons are mined annually in the neighborhood. Lumber, sand quarries and salt wells also abound, and a productive sugar-beet region is cultivated. Saginaw was at one time the centre of the white pine industry, and millions of dollars worth of logs have been floated on her river. This vast industry, through deforestation, has given way to manufacturing, and the city is now distinctively a manufacturing and jobbing centre. Some of the manufactures are products of numerous general mortar plants, beet sugar,

plate glass, salt, iron and steel products, furniture, pianos and musical instruments, vehicles, baskets and a great variety of wood products, malt liquor and flour. It has planing mills, lumber assorting yards, brick yards, tanneries, graphite works and a variety of foundry and machine shops, in addition to the big shops of the Pere Marquette Railroad Company. Over \$35,000,000 of capital is invested in manufacturing industries, and the annual value of the total products averages nearly \$30,000,000.

Municipal Conditions.—Strong banks, metropolitan newspapers, a commission form of government since 1914, low tax rates, 100 miles of pavements, \$10,000,000 in pavements, sewers, sidewalks and other municipal improvements, public baths and playgrounds, 60 churches, are evidences of healthy civic development and growth. Saginaw has model school system which has set and kept the pace with other communities. It has been quick to grasp the public pulse and take advantage of advanced 20th century ideas. The city has an advanced trade school in the Arthur Hill Trade School and a splendid manual training school in the Burt Institution. The Public and the Hoyt libraries are also well-equipped institutions. The hospitals are the Saginaw General Hospital, Saint Mary's Hospital and the Woman's Hospital. Other charitable institutions are the Home for the Friendless and Saint Vincent's Orphan Home. The city has one of the finest Masonic Temples in the State, Elks' Temple, a handsome Federal building and post office, city hall, courthouse, K. of C. and Y. M. C. A. buildings, handsome clubhouses, theatres and numerous capacious public halls. The streets of the city are for the most part notable for their width. They are traversed by an excellent electric street railway system and interurban roads reach out into the surrounding country. The east and west sides are connected by a number of fine bridges over the river, so that access is easy from the business centre to the most remote parts of the city. In addition to the numerous small parks, the city has a large suburban resort, operated in connection with the street railway system.

History and Population.—The site upon which this prosperous community is located was first settled in 1815 by men of French origin and half breeds; and here, 24 Sept. 1819, the Treaty of Saginaw was concluded between Gen. Lewis Cass and the Indians, which ceded extensive tracts of land to the United States. The city of Saginaw is a consolidation of old Saginaw City, East Saginaw and the village of Salina or South Saginaw. The latter was incorporated as a village in 1866 and became a part of East Saginaw in March 1873. East Saginaw was incorporated as a village in 1855 and as a city in 1859. Saginaw City was never incorporated as a village, its first incorporation being as a city in 1857. The two municipalities, East Saginaw and Saginaw City, were consolidated by act of the legislature of 1889 into the city of Saginaw, and the first meeting of the common council of the consolidated city was held 12 March 1890. The population of Saginaw is cosmopolitan in character, the German possibly predominating, as attested by their numerous large and prosperous societies of an educational and social character. The Irish, French, Polish and Bohemian are

also conspicuous elements of the city's population, which is about 80,000.

CHESTER M. HOWELL,
Assistant Secretary, Saginaw Board of Commerce.

SAGINAW, a river in Michigan which is formed by the junction of the Flint and Shiawassee, and flows nearly due north into Saginaw Bay. The main stream is only about 20 miles long, but with its branches it drains a large portion of the Lower Peninsula. It is navigable to the city of Saginaw, 16 miles.

SAGINAW BAY, the largest inlet of Lake Huron on the coast of the United States. It indents the east coast of the Lower Peninsula of Michigan. It is about 60 miles long and from 20 to 30 miles wide. It is a safe harbor and never dangerously rough, although it is sometimes subject to storms. The color of the water is different from that of the open lake; it is a brownish-green.

SAGITTARIA, säj-i-tä'ri-a, a genus of plants of the water-plantain family (*Alismaceæ*). It is a widely distributed genus, wholly or partly aquatic, native to the temperate zones and the tropics. The species are handsome, with lance-like, elliptical or arrow-shaped leaves, erect or floating; the flowers are verticillate in threes around the upper part of the scapes that carry them well above the water, and are three-parted, with beautiful white and crinkled fungacious petals. The common arrow-head (*S. latifolia*) grows in the mud along rivers and ditches, and is very ornamental with its charming whorls of flowers rising from the centre of a cluster of large, erect, sagittate leaves, varying surprisingly in different plants in respect to size and shape. It is a perennial, with thick fibrous rootstocks, which produce oval, fleshy tubers, often as large as a hen's egg, abounding in starch, and a staple and nutritious article of food with many Indian tribes. The squaws sometimes waded into the mud where the arrowheads grew thickly, loosened the tubers with their toes and when the plants floated to the surface captured them and flung them into canoes, to be boiled or roasted. *S. chinensis* is cultivated in China for food.

SAGITTARIUS, säj-i-tä'ri-us, in astronomy, the ninth sign of the zodiac, into which the sun enters 22 November. The constellation consists of eight visible stars. It is represented on celestial globes and charts by the figure of a centaur in the act of shooting an arrow from his bow.

SAGMULLER, Johannes Baptist, German ecclesiastical historian: b. Winterreute, Württemberg, 24 Feb. 1860. He was educated at the Latin School of Mergentheim, the Ehingen High School and the Seminary of Tübingen. He was ordained to the Roman Catholic priesthood in 1884; was curate at Alpirsbach in 1884-87, and tutor at Tübingen Seminary in 1887-93. He was special professor of history in 1893-96 and since 1896 has been professor of canon law and pedagogics at the University of Tübingen. His published works include 'Die Papstwahlen und die Staaten von 1447-1555' (1890); 'Die Papstwahlhüllen und das staatliche Recht der Exklusive' (1892); 'Zur Geschichte des Kardinalats' (1893); 'Die

Tätigkeit und Stellung der Kardinäle bis Papst Bonifaz VIII' (1896); 'Die Entwicklung des Archipresbyterats und Dekanats bis zum Ende des Karolingerreichs' (1898); 'Lehrbuch des katholischen Kirchenrechts' (1904; 2d ed., 1909); 'Die kirchliche Aufklärung am Hofe des Herzogs Karl Eugen von Württemberg' (1906); 'Die Trennung von Kirche und Staat' (1907); 'Wissenschaft und Glaube in der kirchlichen Aufklärung' (1910); 'Unwissenschaftlichkeit und Unglaube in der kirchlichen Aufklärung' (1910); 'Der Rechtsanspruch der katholischen Kirche in Deutschland auf finanzielle Leistungen Seitens des Staates' (1913). He has also contributed to periodicals and encyclopedias.

SAGO, a farinaceous food, obtained from the central portion of various species of tropical palms, principally, however, from *Metroxylon rumphii* and *M. laeve*. The sago-palms flourish in wet soil, and are cultivated in the East Indies, and particularly in Sarawak. They are rarely over 30 feet high and have stout stems, with an outer rind about two inches thick, as hard as bamboo, but filled with spongy pith, containing a large proportion of starch.

The preparation of sago is one of the industries of the East Indies. The trees flower only once, and if allowed to do so, and to fruit, would exhaust the mass of starch stored in their stems, and then die, after propagating themselves either by seeds or by offshoots. To prevent this, the trees are felled when they are about 15 years old and on the point of flowering. The starchy tissue, then most productive, is extracted and pounded or grated to a powder. This is kneaded in water, in a cloth or sieve, the escaping water carrying the starch into a trough, where it is washed and settled out, until fit for use. The water is then drawn off and the caked residue is ready for native cookery. This cake, or meal, when made into a paste and pressed through a sieve, forms fine pearly grains, which are left either in their original brownish hue, or are bleached, and compose the commercial product "pearl-sago."

Sago-meal is eaten by the natives as pottage, or as biscuits, partially baked in earthen molds. It is not entirely soluble in hot water, as is ordinary starch, and can, therefore, be employed in making puddings, etc., forming a valuable article of food, as it is cheap, nutritious and easy of digestion. In Europe it is used for feeding stock, making starch and by cocoa manufacturers for their beverages. Inferior qualities of sago are produced by *Phœnix farinifera*, *Corypha* of various species, *Caryota urens*, *Raphia flabelliformis*, and two South American palms.

Portland sago is a delicate farina extracted from the corm of the European wake-robin (*Arum maculatum*). Wild sago is the product of the coontie-root (*Zamia integrifolia*), a cycadaceous plant of Florida, well known as an article of food among the Seminoles; and other cycads, incorrectly called "sago-palms," furnish a coarse kind of sago.

SAGOIN, sa-goin', or **SAGOUIN**, a French form of the native South American name of a genus (*Callithrix*) of Brazilian monkeys, of small size and remarkably light, active and graceful in their movements.

SAGOYEWATHA. See RED JACKET.

SAGUA LA GRANDE, sā'gwā lā grān'dā, Cuba, town in the province of Santa Clara, on the Sagua la Grande River, 150 miles east of Havana. It is connected by railroad with La Isabela, its port on the north coast, with Cienfuegos, Havana and Matanzas, and with towns to the east; and carries on a considerable trade, sugar and molasses being the chief exports. Formerly gold was mined in the vicinity to some extent. It is well built, with wide and regular streets; among its public buildings are a hospital, a town-hall and a large church; it has also several schools. Pop. about 12,500.

SAGUENAY (sāg-ě-nā) RIVER, Canada, large river in the province of Quebec, emptying into the Saint Lawrence at Tadousac Harbor. It is about 120 miles long and of remarkable depth—17 to 500 fathoms. It drains Lake Saint John and flows with almost unparalleled impetuosity, between high rocky walls and over deep precipices, forming numerous falls and cataracts in its upper course. Its magnificent scenery attracts many tourists. It is navigable for large vessels as far as Ha Ha Bay, 10 miles south of Chicoutimi.

SAGUNTUM, sa-gūn'tūm, now **SAGUNTO**, or **MURVIEDRO**, Spain (*Hispānia Tarraconensis*), situated near the mouth of the Palantias, three miles from the coast and 18 miles by rail from Valencia. It was a rich commercial town in early times, especially famous for its figs and manufacture of a certain kind of pottery. The town was founded by Greek, according to some, and by Italian colonists. In the interval between the First and Second Punic wars, it formed an alliance with the Romans, and became celebrated for the resistance it made to Hannibal in the siege of 219-218 B.C. The city was nearly destroyed at this time, but the Romans rebuilt it and made it a colony. The ancient city is now replaced by the modern Murviedro, and the only important ruins are those of the theatre. Pop. about 9,000.

SAHAPTIAN. See SHAHAPTIAN INDIANS.

SAHARA, sa-hā'ra, Africa, the great desert region in the north of the continent, extending from the Atlantic eastward as far as the Nile, and from the Mediterranean provinces to the Niger and Lake Tchad. Its area is about 3,459,500 square miles,—a region equal to the whole of Europe. The configuration is irregular and the surface highly diversified, reaching from 100 feet below the sea-level to an altitude of from 5,000 to 8,000 feet in Mount Tusidd. Some of the highest summits are those of the Ahaggar, a great mountain plateau. Air or Asben is an isolated mountain, midway between Tibesti and the Niger. Farther south is the extensive plateau of Adghagh. At the northeast in Fezzan are the dark mountains of Jebel es Sôda. The rest of the Sahara consists generally of undulating rocky surfaces and sand dunes interspersed with occasional oases. The date-palm flourishes on these green spots, also the olive tree. Apples, peaches, oranges, grapes, etc., grow, and wheat, barley, rice, durra and other tropical crops are raised, and there is a considerable variety of flora. Mammals consist, outside of the domestic animals, such as camels, asses, black cattle, etc., of 15 species, compris-

ing the jerboa, fox, jackal, baboon, hyenas, mountain sheep, etc.; about 80 species of birds, among which is the ostrich. There are also tortoises, lizards, chameleons, serpents, such as the python, horned viper, etc. The edible frog and fish also occur. There is an important trade in silk tissues and mixed goods, ivory, ostrich feathers, gums, spices, musk, hides, gold dust, indigo, cotton, palm oil, kola nuts, silver, dates, salt and alum. The exports are textiles, weapons, gunpowder, etc. Many thousand tons of phosphate are extracted. The range of temperature is very great. The chief centres of population are the oases. The inhabitants consist of Moors, Tuareg, Tibbu, Negroes, Arabs and Jews; the former occupy the region between Fezzan and Lake Tchad. The tribes of the desert inhabit the south of Algeria and Tunis. The Tuareg control the principal caravan routes. The Tibbu, who number about 200,000, live in the oases between Fezzan and Lake Tchad. The tribes of the desert are, generally speaking, camel drivers, slave and salt dealers, guides and robbers. A few possess date-groves, but they usually subsist on the milk of their herds, bartering for fruits or grain. The principal caravan routes lead from Timbaktu to the Wady Draha, and to the oasis of Twat; from Haussa by Air or Asben and Ghat to Ghadames and Murzuk; from Bornu by Bilma and Murzuk to Tripoli; from Wady by Ojariga, Kufara and Aujilah to Benghazi, and from Darfur to Siut. Pop. about 2,000,000.

SAHARANPUR, sa-hār-an-poor', or **SEHARUNPOOR**, sē-hār-ūn-poor, India, (1) capital of a district of the same name, in the United Provinces of Agra and Oudh, 90 miles northeast of Delhi. It is an important railway junction. Among the buildings the most noteworthy are an old Rohilla fort (used as a courthouse), and a fine Mohammedan mosque. The residential part is substantial and modern. There is a church, an American Presbyterian mission and a fine botanical garden for experiments in tea and cinchona. Commerce in grain, sugar, molasses and country cloth is considerable. Pop. about 70,000.

(2) The district in the Meerut division has an area of about 2,242 square miles, and occupies an alluvial table-land between the Ganges and the Jumna. It consists partly of wildly picturesque broken ground, but the larger portion is tillable. Cereals are the chief products, and its commercial importance is considerable. Pop. about 1,200,000.

SAHIB, sā'ib, the term of native address in India to a reputable European. It is an Arabic word, signifying companion or lord. The feminine form is *Sahibā*.

SAI, sā'i, a Brazilian native name for a local monkey of indefinite application, most often, perhaps, designating the capuchin (*Cebus capucinus*).

SAID PASHA, sā-ēd pāsh'ā, Turkish statesman: b. 1835; d. Constantinople, 29 Oct. 1907. He commanded an army corps in the Russo-Turkish War, became governor of Cyprus and was later appointed Secretary of State. He was Premier 1879-82, was grand vizier 1882-85 and was twice dismissed but reinstated by the sultan in 1883. In 1885-95 he was Minister of Foreign Affairs, and subsequently president of the Council of Ministers.

SAIGA, si'ga, an antelope (*Saiga tartarica*) found on the steppes of Russia and in western Asia. It is about two and one-half feet high at the shoulders, pale bluish-gray in color and is remarkable for the greatly swollen appearance of the nose, due to the thick cartilaginous coverings of the nostrils. It once had a far wider habitat in Europe, and is steadily diminishing in range and numbers.

SAIGO, Kichinoswke Takamori, Japanese general and patriot: b. Kagoshima, 1825-32; d. there, 24 Sept. 1877. He was of the samurai class and from early youth an enthusiastic partisan of the Mikado. In 1858 the vigor with which he urged the overthrow of the Tokugawa administration caused his banishment to Satsuma. He took an important part in the restoration of the Mikado in 1868, fighting with the forces of the imperial family in the civil war which preceded it. He was afterward appointed commander-in-chief of the army by the Mikado and retained the office until 1873 when, his desire to attack Korea being overruled, he resigned and retired to Kagoshima. Himself of the samurai class, which was largely disaffected because of opposition to the progressiveness of the emperor, he rallied a large force to his support and early in 1877 launched a rebellion against the government. After continued stubborn fighting and a steady, if slow, forced retreat he fell in action at Kagoshima. The government, notwithstanding his attempt to overthrow it, mindful of his invaluable services in establishing the Mikado on the throne, afterward erected a bronze statue of him at Tokio.

SAIGO, Yorimichi (Judo), MARQUIS OF, Japanese field-marshal and statesman, brother of K. T. Saigo (q.v.): b. Satsuma, 1843; d. 1902. He was of the samurai class and took a prominent part in the restoration of the Mikado in 1868. In the crisis of 1873, when his brother Takamori withdrew from office, Saigo remained in sympathy with the government. He commanded the Japanese expedition to Formosa in 1874, and from 1877 until his retirement in 1900 held various cabinet offices. He received rank as marquis in 1895.

SAIGON, si-gōn (Fr. si-gôn), or **SAIGUN**, Indo-China, the capital of Lower Cochinchina before the French conquest, is on the right bank of the Saigon or Don-nai River, 34 miles from the sea. The town was nearly destroyed by the French, and the present city dates practically from 1861. It has fine public buildings, modern shaded streets and zoological and botanical gardens; of educational institutions, the colleges of Chasseloup-Laubat and d'Adran are the most important. There is a large floating dock. The majority of the population is Asiatic, the Chinese element predominating. The town has an active trade with China, Siam, Singapore and Java. Considerable French and English goods are imported. The main exports are rice cotton, silk and hides. The great market is Cholon, three and one-half miles from Saigon. Pop. about 80,000; Cholon, 127,000.

SAIL, or **SAIL-TAILED**, **LIZARD**, a large agamoid lizard (*Lophurus amboinensis*) of the Philippines, Celebes, Java and neighboring islands, which takes its name from the tall sail-like crest bone upon the upper surface of

the tail of the adult, which is supported by a great lengthening of the spines of the vertebrae of that region; the tail otherwise is highly compressed, long and powerful. The lizard frequently exceeds three feet in length, is olive-green, spotted and marbled with black, and has many curious folds of skin about the neck. It is strong and active and spends much of its time in trees, but when alarmed or chased rushes for water, dives to the bottom and endeavors to hide among the stones. It is defenseless and harmless, and its flesh, which is white and tender, is much liked by the islanders.

SAIL. See **SHIP**.

SAILCLOTH, a coarse, strong linen, cotton or hempen cloth used in making sails. The best is made of flax, and combines flexibility with lightness and strength. See **SHIP**.

SAILFISH, a large predaceous fish (*Istiophorus nigricans*) of the West Indian and neighboring waters, which is closely allied to the sword-fishes and of the same family as the spear-fishes (*Tetrapturus*). It reaches a length of six feet, has an elongated, much compressed body, covered with elongate scutes, and a powerful, deeply forked tail, while the dorsal fin is, relatively, of huge size and deeply notched outline, well simulating the appearance of a ship under sail as it appears above the water when the fish glides along the surface as it frequently does. The bones of the nose are prolonged into a "sword," not so long as that of the sword-fish, but sharper, and they are an effective weapon in a school of small fish.

SAILING. See **NAVIGATION**; **SHIP**; **SAILING VESSELS**.

SAILING VESSELS. The first vessel of which history gives any description is the *Ark*, as built by Noah. Its proportions possess some interest, because, though not intended for a voyage, it may be inferred that it was constructed to float with as little motion as possible, considering that it "went upon the face of the waters" for about five months. Assuming a cubit to be about 21 inches, its length was 525 feet, its breadth 87 feet 6 inches and its depth 52 feet 6 inches. Its length is thus seen to have been six times its breadth, which proportion is about an average of all types of vessels. Its draft of water must have varied greatly during the period of its occupation, as 12 months' provisions must have formed a very large proportion of the original weight, and these must have been gradually consumed. It had three decks; but was fitted with neither masts, sails nor rudder.

Ancient History.—The paintings and sculptures, as the early records of Egypt, show regularly formed boats constructed of sawed planks of timber, propelled by numerous rowers, and also by sails. These vessels were long galleys with one mast and a large square sail, which was sometimes of linen and sometimes of papyrus. The oldest authentic record as to these sailing vessels is the illustration of one of them used as a decoration on an Egyptian amphora (in the British Museum), judged by the best authorities to have been made about 6000 B.C. It is to be noted, however, that these boats could sail only with the wind, and that the science of tacking and sailing against the wind was unknown for, literally, thousands of

years, during which vessels sailed if the wind was favorable, and unshipped the mast, and set the oarsmen at work when it was contrary. The Hebrews in the time of Solomon must have possessed vessels of considerable size, as mention is made in the sacred writings of that date of stately ships, and of voyages made to bring trees of considerable size to be used in the building of the temple. The Phœnicians about 1200 B.C. had sailing vessels which did not differ in any important respect from those of the Egyptians, but they seem to have developed the art of sailing to a considerable degree. Later they were connected with the Hebrews in their maritime expeditions, and this people appear to have been the most enterprising in navigation of all the nations of antiquity. Herodotus tells us of their feat of circumnavigating the continent of Africa in 604 B.C. They started from the Red Sea, passing Ophir on east coast of Africa, then rounded the Cape, and keeping by the west shore they entered the Mediterranean Sea through the Straits of Gibraltar, and arrived in Egypt in the third year of their expedition. Little doubt exists of the Phœnicians having been the discoverers of the art of sailing, as their skill in evading Nebuchadnezzar at the siege of Tyre for 13 years shows that they possessed more than a superficial knowledge of navigation. They were also engaged in concert with other nations in wars with the Greeks; and it was from them the latter nation learned in their conflicts what they knew of ships and navigation. The fact of the Grecian mariners making use of the screw pump to discharge water from their vessels' holds would lead to the conclusion that their vessels were no mere sloops; yet the relative placidity of the waters in which they sailed suggests that their vessels were sailing boats rather than sailing ships. An evidence of the want of strength in the construction of these ancient vessels is the fact of their being bound around the outside with heavy ropes. They were sometimes carried as part of the vessel's outfit, and used as necessity required. Out at sea and in heavy weather, they were made use of. There were sometimes as many as 8 or 10 bands running fore and aft of the vessel. The Greek warships were strengthened to withstand the shock of ramming by the addition of longitudinal timbers secured to the exterior of the hull. At this period it was the custom of mariners to draw their fragile vessels out upon the shores at the approach of autumnal storms, and to leave them there till mild weather came again in the spring.

Roman Galleys.—The Romans in the early stage of their history paid little attention to navigation, until it was forced upon them by the necessity of competing with their rivals, the Carthaginians. The galleys of this period ranged from a single bank up to five banks of oars. The oars in these large galleys were arranged in sets or banks; the number of these could be increased to any extent by giving increased length to the galley. The trireme, or three-bank galley, appears to have been generally open, in the waist where the rowers sat, with decks or platforms at both ends for the soldiers. The galleys of greater size than the three tiers appear to have been always decked

vessels. At the time of the First Punic War the Roman fleet is said to have consisted of 330 vessels, each containing 300 rowers and 120 soldiers. The triremes were each 105 feet long and 11 feet wide, and the quadriremes were 125 feet by 13 feet.

Viking Ships.—Of much sturdier build were the ships of the Norsemen, designed to sail the turbulent waters of the northern seas. The custom of burying noted Vikings in the boats which they commanded has preserved under great burial mounds a number of specimens of these early ships. One of these, found in England, was 48 feet long, 9 feet 9 inches beam and 4 feet depth of hold. Another, unearthed in Norway, was 45 feet 6 inches in length, about 14 feet beam and 4 feet deep. The famous Gogstad ship, exhumed in 1880, was 79 feet 4 inches long, 16 feet 6 inches beam, 6 feet deep amidships and 8 feet 6 inches deep at bow and stern. All of these vessels were of oak, clinker-built and caulked with moss or hair of some animal. They have been decided by antiquaries to belong to the 3d century. The remains of a much larger vessel, prodigious for its time, were found in the Orkneys. It was 130 feet in length and had a depth of hold of about 15 feet. This vessel is regarded as belonging to the latter part of the 9th century, and is believed to have been one of the ships with which the Vikings conducted raids on the coast of England. These raids served to stir Alfred the Great (848-890) with a spirit of rivalry and he proceeded to build ships twice as large as those of the enemy, but of the same type. It is noteworthy, however, that he failed to find seamen of experience in his own kingdom, but was compelled to hire them in Holland. Under Athelston, the grandson of Alfred (895-941), it is known that a considerable merchant trade was carried on with France and Flanders by English sailing ships; and it is recorded in history that King Edgar (944-975) had a fleet of some 4,000 sailing ships stationed as a guard around the entire coast of Great Britain.

The expedition of Richard Cœur de Lion (1157-99) to the Holy Land led to the remodeling in some respects of the English sailing craft, through the adoption of some of the developments in construction of the ships of the Mediterranean, which were much larger as to hull, and carried taller masts and a larger area of sail. But these improvements in the English ships were chiefly those for warlike purposes and the more important features of the Mediterranean vessels seem to have been overlooked, or at least neglected, for they did not appear in the English ships until the 15th century.

Merchant Ships.—It is generally supposed that ships intended only for merchant purposes were first built by the Genoese, and that not until the beginning of the 14th century were sails first used by that people. The fishing boats were the small beginning from which sprang the sailers and the larger sail vessels of a later period. But it is an indisputable fact that long before this time ships of three decks and of 600 or 700 tons, of Italian build, were sailing the Mediterranean with both freight and passengers. In England, as early as 1344, many vessels of this character were in service. In the middle of the 15th century many large ves-

sels were built in England, but they were mostly naval vessels. Prior to this the compass had come into more general use, and it was now possible to engage in longer voyages. The discovery of America and the passage around the Cape of Good Hope were early fruits of these improvements. The Portuguese employed vessels of small size in their voyages of discovery, but the Spaniards built larger vessels and long maintained a superiority in this respect. England was far behind the Peninsular nations in commercial enterprise at the opening of the 16th century, but under the reign of Queen Elizabeth (1533-1609) the merchant marine of England was relieved of many oppressive laws and the coasting trade of the British Isles was reserved exclusively for British ships. And not only did the coasting trade flourish, but English shipping began to contest successfully with that of Italy, Spain and Portugal for the carrying trade of the world. Moreover, a distinct change appeared in the design of English ships in the abandonment of the high Spanish poop and forecastle prevalent on the vessels which sailed the Mediterranean. Meanwhile the French had not been idle, and while their merchant ships were few and small, they were building war vessels which compared well with those of Spain and England, though leaning in type toward the Spanish models. The *Corde-liere* of 700 tons and the *Grand Louise* of 790 tons were as large as any ships afloat.

The Spanish Armada, which visited English waters in 1588, comprised 130 sailing vessels of all sorts, with a total tonnage of 60,000. Some 60 of these were galleons of the largest type. The wrecking of one of them on the western coast showed it to be of 900 tons. At this time the "treasure-ships" of Spain, 100 feet in length and 34 feet in breadth, were making regular voyages across the Atlantic for the gold and silver of the New World. More light on the shipping of those days is afforded by the record of the carak *Madre de Dios*, captured by the English in 1592. This vessel was 165 feet in length, 46 feet 10 inches beam and drew 26 feet of water. The height of her mainmast was 121 feet and her main yard was 106 feet long. Her capacity was 1,600 tons, by far the largest known up to that time.

The Dutch ships of this period were distinctive in model owing to the shallow waters in which they sailed. They were low and of comparatively wide beam and large sail area. For their smaller craft the Dutch had already developed the fore and aft rig, and were using both the sprit sail and sprit topsail on their galleons. It is to be noted in passing that the Dutch galleons were at this time determinedly engaged in the first polar explorations on record—the endeavor to find a northeast passage to China (1594, 1595 and 1596). From the earliest times the Dutch had been fishermen and accomplished navigators, and while their war fleet was small, their merchant fleet grew apace and by the early part of the 17th century they controlled the coasting trade as far south as Portugal and were successfully monopolizing the East India trade of Britain. The English merchant marine was in a very depressed condition. Internal discords had put a damper on the enterprise of the merchants, and as the island was not yet famed for its manufactures,

commerce dropped with every disaster to trade. The British East Indies Company was formed under the auspices of Queen Elizabeth (1599) and some great ships were built for this trade, the largest being the *Trade's Increase* of 1,200 tons. From this time onward the British made every effort to control the shipping trade of the world. The Dutch were their principal competitors, and had, without doubt, the best-built and best-manned fleet and had established colonies in South America, to which their ships made regular voyages. The British policy was to build larger ships than those of any other nation and in this they surpassed the Dutch, but the French excelled them. The *Sovereign of the Seas*, built in 1637, was the largest of the British ships at this period. She was 170 feet long, 48 feet beam and 19 feet deep and measured 1,683 tons. The largest Dutch ships at that time were the *White Elephant* of 1,482 tons and the *Golden Lion* of 1,477 tons. The French had the *Soleil Royal* of 1,946 tons and the *Royal Louis* of 1,800 tons. The English continued to build larger vessels and in the early 18th century had the *Royal George* of 2,047 tons, and in 1765 launched the *Victory*, Nelson's famous flagship of 2,162 tons. The capture by the British in 1792 of the French *Commerce de Marseilles* of 2,747 tons aroused new emulation of the French shipbuilders, and the direct result of this impetus was the *Caledonia*, launched in 1808, a vessel 205 feet in length and of 2,616 tons.

The First American Ships.—This continent having been fitted by nature in supplying it with an abundance of good timber, vessels have been built upon our shores from the first year of actual settlement. The first ship constructed was for the purpose of carrying a small band of settlers back to England, who were discouraged with their prospects after the first winter. The vessel was built in 1607 at Stage Island, near the mouth of the Kennebec River in Maine. It was a staunch and excellent little vessel of 30 tons, a two-master, named *Virginia*. She is believed to have been about 30 feet long, 13 feet beam and 8 feet deep. She subsequently made a number of voyages between America and England. The next vessel built was at New York in 1614 by Capt. Adrien Blok, who had lost his ship *Tiger* by fire while lying in Manhattan River. His new vessel was named *Onrust* (*Restless*) and was 38 feet keel, 44½ feet long over all and 11 feet beam. This vessel was employed for several years in exploring the Atlantic Coast from the 38th to the 42d degree of latitude. Block Island was visited during one of the excursions and took its name from Adrien Blok. With the exception of fishing boats and shallops, there is no record of the construction of any other boats until 1631. In that year the 30-ton bark *Blessing of the Bay* was launched at Medford, Mass., for the use of the Massachusetts colony. In the course of the season this vessel made several coasting trips and soon after visited Manhattan Island and Long Island. It is thought the vessel was lost with a load of furs and fish in 1633 off the capes of Virginia. By 1635 there were six of these small sailing vessels regularly employed in the trade with England. In 1636 the *Desire* of 120 tons was built at Marblehead and put into the fishing business.

Early Shipbuilding.—Shipbuilding at this time appears to have received its impulse from the same cause which threw the colonists upon their own resources for the supply of many of the necessities of life. They had been hitherto supplied with all but their corn and fish by the many emigrant ships which had yearly added to their numbers. A suspension of this emigration, brought about by the civil wars in England, and the diminished intercourse caused thereby, left them dependent on mercantile enterprise alone, which the state of navigation then rendered precarious in the extreme. Governor Winthrop then said, "The general fear, of the want of foreign commodities, now our money was gone, and things were like to go well in England, set us on work to provide shipping of our own: for which end Mr. (Hugh) Peter, being a man of very public spirit and singular activity for all occasions, procured some to join for building a ship at Salem of 300 tons, and the inhabitants of Boston, stirred by his example, set upon the building of another at Boston of 150 tons. The work was hard to accomplish for want of money, etc., but our shipwrights were content to take such pay as the country could make." He speaks in another place of the *Trial* of 160 tons, as the first ship built at Boston. She sailed for Bilboa on 4 June 1642, laden with fish, "which she sold there at good rate, and from thence freighted to Malaga." Thus early began the profitable trade to distant ports from New England, and by 1676 the colony of Massachusetts owned 200 vessels of from 30 tons to 50 tons; 200 of from 50 tons to 100 tons, and 30 above 100 tons. An early and successful prosecution of the business of shipbuilding could have been more reasonably expected of none of the first colonists of America than of the settlers of Manhattan. Holland was at that period, and long after, in the enjoyment of the carrying trade of the world. Though not possessed of a foot of timber, she built and armed more ships than all the rest of Europe. Planted by this commercial people, and by merchants and capitalists of Amsterdam, then the mercantile metropolis of Europe, exclusively for the purposes of trade, it appears somewhat surprising that the facilities afforded by the new territory for shipbuilding were not made available to a greater extent by the parent nation. But the administration of a privileged mercantile association, such as the West India Company, which, in 1621, was invested with a monopoly of its trade, was unfavorable to the development of the resources of the colony. About 1630 the carrying trade between Holland and America, and the trade with Brazil, where the company had sustained losses equivalent to "one hundred tons of gold," were thrown open to the colonists and private ships were for the first time entered at Amsterdam and publicly advertised for New Netherlands. Other restrictions, which had fettered commerce, were soon after removed and the trade of the world with the exception of that to the East Indies, and the trade in furs, were open to the colonists. In 1678 the shipping owned in the port consisted of three ships and 15 sloops and other small sailing vessels. In 1694 the shipping had increased to 60 ships and 102 sloops. This was on account of a monopoly of exporting flour and biscuits from the

province. South of New York during colonial times there was little or no construction of vessels. New England developed her large shipping interests through the fisheries that were at her door and the coasting trade maintained by the latter extended as far south as the West Indies during these early days. It might be said the fisheries were the cause of the large merchant marine of New England. Between the years 1674 and 1714 a total of 1,332 vessels were registered as built in New England yards, in many cases by men drawn from English shipyards. Of those built, 239 were sold to foreign owners.

The Schooner.—In 1745 Andrew Robinson of Gloucester, Mass., built a vessel with a square stern, which was fitted with two masts, bearing a sloop sail on each, and a bowsprit with jib. She was sharp on the bottom and on being launched sped over the water so fast from the impetus gained by descending from the ways as to elicit from a bystander the remark, "See how she scoons." Scoon was a word used by plain people to express the skipping of a flat stone over the surface of the water when skilfully thrown; and the builder of the vessel, having been somewhat at a loss for a name for the new rig, seized upon the trifling incident and replied, "A scooner let her be," and two-masted vessels, with jibs, and fore and aft sails have since been called by that name. This vessel was probably used in the fisheries. The schooner proved to be a very economical vessel to run, with fewer men to her sail area than any other type of sailing vessel. The largest schooners were those sent to the Grand Banks, and for many years after 1800 about 70 sailing vessels were sent annually to the Grand Banks, chiefly from Cape Ann. These early vessels were from 20 to 40 tons.

Colonial Merchant Marine.—Before the Revolutionary War our merchant marine was in a prosperous condition and took nearly first rank with us. By 1760 from 300 to 400 trading vessels were being built annually in the different provinces. In 1769 alone, 389 ships with a tonnage exceeding in the aggregate 20,000 tons were turned out of American shipyards. Of these, 113 were square-rigged and a large proportion of the remainder were schooners. Few of these exceeded 200 tons. During the War of the Revolution the whaling and fishing fleets suffered seriously from raids by English cruisers. Foreign trade in our vessels suffered the same fate. A large part of the merchant and fishing fleet was employed during the war in privateering and it became a profitable field for them at times, as small armed sloops frequently captured large merchantmen under the British flag. The larger privateers built during the war, when the conflict was over, were converted into merchantmen and sent to the East Indies to trade. The Baltimore-built schooner took high rank as a privateer during the war. The 16 years that followed ending with the War of 1812 were perilous times for American shipping. England excluded us from a profitable trade with the British West Indies and the same interests led to the searching of our merchant vessels for British subjects, the capture and confiscation of our vessels and cargoes and a detention of a large number of them for evasions of the British law. The American merchant fleet which had increased to a total

registry of 848,307 tons in 1807 fell to 769,054 tons in 1808, under the restrictions of the American embargo laid at the insistence of Great Britain. The repeal of the embargo in 1809 brought the tonnage of the merchant fleet to 910,059 and in 1810 it reached its high-water mark for many decades to come at 984,269 tons. Then came on the War of 1812 that lasted for nearly three years, during which many privateers were constructed that subsequently pursued the peaceful pursuit of trade. A change in the form of our sailing vessels now began to appear, giving them better entrance lines, and cutting off those high poop decks that had been such a fixture on large vessels for many years.

The Carrying Trade.—Prior to the War of 1812 our coastwise trade was carried on by no larger sailing vessels than those that were schooner rigged, while our foreign trade was most largely carried on in foreign-built bottoms. Before 1812 a few sailing packets, or vessels carrying both passengers and freight, were brought into the transportation business, and cleared from port on regular days in each month, and were operated between special points only. At this time, however, there were many American-built whalers making three-year voyages to the Pacific from Massachusetts harbors and not a few had gone as far as Bering's Sea. The average tonnage of these daring vessels was less than 300 tons. When the war ended there were only a few small British ships in the packet service between England and America, and very few between America and other parts of the world. Soon after the peace, however, a large number of lines came into existence as a natural outgrowth of the rush of emigration from Europe to America, and the general expansion of ocean travel and trade. The carrying of passengers was a profitable business and there was considerable competition among shipping merchants to get the most business for their vessels. None but the best and finest vessels could be used in this trade and the old-fashioned freighting vessels with their small cabins and houses and poop decks, were subjected to many changes to adapt them to the passenger business. The merchants at most all our coastwise ports, from Portland, Me., to New Orleans, La., soon saw the advantage of these packets for our coastwise trade and regular established lines were soon in operation that remained as carriers until the coastwise steamship lines began operations in 1847, when these lines of sailing vessels gradually withdrew from business. In this trade brigs, schooners and barks were used, while in the foreign service ships and barks only were placed in service.

Packet Lines.—It was at New York the packet business between Europe and America mainly centred. There were lines from other ports, but New York was the pioneer, always kept the lead and had the largest number and finest vessels for the service. In 1816 Isaac Wright and Company of New York founded the famous Black Ball Line, so called from the round black circle in a white field, which was adopted as the pennant of the ships. There were at first four vessels in this line, each of 400 tons, and named *Pacific*, *Courier*, *Amity* and *James Monroe*. This line was subsequently owned by Goodhue and Company, Charles H.

Marshall and others, and a dozen other ships added, from 300 to 500 tons burden. They were placed in the Liverpool trade and sailed once a month at first and during the first nine years the average time in voyages to Liverpool was 23 days and for returning home 40 days, but one of the later ships, the *Canada*, the fastest of them all, once made the outward voyage in 15 days and 18 hours and held for a long time the average record of 19 days outward and 36 days homeward trips. A London line followed the Black Ball line and then a Havre line was started. In 1821 a second Liverpool line was established from New York by Byrnes, Trimble and Company, known as the Red Star line, consisting of the *Manhattan*, *Hercules*, *Panther* and *Meteor*, sailing once a month, and soon after Fish, Grinnell and Company, afterward Grinnell, Minturn and Company, founded the Swallow Tail line with four packets, making from New York at this time, one sailing for Liverpool each week. In 1830 the passenger fare in the cabin from Liverpool was \$180, including beds, bedding, wines and stores of every description. The London packets now sailed twice a month and the Havre line had three sailings a month. There were also at this time sailing packets to South America and Mexican ports. In 1830 there were 1,510 arrivals at New York from foreign ports, of which 382 were ships, 28 barks, 714 brigs, 376 schooners, 8 sloops, 1 ketch and 1 felucca. Of these, 1,366 were American, 92 British, 7 Spanish, 12 Swedish, 2 Hamburg, 5 French, 8 Bremen, 6 Haitian, 9 Danish, 2 Brazilian, 2 Dutch and 1 Portuguese. The number of arrivals in 1829 was 1,310, and passengers, 16,064. In 1823 John Griswold established a London line of four vessels, that had been increased by 1837 to 12 vessels. These vessels down to 1845 were one- or two-decked vessels, and had increased in size from 900 to 1,000 tons. The between deck space, aft, was divided into cabins for the passengers, the middle portion was fitted up with kitchens, pantries, etc. The steerage passengers and crew were placed forward. After 1830 there were frequent sailings of rival packets, transient, but all American, from Boston, New York, and Philadelphia to Great Britain and other parts of Europe. All the ships sailed with great speed and made the run across the Atlantic in excellent time. The *Red Jacket* once ran from New York to Liverpool in 13 days 11½ hours. The *Mary Whitebridge* made the voyage from Baltimore in 13 days 7 hours; but the usual time was 19, 20 or 21 days to Liverpool and from 30 to 35 days homeward. English steamers were sent out in 1838 and 1840 to compete with these packet lines; but the steamers did not at first make much better average time on a voyage than the packets, but in the course of a few years the increase in speed and their additional carrying capacity gave them an advantage and the packets could no longer successfully compete with them.

Clipper Ships.—After the packets came the clipper ships, vessels intended primarily for freighting, and built to secure the highest possible speed when laden with cargo. The packets were the fast sailers from 1816 to 1845, but after the latter date there grew up various branches of trade in which a quick delivery was as important for commercial purposes as it was

for the passenger trade. For instance, there was the tea trade from China to the United States, in which speed has always been considered essential. The cargoes consisted of teas, spices, coffee, dried fruits, etc., which were liable to deteriorate in a long voyage of four months to the home port, and to shorten the voyage as much as possible was desirable for many reasons. There were no telegraph lines and ocean cables in those days and the uncertainty of the markets made fast trips home from the East Indies very important. Merchants had repeatedly suffered heavy loss, sometimes business ruin by the decline in eastern goods brought home by ships during their absence on the voyage out and back, and good ships were, therefore, always required in that trade. The first clipper, the *Scottish Maid*, was built in 1839 in Great Britain. She was a schooner of 150 tons and proved very fast and continued in service for 50 years. The first American clippers were built at Boston and Medford. These were small schooners, the *Angola* of 90 tons and the *Zephyr* of 150 tons. They were used in the opium trade. The pioneer of the large clippers was the *Helena*, of 650 tons, whose dimensions were 135 feet length on deck, 30 feet 6 inch beam and 20 feet depth of hold, built by William H. Webb. She came out in 1841 and was constructed for A. and N. Griswold for the China trade. She was a good sea boat and a very fast sailer for her day, making many fast voyages between China and other East Indian countries and New York. Following the *Helena* came the *Rainbow* of 750 tons, built by Smith and Dimon in 1843 for Howland and Aspinwall. She was the first of the extremely sharp type and at the time was claimed by her captain to be the fastest ship in the world. Very few sailing ships since have equaled her records. This vessel made the voyage to Canton and return home in six months and 14 days, having spent three weeks of the time in loading and discharging cargo. The *Helena* and the *Rainbow* brought about a great change in this type of vessel. They commanded better prices for freights than sloop ships, and in every way proved desirable. Then in 1844 followed the *Montauk* of 540 tons for William S. Wetmore, built by William H. Webb. Then A. A. Low and Company had Brown and Bell construct for them the *Howqua* of 706 tons, a very fast and fine vessel, which made a voyage from Shanghai to New York in 84 days. The owners of the *Rainbow* then had the noted clipper *Sea Witch* of 907 tons, built by Smith and Dimon, with the intention to have the fastest vessel of the type afloat. This vessel had finer under water lines than her predecessors, and may be said to have been the first of that advanced type of fast clipper ships. She made one voyage to California in 97 days; to Hongkong in 104 days; to Valparaiso in 69 days; and returned from Canton to New York in 85 days. Her best 24 hours run was 358 miles, a speed greatly exceeding any steam vessel then existing. The era of fast clipper ships was now fairly inaugurated, and many of this class were now built not only at New York, but at Boston, Philadelphia and Baltimore. Nearly all the early ones did not exceed 1,000 tons register, or about 165 feet long, but competition led to

a great increase in size, and every year saw vessels launched that spread more and more canvas, longer, larger and faster than ever, and expressly intended to excel everything that had preceded them in the merchant shipping of the world. In 10 years after the first clipper ship the size of 2,400 tons was reached and there were many built 2,000 tons each.

British Rivalry.—Foreign merchants were by no means idle spectators of what was going on in this country, and in 1846 England began to awake to the new and dangerous rivalry from America. The arrival of the *Oriental*, 1,003 tons, in London in 1850, 97 days from Hongkong, with 1,600 tons of tea, on which she collected \$48,000 freight, created a furore. Not a single British ship was her equal in speed or elegance of line and construction. The British Admiralty sought and were given permission to draught her underwater lines in drydock; and a great impetus in the building of fast ships resulted. Alex. Hall and Company of Aberdeen made a specialty of clipper ships, and there were launched from their yard many superior and famous vessels. But the Americans, though hard pressed, were able to maintain the lead, and entitled to the best record ever made by ships sailing under canvas. There were several famous races home from China. Once the British clippers *Chrysolite* and *Stornaway* and the American clippers *Race Horse*, *Surprise* and *Challenge* engaged in a race from Canton to Liverpool and Deal and arrived at the home ports as follows: At Liverpool, *Chrysolite* in 106 days; at Deal, *Stornaway* in 109 days; *Challenge* in 105 days; *Surprise* in 106 days. The British ship *Challenge* ran from Shanghai to Deal in 113 days, and the American clipper *Nightingale* in 110 days. These races were claimed by both parties; but the Americans kept the reputation of superiority, and several ships were ordered at our shipyards for foreign account. Then shortly after the gold fever broke out in California, and the *John Bertram* of 1,100 tons was built at Boston, Mass., and sent to the Pacific Coast in 1850 by Boston parties. This was the first clipper ship built for the California trade. The *Witch of the Wave* and four others of 1,500 tons each were immediately after built for the same parties. The *Witch of the Wave* made the trip from Canton to Deal in 90 days—15 days faster than the best previous record, that of the *Challenge*.

Sailing Speed.—The speed of the clippers was remarkable. Six miles an hour was a good average rate of speed for long voyages and nine miles an hour excellent time, especially for a ship loaded with a full cargo of merchandise. Clippers ran across the Atlantic to Liverpool at an average speed of nine miles an hour, spurting at the rate of from 10 to 13 miles with a favorable wind, and on voyages that gave them the advantage of the trade winds they ran for days and weeks in succession at an average speed of from 12 to 15 miles an hour. To sail 300 miles a day was not exceptional. The largest of them all was the four-master *Great Republic*, of 4,555 tons, built by Donald McKay in 1853 at East Boston. The length on load line was 314 feet, beam molded 49¼ feet, molded depth 32 feet. She was burned at her dock before sailing. The hull was afterward rebuilt at Greenpoint, L. I., and

was launched at 3,357 tons, being still the largest ship afloat. One of the noted clippers of the day was the *Dreadnought* built in 1853 at Newburyport, Mass. In 1859 she made the voyage from Sandy Hook to Liverpool in 13 days, 8 hours. Fast as the *Dreadnought* was she failed to surpass the records of the *Red Jacket*, a Maine-built clipper of 2,006 tons, of 13 days, 1 hour from Sandy Hook to the Rock Light, Liverpool (1854), and of the *Andrew Jackson*, built at Mystic, Conn., of 1,679 tons, holding the record for the west-bound voyage, 15 days from Rock Light to Sandy Hook (1860).

Other record passages of those days which have never since been beaten are the following:

James Baines, 2,515 tons, launched at East Boston in 1854; 12 days, 6 hours, Boston to Liverpool. From Liverpool to Melbourne in the then record time of 63 days; and thence home to Boston in 69 days; making the circuit of the globe in the unequalled time of 132 days.

Lightning, American-built ship of 2,090 tons, Melbourne to Liverpool, 63 days (1853); Portsmouth to Calcutta, 87 days (1857).

North Wind, American built, 1,041 tons, London to Sidney, New South Wales, 67 days.

Mandarin, 776 tons, New York to Melbourne, 71 days.

Mary Whitridge, American built, 987 tons, Liverpool to Baltimore, 14 days, 9 hours (1855).

Marco Polo, American built, 1,512 tons, Liverpool to Melbourne, 61 days (1861).

Thermopylae, British built, 927 tons, London to Melbourne, 60 days (1869).

The record voyages of American sailing ships in the coastwise trade, known as the "California clippers," were:

Flying Cloud, 1,793 tons, New York to San Francisco, 89 days (1851). The same feat was accomplished in 1854 by the same vessel and repeated in 1860 by the *Andrew Jackson*.

Northern Light, 1,021 tons, San Francisco to Boston Light, 76 days, 5 hours (1853).

Comet, 1,836 tons, San Francisco to New York, 76 days (1854).

The best day's run ever made by a sailing ship was 436 nautical miles, recorded by the *Lightning* on her maiden voyage from Boston to Liverpool in 1854. The highest speed ever recorded by a sailing ship was 21 nautical miles per hour, made by the *James Baines* on 17 June 1856.

After 1860 there was no longer any necessity for great size and speed in this type of vessel. Too many ships had been built and a reaction set in that lasted for many years. By 1857 there were from 80 to 100 large ships in the California trade and the rates of freight fell off one-half, and the ships were thrown into the general trade of the world. In the next place, steam vessels, about 1852, had been built to run on all the principal ocean routes and there was no longer any need for sailing vessels to be fitted out with large cabins and roomy passenger accommodations. This ended the career of those fast clipper ships that had such a world-wide reputation from 1850 to 1860. Then the Civil War came on and our foreign trade was cut off for four years. After 1865 the grain trade attracted the larger sailing vessels from all over the world. This type of vessel was no longer an extreme clipper of the former

period, but a handsome, medium clipper of from 1,400 tons for the British ships to 1,600 and up to 2,000 tons register, for the American; capable of carrying a large cargo at a fair rate of speed. The Maine shipyards at this time turned out a large number of strong wooden sailing ships of from 1,600 to 2,400 tons. These vessels continued in the Atlantic-Pacific trade until the American Hawaiian Steamship Line commenced operations in 1900.

Modern Schooners.—The schooner, as previously mentioned, was a distinctively American product of a comparatively early date (1713). It was largely used in the coastwise trade, to the West Indies, to South America and later to Africa, and it may be said has not fallen from favor even to this day. The early vessels were not over on an average 75 tons. When it became necessary to increase the tonnage of the vessel it was thought to be advantageous to increase the power, so three masts were adopted. The earliest date of the building of a three-masted schooner in this country is thought to be about 1831. There were a few more built about 1845, and in 1847 the *Midas* was converted into a three-masted schooner, the *Zachary Taylor* was built at Philadelphia in 1849 and the *Spray* at Wilmington, Del., the same year. The period when this type of sailing vessel had passed the experimental stage appears to have been in 1853 when there were built the *Gardner Pike*, the *James H. Chadbourne*, the *Kate Brigham* and the *E. R. Bennett*; and in 1855 the *Eckford Webb* and the *William L. Burroughs*; and in 1856 the *Hartstein* and the *Cordelia*. The two latter were two-decked vessels and were the largest of the type built for some years. These vessels were used mainly in our coasting trade, as far south as the Gulf of Mexico ports. There were a few more built prior to 1860; the Civil War came on when but few, if any, were built. It was 1868 before three-masted schooners were again constructed, and by 1873 they were the most popular type of our coastwise sailing vessels. The first four-masted schooner was the *William L. White*, built at Bath, Me., and completed in June 1880. The Northern lakes also had four-masters immediately after the *William L. White*. Then it was some years before the pioneer five-master was constructed in 1888 at Waldoboro, Me., as the *Governor Ames*. The latter was the largest schooner for 12 years, until the *George W. Wells* was built in 1900 as a six-masted schooner. The largest of them all was the *Thomas W. Lawson*, built of steel in 1902, as a seven-masted schooner. This superb vessel foundered off the Scilly Islands in 1907.

Iron Hull Ships.—Although iron had been used in Great Britain for building hulls as far back as 1829 and came into common use in the early 40's, the first iron hull sailing vessel constructed in the United States was the schooner *Mahlon Betts* of 275 tons, built in 1854 at Wilmington, Del. Then there were none but wooden sailing vessels until the brig *Novelty* was built at Boston, Mass., in 1868, and the bark *Iron Age* constructed in 1869 for Tupper and Beattie of New York. The sloop yacht *Vindex* was then built in 1871 at Chester, Pa., by Reanie Son and Archibold; and in 1879 the yacht *Mischief* was built at Wilmington, Del.

The three-masted schooner *Josephine* followed in 1880, being built by William Cramp and Sons Company. Then there came much larger vessels in the *Tillie E. Starbuck*, built in 1883 by John Roach and Son at Chester, Pa.; and in the same year by Gorringer and Company, as the American Shipbuilding Company, the *T. F. Oakes*. These vessels were about 2,000 tons register each.

The world's recorded tonnage of merchant sailing vessels in 1850 totaled 7,701,885; of which 3,396,650 tons were British; 3,009,507 tons American; 674,228 tons French; 298,315 tons Norwegian; 289,870 Dutch, and 33,315 Belgian.

In 1900, with more complete records, the total was 9,167,620, distributed thus: United States, 2,507,042 tons; United Kingdom, 2,096,408 tons; Norway, 1,002,675 tons; France, 636,081 tons; Germany, 593,770 tons; Italy, 568,164 tons; Japan, 320,572 tons; Sweden, 288,687 tons; Finland, 287,154 tons; Russia, 269,460 tons; Greece, 175,867 tons; Denmark, 158,303 tons; Spain, 95,187 tons; Holland, 78,493 tons; Portugal, 43,874 tons; Austria-Hungary, 25,342 tons; China, 20,541 tons.

In 1911, the latest year for which complete figures are available, the total of the merchant sailing marine was 7,454,189 tons, distributed as follows: United States, 2,564,721 tons; United Kingdom, 962,718 tons; Norway, 738,197 tons; France, 624,521 tons; Germany, 510,059 tons; Japan, 451,529 tons; Italy, 410,791 tons; Finland, 327,625 tons; Russia, 254,330 tons; Sweden, 154,968 tons; Greece (1910), 145,284 tons; Denmark, 124,510 tons; Spain, 44,325 tons; Portugal, 43,844 tons; Holland, 42,312 tons; Austria-Hungary, 32,871 tons; China, 15,679 tons.

A comparison of decades shows that the zenith figures of the sailing fleets of the several maritime nations were as follows: United States, 1861, 4,662,669 tons; United Kingdom, 1870, 4,577,855 tons; Norway, 1890, 1,502,594 tons; Italy, 1870, 980,054 tons; Germany, 1880, 965,767 tons; France, 1860, 928,000 tons; Sweden, 1880, 461,593 tons; Holland, 1860, 423,790 tons; Greece, 1870, 398,703 tons; Russia, 1880, 378,894 tons; Finland, 1911, 327,625 tons; Spain, 1880, 326,438 tons; Austria-Hungary, 1870, 279,400 tons; Denmark, 1880, 197,509 tons; Portugal, 1900, 57,925 tons; Belgium, 1850, 33,315 tons.

A comparison of these figures will give a measurably accurate view of the rise and fall of the sailing vessel in the principal maritime countries.

In the United States the zenith of the building of sailing ships was reached in 1855, when 1,781 vessels, aggregating 510,690 tons, were launched. Of these, 381 were ships, 126 were brigs, 605 were schooners and 669 were sloops.

On 30 June 1917 there were on the register of the United States 134 square-rigged vessels; 82 of these being American built and 52 built abroad. These were 38 ships totaling 77,863 tons; 55 barks, totaling 68,993 tons; 38 barkentines, totaling 37,987 tons, and 3 brigs and brigantines, totaling 940 tons. The materials of which these vessels were built were: Of wood, 81; of iron, 28; of steel, 25.

The sailing vessels of the world, of 50 tons and upward in the year ended 30 June 1917,

THE FIRST SEVEN-MASTED STEEL SCHOONER

Length, 395 feet; Beam, 50 feet; Molded Depth, 34 feet 5 inches; Displacement, 10,000 tons; Cargo capacity, 7,500 tons; Total sail area, 40,617 square feet

were recorded by the Bureau Veritas as 19,985 in number and of the aggregate of 4,731,707 tons. Of the whole number, 4,975 were British; 3,554 Russian; 1,851 American; 1,493 Japanese; 1,103 German; 963 Turkish; 949 Italian; 901 Swedish; 775 French; 734 Norwegian; 634 Danish, and 585 Greek. By far the largest number are of wood.

In 1914 (the latest figures available) only 35 sailing vessels, 9,195 tons in all, were launched in British shipyards. In the United States 21 were launched, 4 of steel; totaling 3,262 tons; and 17 of wood, totaling 14,934 tons. The entire output of sailing vessels for the world in 1914 was 225 craft, aggregating 67,368 tons.

J. H. MORRISON,

Author of 'History of American Steam Navigation.'

SAILOR'S CHOICE, the name of several excellent food fishes taken on the eastern and southeastern coasts of the United States, which are of small size and belong to the family of grunners. The best known, probably, is *Orthopristis chrysopterus*, also called pigfish, and especially common in the Gulf of Mexico. It is regarded as the best pan-fish of the region.

SAILOR'S CREEK, Battle of, the last great battle of the Civil War in the East. Sheridan says that it was "one of the severest conflicts of the war . . . so overshadowed by the stirring events of the surrender, three days later, that the battle has never been accorded the prominence it deserves." When General Lee abandoned Richmond and Petersburg on the night of 2 April 1865, he ordered the concentration of his army at Amelia Court House, about 30 miles west of Petersburg, and it had collected at that point by noon of the 5th. On the night of the 5th Sheridan's cavalry and the Second, Fifth and Sixth corps of the army of the Potomac were at or near Jetersville, under orders to march early next morning on Amelia Court House. General Meade began the advance at 8.30 A.M., and when four miles out of Jetersville, Humphreys' Second corps, on the left, discovered that Lee was moving westward, passing by the flank of the Union army. The advance on Amelia Court House was suspended, and the army faced about; the Second corps was ordered to move on Deatonville; the Fifth through Painesville, on the right of the Second; and the Sixth through Jetersville to the left of the Second. Sheridan's cavalry moved on the extreme left parallel to the Confederate line of

retreat, impeding the march of the column wherever practicable, but Longstreet's corps succeeded in reaching Rice's Station, on the Lynchburg road, where he awaited the corps of R. H. Anderson, Ewell and John B. Gordon, the last-named commanding the rear-guard. The Second corps was checked at Flat Creek by the destruction of the bridge, but, soon repairing it, overtook Gordon and kept up a running fight with him for 14 miles, carrying several lightly intrenched positions, and capturing prisoners, colors, and wagons. The pursuit continued to Parkinson's Mill, on Sailor's Creek, where Gordon made a stand, but was soon driven across the creek, losing three guns, 13 colors, several hundred prisoners, and a large part of the trains of Lee's army. He attempted another stand beyond the creek, but fell back as Humphreys crossed, and marched for High Bridge. Pursuit ended at night. During the day the Second corps had captured 1,700 prisoners, four guns, 13 colors, and several hundred wagons and ambulances. While the Second corps was engaging Gordon, the Sixth corps, with the cavalry commands of Merritt and Crook, had come up some three miles to the left and overthrown the corps of R. H. Anderson and Ewell. Custer's division had interposed between Ewell and Gordon, destroying 400 wagons and taking prisoners and 16 guns; and Crook, moving rapidly to the left, found R. H. Anderson's command posted on high ground behind breastworks running across the Rice's Station road, and sent a dismounted brigade to take possession of and form across the road, thus cutting Anderson off from Longstreet. Ewell now proposed to Anderson that they make their way through the woods, around Sheridan's left, and get to Longstreet; but before anything could be done both were attacked. The Sixth corps had opened its artillery upon Ewell's 3,600 men, to which there was no reply, as Ewell was without artillery; and about 5 P.M. two divisions advanced, crossed Sailor's Creek, and attacked Ewell, who made a most determined resistance and, massing his troops, broke the centre of the Union line, but was checked by the artillery-fire from beyond the creek. The two divisions of the Sixth corps—Seymour's and Wheaton's—wheeled to the left and right respectively, enveloping Ewell's flanks; Stagg's cavalry brigade charged his right; and at the same time Merritt's and Crook's cavalry charged and routed R. H. Anderson's 6,300 men, killing wounding and capturing about 2,600. Ewell, now completely cut off and surrounded, surrendered his entire command. About 250 men of Kershaw's division, serving with him, escaped. Seven general officers were included in the surrender. The total loss of Lee's army was not less than 8,000 men. The Union loss did not exceed 900. Longstreet, who had remained at Rice's Station during the day, waiting for Anderson, Ewell and Gordon to unite with him, marched as soon as night set in, with Fields', Heth's and Wilcox's divisions, for Farmville. (See **FARMVILLE AND HIGH BRIDGE**). E. A. CARMAN.

SAILORS' SNUG HARBOR, a home for aged sailors on Staten Island, N. Y., established by Captain Richard Randall in 1800. The home is under government supervision and is in charge of a naval commander.

SAINFOIN, sän'foin, or **ESPARSETTE**, a leguminous plant (*Onobrychis sativa*), originating in the Mediterranean countries and cultivated for centuries. The stem is about two feet high, with pinnate leaves composed of small leaflets. The pea-like flowers are rather large and of a showy pink color, and are disposed in short spikes, on long axillary peduncles. It is nutritious fodder, well liked by livestock, especially sheep. It makes good hay, and will grow on light, warm, chalky soils, where other pasturage does not thrive; the roots are long-lived and are useful for binding light soils, while the foliage not only shades the pastures, but makes a good crop for plowing under. It is also recommended as a honey-producing plant for bee pastures.

SAINT, a person eminent for piety and other virtues. In the books of Scripture, both the Old and the New Testament, the whole body of the faithful people are called saints (2 Chron. vi. 41; Ps. xxxi, 3; Hebr. xiii, 14, "Salute all the saints"; Eph. i, 1, "the saints at Ephesus.") It is customary to give the title saint to all the apostles, evangelists and other holy persons, men and women, named in the New Testament, to most of the Fathers of the Church, to all the martyrs. In the Church of Rome the title of saint is formally and authoritatively bestowed on servants of God who in their lifetime were eminent for their Christian virtues and graces, and whose sanctity has been proved by miracles after their death (see **CANONIZATION**; **BEATIFICATION**); but thousands of saints are honored by that church, who lived in early times before the process of canonization was thought of. Intercession by the saints in heaven and invocation of the saints are articles of belief in the Catholic Church, Eastern and Western, as also in the schismatical Eastern churches: but that doctrine is repudiated by all the Protestant churches. The teaching of the Church of Rome, as proclaimed by the Council of Trent, is that the saints reigning with Christ "offer to God their prayers on behalf of men"; that it is good and useful "to call upon them with supplication," and, in order to obtain benefits from God through Jesus Christ, "to have recourse to their prayers, help and aid." Here the Church's doctrine regarding both intercession and invocation of saints is defined. Catholic divines find full warrant for this belief in the Christian sacred books; for the doctrine of intercession, in 1 Cor. xii, 12, where the unity of the Christian society is enforced; in James v, 16, where the prayer of the righteous is lauded; in Eph. vi, 18, and 1 Tim. ii, 1, where Saint Paul sets such store on the prayers of his fellow Christians; and it is asked: Can it be that the souls which have gone to God no longer exercise this kind of charity for their brethren on earth? If Scripture were silent on this question, the practice of the Church in all ages would suffice to remove all doubt as to the Apostolic origin of the belief in the intercession of saints. For the doctrine of the invocation of saints, theologians quote the word of Jesus Christ, that the

angels in heaven rejoice when a sinner repents of his sin (Luke xv, 7). It were superfluous to cite the usage of the Catholic Church regarding invocation of saints: it began with the beginning of Christianity itself.

SAINT, The ('Der Heilige'). 'The Saint,' by Conrad F. Meyer (1879), is a short novel, about the length of 'Silas Marner,' centred around the great quarrel between Henry II and his Chancellor and Primate of England, Thomas Becket. In a broad sense based on history, its psychology is fancifully developed from a mediæval legend found by Meyer in 1853 in Thierry's 'Conquest of England' (Book IX), according to which Becket was the son of an Englishman and of the sister of the Kalif of Cordova. The story of Henry's amours with beautiful Rosamond Clifford in the hidden bower suggested the secret palace in which Meyer's Becket rears his daughter Grace to save her from royal lechery. The accidental slaying of Grace after her seduction by the king inspires in Becket a deep-laid plot for revenge under the veil of pretended loyalty and later of saintly devotion when he becomes Primate on Henry's nomination, whereby he drives the king to alternate fits of despair and fury over the loss of political advantages and of the love of his queen and sons. The tragic ending is historical.

The story is put in the mouth of a Swiss Bowman, who is supposed to have come on his wanderings to London, where he entered the service of the king and was a minor actor in all the events he relates. The style is vivid, swift and powerful, and the diction of wonderful force and color, suggestive of a Gobelin tapestry, or as Keller said, "brocade." It is Meyer's most finished production, possibly his best. The English reader will find it curious to compare it with Tennyson's 'Becket.' Consult 'Der Heilige' (66th ed., Leipzig 1913); American School Edition (ed. Eggert, New York 1907, with critical introduction); Frey, Adolf, 'Conrad Ferdinand Meyer' (Stuttgart 1900); Credner, Karl, 'C. F. Meyer, Der Heilige' (Berlin 1899); Langmesser, 'K. F. Meyer' (Berlin 1905).

CARL E. EGGERT.

SAINT ACHEUL, France, archæological site near Amiens which has given the name *acheulian* to the paleolithic deposits discovered there, containing flint implements evidencing human industry at a time corresponding to the second glacial period in France.

SAINT ALBANS, ăl'banz, England, in Hertfordshire, 20 miles northwest of London, an ancient borough and market-town, standing on a height above the river Ver. Its abbey is one of the most remarkable Christian temples in England. Only a gateway remains of the original abbey, built in 793 in honor of Saint Alban, the first British Christian martyr. The present abbey has been so often extended and altered that it represents in its architecture many styles and various epochs of history, from the time of the Romans to that of Henry VII. It has the form of a Latin cross, with a length of 547 feet and breadth of 206 feet. Its tower has an elevation of 146 feet, crowned with battlements. Other churches are Saint Michael's, 10th century; Saint Stephen's, with some good Norman features, and Saint Peter's,

whose nave is of the Early Perpendicular. There is an Edward VI grammar school, and of modern buildings those deserving notice are the corn exchange, courthouse, prison, baths and public library, besides benevolent institutions, including hospitals and almshouses. The chief industries are silk manufacture, straw-plaiting, and there are breweries and iron foundries. Two battles were fought between the houses of York and Lancaster near Saint Albans; in that of 1455 Richard, Duke of York, defeated Henry VI, and in 1461 Margaret of Anjou defeated the army of York, commanded by Warwick. Southwest of the present city stood the ancient Verulamium, one of the oldest towns in Britain, on Watling street. In the abbey the printing press was set up on which the first English translation of the Bible was printed. Nicholas Breakspear, the only English Pope, was born near Saint Albans. Pop. about 17,000.

SAINT ALBANS, Vt., city, county-seat of Franklin County, on the Central Vermont Railroad, in the northwestern part of the State, about 45 miles north-northwest of Montpelier, the State capital, and three miles from Lake Champlain. It was settled in 1763 and chartered as a city in 1897. In 1864 the town was raided by a band of Confederates who entered the United States from Canada. In 1866 a number of Fenians, who were planning an invasion of Canada, made Saint Albans their headquarters. The city is on a plain about 390 feet above sea-level and 373 feet above lake-level. The scenery is most pleasing; to the east are the Green Mountains, and on the west may be seen the Adirondacks. The city is in an agricultural region in which considerable attention is given to dairying. The chief manufacturing establishments are creameries, railroad shops, machine shops and flour and grist mills. There are large shipments of farm and dairy products. Saint Albans contains the Warner Hospital, the Warner Home, Villa Barlow Convent, an academy; Saint Mary's Academy, public and parish elementary schools and a public library. Pop. 6,500.

SAINT ALBANS, W. Va., city situated at the confluence of the Coal and Kanawha rivers, 12 miles from Charleston, Kanawha County, on the Chesapeake and Ohio, the Coal River and the Kanawha and Michigan railroads. It is situated in a great natural gas field. The city has lumber factories, a large chemical plant, electrical supply factory, powder plant and projectile and armor plants. The two local banks have combined capital of \$55,000 and a combined surplus of \$30,000. The value of taxable property is about \$2,500,000. The chief public buildings are the city hall, Presbyterian, Northern Methodist, Southern Methodist, Baptist and Episcopal churches. There are graded schools and a high school, also churches and schools for negroes. Under the revised charter of 1917 the government is vested in a mayor and six councilmen. The annual receipts are about \$155,000. Saint Albans is the oldest town in the Kanawha Valley, numbering Daniel Boone among its first residents. War industries in 1917-18 increased the population temporarily about 50 per cent. Pop. 3,500.

SAINT ALBANS, Confederate Raid on, a foray made 19 Oct. 1864, when Lieut. Bennett

H. Young, with about 25 Confederates, nearly all of them escaped prisoners, armed with revolvers and carrying chemical preparations with which to set fire to town and farm-houses, crossed the Canada line into the town intending to burn it and rob the banks. Several citizens were killed or wounded, and three banks robbed of more than \$200,000. An attempt to burn the town failed because of the defective character of the chemical preparations. Young and his party remained in town less than an hour, when they rode back to Canada on horses they had seized. Pursuit was made by United States troops, who captured some of the men on Canadian soil and turned them over to the authorities, by whom they were released on the technical ground of want of jurisdiction.

SAINT ANDREWS, ăn'drooz, Scotland, an ancient city of Fifeshire, on the North Sea, 11 miles southeast of Dundee and 31 miles northeast of Edinburgh. It was created a royal burgh by David I in 1124, and after having been an episcopal see became an archiepiscopal see in 1472; it was long the ecclesiastical capital of Scotland. The ruined cathedral was begun in 1160 and took 157 years to finish. The old castle, also in ruins, was founded about 1200 and rebuilt in the 14th century; in it James III was born, Cardinal Beaton assassinated, and in front of it George Wishart was burned. Saint Andrews was a celebrated educational centre as early as 1120; its university, the first in Scotland, dates from 1411; it consists of the united colleges of Saint Salvator and Saint Leonard and the college of Saint Mary, both at Saint Andrews, and embraces also University College, Dundee, founded in 1880. The united college of Saint Salvator and Saint Leonard has a principal (also principal of the university) and 11 professors, and the college of Saint Mary has a principal and three professors. Degrees, open to women as well as men, are conferred in arts, divinity, science, medicine and law, much as in the other Scottish universities; and the university also confers the diploma and title of L.L.A. (Lady Literate in Arts). The number of students is about 250. In connection with the university is a library containing about 100,000 printed volumes and 150 manuscripts. The university unites with that of Edinburgh in sending a member to Parliament. Madras College or Academy, founded by Dr. Bell of Madras, the principal secondary school of the place, provides accommodation for upward of 1,500 scholars. Saint Andrews is a popular watering place and summer resort and the headquarters of Scottish golf, its links being famous. The manufacture of golf clubs and balls is a thriving industry.

SAINT ANDREW'S CROSS. See CROSS.

SAINT ANGELO CASTLE, Rome, Italy, a famous fortress situated on the right bank of the Tiber in the northwestern part of the city, opposite the bridge of Saint Angelo and a short distance from the main buildings of the Vatican. It was built by the Emperor Hadrian as a tomb for himself and his family. Originally it was a round stone tower covered with marble and surmounted by a number of statues, which, together with the marble covering, have disappeared, leaving the bare stone structure. When the Goths besieged Rome it was used

as a fortress, and has served this purpose ever since, being held and garrisoned by the party in power in the city. Since the time of Innocent III it has belonged to the Popes, who strengthened the fortifications with outworks and connected the castle with the Vatican by an underground passage.

SAINT-ARNAUD, sǎn-tār-nō, **Jacques Leroy de**, French soldier: b. Bordeaux, France, 20 Aug. 1796; d. at sea, 29 Sept. 1854. He entered the French army in 1813, but in 1822-31 was engaged with the Greeks in their struggle for independence. He returned to the French army in 1831, and in 1837 he went to Algeria, where he rose to the rank of *maréchal-de-camp* in 1847, and general of division in 1851, in recognition of his successful warfare against the Kabyle tribes. He was appointed Minister of War 26 Oct. 1851, was active in promoting the *coup d'état* of 2 December, and was made a marshal of France in that month. He was placed in command of the French forces in the Crimean War and co-operated with Lord Raglan at the battle of Alma, 20 Sept. 1854. Consult *Duperrel Sainte-Marie*, 'M. le Général Leroy de Saint-Arnaud' (1852).

SAINT ASAPH, ǎz'af, Wales, an episcopal city in the county of Flint, six miles southeast of Rhyl, occupies an eminence in the Vale of Clwyd, near the confluence of the Clwyd and Elwy. It is built irregularly and has a venerable appearance. The encampment, Bron-y-Wylva, on the brow of the hill, is supposed to have been occupied by Roman forces. The cathedral, a small plain structure, dating from 1284, has been restored several times. Its library contains some rare and valuable books. The bishop's palace is modern. The town has a grammar school, founded 1600, county offices, a union workhouse and almshouses. Pop. about 7,000.

SAINT AUBAIN, sǎn-tō-bǎn, **Andreas Nicolai de**, Danish author, known largely by his pseudonym, 'KARL BERNHARD': b. Copenhagen, 18 Nov. 1798; d. there, 25 Nov. 1865. He first appeared in literature as a contributor to the *Flyvende Post*, and finally obtained a large measure of success by his works of fiction, of which several dealt with higher Danish circles in modern times, while others were drawn from events of Danish history. Among the titles are 'Lykkens Yndling' ('Fortune's Favorite'); 'Krøniker fra Christian den Andens Tid' ('Chronicles from the Time of Christian II,' 1847), and 'Krøniker fra Erik of Pomerens Tid' ('Chronicles from the Time of Erik of Pomerania,' 1850). A collection of his writings appeared at Copenhagen in 1856-66 (2d ed., 1869-71).

SAINT AUBYN, ō'bīn, **Alan**, pseudonym of FRANCES MARSHALL BRIDGES, English novelist: b. Surrey. She was the daughter of G. B. Bridges, a dramatist, and was married to Matthew Marshall of Saint Aubyns, Tiverton, Devonshire. Among her very numerous novels may be named 'The Master of St. Benedicts'; 'Broken Lights'; 'A Prick of Conscience'; 'The Junior Dean.' She has also written many juvenile tales such as 'Joseph and His Little Coat'; 'The Dean's Little Daughter'; 'Wapping Old Stairs.'

SAINT AUGUSTINE, ā'gūs-tēn or ā-gūs'-lēn, Fla., city, port of entry, county-seat of

Saint Johns County, on the Atlantic Coast, about 38 miles south of the mouth of the Saint Johns River. The city is in lat. 29° 48' 30" N., and long. 81° 35' W., on a peninsula formed by the Saint Sebastian River on the south and west and the Matanzas River on the east. It is on the Florida East Coast Railroad and the East Coast Canal. It is the oldest city in the United States, although not with a continuous existence, the latter honor belonging to Albany, N. Y. The city has many evidences of its ancient fortifications. The residence of the old Spanish governors is now a custom-house and post office. The principal streets extend north and south. The main thoroughfare, Saint George street, only 17 feet wide, extends through the centre of the city to the city gateway; but beyond this point it is called San Marco avenue. Treasury street, which crosses Saint George, is only seven feet wide at the east end. Of the modern buildings, the hotels are the most beautiful. The Ponce de Leon is of the style of the Spanish Renaissance; the buildings and furnishings cost about \$3,000,000. A pictorial history of Spanish adventure in the New World, especially relating to the history of Florida, is given in the mural decorations of the dining-room and loggia.

Saint Augustine was settled 8 Sept. 1565 by Spaniards under Pedro Menendez de Aviles; but the place had been visited as early as 1512 by Ponce de Leon. For two centuries it remained under Spanish rule, although in 1586 it was plundered by Drake. The population in 1763 was 3,000, besides the garrison of 2,500. It became a British possession in 1763 which it remained until 1783. During the Revolution it was an important military depot. It became again a Spanish possession in 1783 and in 1821 it was ceded to the United States. (See FLORIDA). It was twice taken by the Federals during the Civil War. A disastrous fire in 1914 destroyed many of the city's famous landmarks. Some of the old buildings of the first Spanish régime are still in existence. The houses were then built chiefly of coquina, a formation found on Anastasia Island, a concrete made of broken shells cemented with shell-lime. The sea-wall, the city walls and the fort were made of the same material. San Marco, now Fort Marion, is a fine specimen of the knowledge of military engineering of that age. The government added a water battery in 1842-43, and has made occasional repairs, but it stands to-day about as built by the Spaniards. It is said to have been constructed by Mexican convicts and Indian prisoners, and to have been in process of erection for about 100 years. The shaft of marble in the Plaza was erected in 1812-13 to commemorate the adoption of a Spanish constitution which was more liberal than the one under which the city had been governed. The inhabitants were ordered to destroy the shaft when the project failed, but the authorities only removed the tablets which have since been restored. A Roman Catholic Church begun in 1793 and used later as a cathedral, was burned in 1887; but the façade remained almost uninjured. In rebuilding, this front wall was incorporated into the new structure; and the bell bearing the date of 1682 is also preserved. The only part of the old wall which now remains is the city gateway with about 30 feet of the wall on each side. The wall extended south along

SAINT AUGUSTINE, FLORIDA

2 The Plaza

San Sebastian River, and from the river to the castle of San Marco (Fort Marion) where were a wall and moat. The old city extended nearly a mile, from the Castle of San Marco to the Franciscan Convent, now Saint Francis barracks, and the old sea-wall, built to protect the city from the sea, was also limited by the castle and the convent. The government rebuilt the sea-wall in 1837-43, and there is now a granite coping three feet in width. For many years, until 1817, the entrance to the city from the mainland was by means of a drawbridge. Farming, dairying and stock-raising are extensively carried on in the vicinity.

There are a number of manufacturing industries; chief among the establishments are the Florida East Coast railroad shops, printing plant, lumber and wood works. There are engaged in oyster canning and in fishing fully 250 persons. Saint Augustine is a famous winter resort; about 25,000 persons visit the city annually. Two fine hospitals, the Alicia and the Florida East Coast, the public library, the State School for Deaf and Blind, several churches, and the municipal buildings are among the principal structures. The educational institutions are Saint Joseph's Academy, Warden Academy (colored), three public schools (white), two parish schools (white), one parish school (colored), one kindergarten and one of the 17 best libraries in the United States, entitled to all government publications free, and a museum of natural history. The one bank has a capital of \$100,000; the annual amount of business is about \$1,100,000. The waterworks are the property of the municipality. The city has adopted the commission plan of government. Pop. 5,494.

SAINT BARTHOLOMEW, bār-thōl'ō-mū, or **SAINT BARTHELEMY**, sǎn bār-mā-mē, West Indies, an island 190 miles east of Porto Rico. It is about eight square miles in area, of irregular form and mountainous. Although nearly treeless it is fertile; vegetables are cultivated in some of the valleys and bananas, cassia, tamarinds, and sassafras are exported. Rocks and shallows make access to the island difficult for any but the larger coasting craft. Lead and zinc ores have been found in the island but are not worked. The principal town is Gustavia, near the port. The island belonged to Sweden, but in 1877 was sold to the French who had previously held it from 1648 to 1784; the people, who had retained the French language and customs, desiring it. Slavery was abolished in 1848. Pop. 2,942.

SAINT BARTHOLOMEW, Massacre of. See BARTHOLOMEW, SAINT, MASSACRE OF.

SAINT BEDE COLLEGE, a Roman Catholic institution, in Peru, Ill., opened in 1891, and in charge of the Order of Saint Benedict. The faculty numbers 18 professors, and the average annual attendance of students about 200. The courses are preparatory, commercial and classical. The classical course is intended for those studying for the priesthood or for the professions.

SAINT BENEDICT'S COLLEGE, Atchison, Kan., was founded in 1858 by Benedictine Fathers. Two courses of studies are offered, the classical and the commercial; the classical course leads to the degree of bachelor

of arts, while the degree of master of arts is conferred for two years' post-graduate study. The commercial course leads to the degrees of bachelor and master of accounts. A preparatory course is also provided. Two competitive scholarships are offered those who enter the classical course and there are five elective scholarships. Handsome new buildings with modern equipment grace the extensive college grounds since 1908. The average annual attendance of students is 250; the faculty numbers 26.

SAINT BERNARD, Great (Rom. *Alphis Pœnina*), Alpine Mountain pass, 8,108 feet above sea-level, 15 miles east of Mont Blanc, leading from Martigny, Switzerland, to Aosta, Italy, a distance of 53 miles, and connecting the valleys of the Rhone and the Dora Baltea. It was known to the Romans and traversed by them as early as 57 B.C., while a military road is recorded in 79 A.D. It was used also in mediæval times; and Napoleon used the pass with his army in May 1800. A carriage road now extends its full length.

The famous monastery or hospice of Saint Bernard, which stands at the summit of the pass, was founded in 962 by Saint Bernard of Menthon and is maintained for the relief of travelers lost in the snows or exhausted by the rigors of the journey. It is in charge of Augustinian monks, who, with their celebrated dogs, have saved countless lives, and who care for the bodies of the dead. There are remains of a temple of Jupiter Pœnius on the plain at the top of the pass, dating from the early days of the Roman Empire, and excavated in 1890-93.

SAINT BERNARD, Little (Rom. *Alphis Graia*), Alpine Mountain pass, 7,235 feet above sea-level, leading from Italy to France and connecting the valleys of the Isère and the Dora Baltea. It is believed to be the pass used by Hannibal and his army, 218 B.C. A monastery similar to that at Great Saint Bernard was founded here by Saint Bernard about 1000. A carriage road now traverses the pass. There are remains of a Roman road and temple.

SAINT BERNARD, Ohio, city in Hamilton County, a suburb of Cincinnati, on the Baltimore, the Ohio Southwestern, the Cleveland, Cincinnati, Chicago and Saint Louis and the Norfolk and Western railroads, and the Miami and Erie Canal. There are large manufacturing of soap, fertilizers and cigars. Pop. 5,002.

SAINT BERNARD OF CLAIRVAUX. See BERNARD, SAINT.

SAINT BERNARD DOG, a race of large dogs which gets its name from the Hospice of Saint Bernard, where it has long been kept by the monks to aid them in rescuing perishing travelers. This dog is very valuable in assisting the monks to keep to the line of the road and in finding their way back. They are seldom burdened. Dogs of other races are used for the same purpose in other parts of the Alps. The Saint Bernard dog is of two varieties: the rough and the smooth coated; the first, which has long white hair with black or tawny spots are few in number. This famous dog, according to the traditions of the monastery, is the result of a cross between a Danish bull-bitch

and a mastiff, a native hill dog, though at what time effected it is impossible to say. After the breed was once established it was kept pure till 1812. About 1860 these dogs first attracted attention of English travelers, who imported them to Great Britain, where they were exhibited and at once excited much notice on account of their size and beauty. Others were introduced, and the Saint Bernard was soon established as the most popular big dog, a popularity which has gone on increasing. The Saint Bernard, as bred to modern English ideas, is an immense red or orange colored dog, marked with white on muzzle, neck, chest, feet, and tip of tail. The head should be massive and imposing, with a strong square muzzle, a point of great importance. Legs should be straight, with large feet, and double or, at least, single dew claws. Hind feet should turn out, though not sufficiently to hinder the dog's movements. The coat of the rough variety is of medium length; it should not be too curly. In the smooth variety the coat should be short and wiry. Many of the finest Saint Bernards measure over 30 inches high at the shoulder and weigh over 150 pounds. While most of these dogs are good-tempered, strangers should be cautious in dealing with them; they are very likely to attack and kill small pet dogs, especially fox-terriers.

SAINT BONIFACE, Canada, city and county-seat of Provencher County, Manitoba, at the confluence of the Red River of the North with the Assiniboine, opposite Winnipeg, and on the Canadian Pacific, the Great Northern, the Canadian Northern and Grand Trunk Pacific railroads. It is the seat of the Roman Catholic archbishop of Manitoba, and has a college, seminary, normal school, convent and two hospitals. It has meat packing and lumber industries, as well as grain elevators, brickyards, glass works, and other manufactures. Pop. 7,483.

SAINT BRANDAN'S ISLE, a legendary island supposed to have existed to the southwest of the Canary Islands and to have been discovered by the Irish monk, Saint Brandan, and 75 brother monks in the 6th century, after seven years spent in search for the land of saints. This legend is traceable as far back as the 11th century. Each of the various early geographers gives it a different location. The legend had some influence upon the discovery of America.

SAINT-BRIEUC, sǎn-brē'ē', France, city, capital of the department Côtes-du-Nord, 63 miles by rail northwest of Rennes. It is built on a hill rising 290 feet above the right bank of the river Gorret, a mile from its outlet, in its port of Le Légué, on the bay of Mont Saint Michel. A considerable coasting trade is carried on in fish, garden and farm products, and the manufacturing industries include iron, steel and agricultural implement works, lumber, brush and wool factories. The city dates from a monastery established by the Welsh missionary Saint Bricuc, in the 5th century, and has had a turbulent history, especially during the 18th century Reign of Terror. The 13th century restored cathedral, a church of the same period, the modern church of Saint Michael, the bishop's palace, the city hall with its museum and picture gallery, the military bar-

racks, formerly an Ursuline convent, a statue of Du Guesclin, and the colossal statue of the Virgin on a dominating northern hill are among the chief features. Pop. urban, 15,300; communal, 23,000.

SAINT CATHARINES, Canada, town of Lincoln County, Ontario, on the Welland Canal, and on the Grand Trunk and Niagara, Saint Catharines and Toronto railways, 12 miles northwest of Niagara Falls, 32 miles east of Hamilton. Saint Catharines is noted for its mineral wells, has large hotels and is in a picturesque and fertile region. It has important manufacturing of agricultural implements, sewing machines, foundry products, saws, edge tools, furniture, flour, saw, also planing, mills, shipyards, tanneries, woolen factories and breweries. Saint Catharines also carries on an extensive fruit trade. It has good water and sewerage systems, gas and electric lights, banks and newspapers. The more noted local institutions are Bishop Ridley College, a marine hospital and a commercial college. Pop. about 15,000.

SAINT CHAMOND, sǎn shā-môn, France, in the department of Loire, eight miles northeast of Saint Etienne by rail, at the confluence of the Gier and Janon, is a well-built manufacturing city. There are large coal mines in the vicinity, famous dye-works and extensive metallurgical manufactures and various other industrial works, including large mills for the manufacture of silk, lace, etc. The remains of a Roman aqueduct are found at Saint Chamond. Pop. about 17,000.

SAINT CHARLES, Ill., city and county-seat of Kane County, 30 miles west of Chicago, on Fox River, and on the Chicago and Great Western and the Chicago and Northwestern railroads. It is built on both sides of the river, and has abundant water-power. It has milk condenseries, and manufactures steel ranges, chandeliers and pianos. Pop. 4,046.

SAINT CHARLES, Mo., city, county-seat of Saint Charles County, on the Missouri River, 20 miles from its mouth, and on the Wabash, the Missouri, Kansas and Texas railroads, about 14 miles northwest of Saint Louis. It was settled in 1769 by Blanchette "Chasseus," incorporated in 1795, and chartered as a city in 1849. There is an electric road connecting Saint Charles with Saint Louis. The city is in an agricultural region, in which the chief products are wheat and corn. The principal manufacturing establishments are car works and flour mills, shoe factory, oil engine works, and a stay factory. The city has large grain elevators, a foundry and machine shop. The principal public buildings are a court-house, 10 churches, 11 schools, post-office, city hall, and county jail. The educational institutions are Sacred Heart Academy, opened in 1818; Lindenwood College, the largest college for girls in the west, opened in 1830; a new high school, public and parish elementary schools, private schools and four libraries. Saint Charles has Blanchette Park which is nature's wonderful place of recreation and an excellent playground for children. The five banks have a combined capital of \$320,000. The government is vested in a mayor and a council of eight members, elected biennially. Pop. about 11,000.

SAINT CHARLES, Engagement at, a battle of the Civil War, fought in Arkansas County on the White River, 17 June 1862. On 10 June Capt. C. H. Davis, then in command of the Federal Mississippi flotilla, received a request from General Halleck to open up the White River for communication; he accordingly despatched a force under Commander Kilty, consisting of the ironclads *Mound City* and *Saint Louis*, and the wooden gunboats *Lexington* and *Conestoga*. Meanwhile the Confederates had fortified the bluffs at Saint Charles and, on learning of the approach of the Union vessels, had sunk their gunboat *Maurepas* across the channel and transferred her guns to the shore-battery. On 17 June a detachment of Federal troops landed below the bluffs, and the gunboats opened the attack upon the Confederate position, the *Mound City* leading; when she was within 600 yards of the shore a 42-pound shell entered her casemate and exploded her steam-drum; badly crippled she was towed out of action by the *Conestoga*, and the other boats continued the attack. The commanding officer of the land forces very shortly signaled them to stop firing, and the troops successfully stormed the Confederate battery. The Confederate loss was six killed, one wounded and eight missing; the most serious Federal loss was on the *Mound City*, the majority of her crew being killed by the escaping steam, or in consequence of jumping into the river. Of 175, only three officers and 22 men were saved. As there were no Confederate works farther up the river, this action gave control of the White River to the Federals. Consult Mahan, 'The Gulf and Inland Waters,' p. 50; 'Battles and Leaders of the Civil War' (Vol. III, pp. 552-553).

SAINT CHARLES COLLEGE, Catonsville, Md., under the auspices of the Roman Catholic Church, was founded 11 July 1831 at Ellicott City, Md. The funds for the institution were donated by Charles Carroll of Carrollton, one of the signers of the Declaration of Independence, who gave 253 acres of land from his own domain, and \$5,349 in money. The charter of the school as agreed upon by Archbishop Maréchal of Baltimore and Charles Carroll, stipulated that the purpose of the school was "the education of pious young men of the Catholic persuasion for the ministry of the gospel," and that the legal administration of the college should be entrusted to five trustees, who must be citizens of the United States. The founder also requested that the trustees be members of the Society of Saint Sulpice. The school was not opened until October 1848. The faculty then consisted of the president, one assistant and four students. Under the direction of the Rev. Oliver Lawrence Jenkins during 18 years the college steadily developed, until at his death in 1869 the faculty numbered 13, the students 140 and 100 graduates were at work in the ministry. On 16 March 1911 the college was totally destroyed by fire. Plans for rebuilding were promptly set in action on a more eligible site at Catonsville generously deeded by Saint Mary's Seminary of Baltimore. Fine buildings and spacious grounds furnish all facilities. Saint Charles College forms the classical department of Saint Mary's University and Theological Seminary of Saint Sulpice,

at Baltimore. The course including the preparatory work is six years. The college has power to grant degrees. Several scholarships are available in competitive examination. Recent statistics give the faculty numbers as 18, the students as 190. Of 4,461 students who have matriculated, over 1,500 have been ordained. Among its distinguished sons Saint Charles counts a cardinal, five archbishops and 13 bishops.

SAINT CHRISTOPHER, popularly **SAINT KITTS,** West Indies, 45 miles northwest of Guadeloupe, is an island belonging to the Leeward group, and a British possession. Its area is 68 square miles; its length 23 miles; breadth five miles. It is traversed by a rugged range whose highest summit, Mount Misery, has an altitude of about 4,000 feet. Basse-Terre, the capital, on the coast, has a population of about 7,000. It is united administratively with Nevis, and the small island Anguila. The chief products are sugar, molasses, rum, salt, some coffee, tobacco and cattle. The island was discovered in 1493 by Columbus; colonized by the French and British simultaneously in 1625, and held by those nations alternately for some time, passing over entirely to England in 1713.

ST. CLAIR, Arthur, American soldier: b. Thurso, Caithness, Scotland, 1734; d. Greensburg, Pa., 31 Aug. 1818. He was a grandson of the Earl of Roslyn and was educated at the University of Edinburgh, after which he studied medicine. He came to America with the fleet of Admiral Boscawin and took part in the capture of Louisburg and of Quebec. In 1762 he resigned his commission of lieutenant and two years later established a home and a manufacturing industry in Ligonier Valley, Pa. He became prominent in his vicinity and held several civil offices. In 1775 he was made colonel of militia; and on 9 Aug. 1776 was appointed brigadier-general and was ordered by Washington to organize the New Jersey militia. He fought at Trenton and Princeton, and having been appointed major-general in 1777, succeeded General Gates in command at Ticonderoga. At the approach of Burgoyne, with a force more than three times outnumbering his, he evacuated the fort. A part of his force was attacked and defeated at Hubbardton. For this disaster he was tried in court-martial in 1778, but acquitted of the charges brought against him. He commanded a body of troops in 1781-82 under General Greene in the South; was a delegate to the Continental Congress in 1785-87 and its president in 1787. He was appointed first governor of the Northwest Territory in 1789, and was appointed commander-in-chief of the forces engaged in warfare with the Indians in 1791, but was defeated on 4 November, near the Miami villages. In March of the following year he resigned his commission and in 1802 President Jefferson relieved him of the governorship of the Territory. He published 'A Narrative of the Manner in which the Campaign against the Indians in the year 1791 was conducted under the command of Maj.-Gen. St. Clair,' with his observations on the statements of the Secretary of War (1812). Consult Smith, W. H., 'The Life and Public Services of Arthur St. Clair' (1882).

SAINT CLAIR, Mich., city in Saint Clair County, situated at the mouth of the Saint Clair River, and on the Michigan Central Railroad, about 43 miles northeast of Detroit and 12 miles south of Port Huron. A ferry connects the city with Courtwright on the Canadian side of the river. It is in an agricultural region and has considerable manufacturing interests. The chief industrial establishments are lumber mills, sash, door and blind factories, shipyards, salt works, brick works, iron works, foundry and tannery. The value of its taxable property is \$1,708,475. There are good public, Catholic, Lutheran schools, and churches of the various denominations. The government is vested in a mayor and council. There is a good system of waterworks. Pop. 3,000.

SAINT CLAIR, Pa., borough in Schuylkill County, on the Philadelphia and Reading, and the Pennsylvania railroads, five miles north of Pottsville. An electric railroad connects the borough with Pottsville. It is in an anthracite region, and the chief industries are connected with mining and shipping coal. It has large coal shipping yards, a large mining implement works, two shirt factories, and a miners' squib factory. There are a high school, public and parish schools, a private school, and a library. Pop. 7,000.

SAINT CLAIR, a lake on the boundary between Michigan and Canada, and between Lake Huron and Lake Erie. It receives the waters of Lake Huron through Saint Clair River and discharges its waters into Lake Erie through Detroit River. It is about 30 miles long, from north to south; its maximum width is 24 miles and the average width 12 miles; area, 396 square miles. It is about three feet higher than Lake Erie and five feet four inches lower than Lake Huron. The northern part is shallow, owing to the sediment from Saint Clair River; the average depth of the central part is 19 feet. The bed is covered with a blue mud, with sand and gravel in some parts, all supporting a dense growth of low vegetation in which are many forms of animal life. The lake is noted for the large number of steamers and the enormous tonnage which it carries each year.

SAINT CLAIR, a river called originally Sinclair, in honor of Patrick Sinclair, a British officer, who in 1765 purchased from the Indians a tract of land along the river. The river is the outlet of Lake Huron, and discharges its waters by several channels into Lake Saint Clair. The delta at the mouth is known as the Saint Clair Flats. A number of summer cottages and hotels have been built on the Flats. One of the channels has been improved for navigation; a canal about one and one-half miles long has been built at such an angle as to shorten the course, and of such a width and depth as to admit large lake steamers. A railroad tunnel under the river connects Port Huron in the United States with Sarnia in Canada. It is nearly two miles long, including approaches, and was opened for travel in 1891. The river is about 41 miles long.

SAINT CLOUD, sãn-kloo, France, in the department of Seine-et-Oise, on a height near the Seine, seven miles west of Paris, is charmingly situated and especially interesting for its historical associations. It commands a superb

view of Paris, and the beautiful shady park, with its chateau and elegant fountains, is a favorite resort of Parisians. Within the precincts of Saint Cloud are situated the new national Sèvres porcelain manufactory. The chateau was built by Gondi in 1572, purchased by the Duke of Orléans, the brother of Louis XIV in 1658, and by Louis XVI for Marie Antoinette in 1782. Henry III was murdered in the old mansion by Jacques Clement 21 Aug. 1589. Peter the Great was received there in 1717. It was the scene of Napoleon's coup of the 18th Brumaire, and his favorite residence; here he caused himself to be declared first consul, and here Blücher had his headquarters (1815). At Saint Cloud, Charles X (1830) affixed his signature to the ordinances which doomed him. Here Napoleon III signed the declaration of war against Prussia (1870).

SAINT CLOUD, Minn., city, county-seat of Stearns County, situated on the Mississippi River about 65 miles north of Minneapolis, on the Northern Pacific and Great Northern railroads. It was settled by John L. Wilson, it being located on his homestead platted by him in 1855, was incorporated in 1856, and adopted its first city charter in 1868. Saint Cloud and surrounding region lies above extensive and very valuable quarry ledges of red and gray granite that are used for monumental purposes, some building and road work. The business of shipping the finished product, monuments, etc., has increased to such an extent that the output for one year alone was \$2,000,000. The city possesses one of the finest waterpowers on the Mississippi River. The developed and undeveloped waterpower amounts to 22,500 horsepower. The Public Service Company has a hydro-electric plant and owns 300 miles of high-voltage lines that supply light to 40 villages and cities, in addition to the electric power supplied to the city of Saint Cloud, State reformatory and innumerable quarries in surrounding districts. They also own a gas plant. The chief manufacturing establishments are manufactures of automobiles, trucks and tractors, also drop-forgings. The Great Northern shops are located in the city. Other manufacturing factories are flour mills, iron works, foundries, machine shops, woolen mills, sledge factory, broom factory, woodworking factories and blank book and tablet factories; cold storage and creameries, agricultural implements, etc.

The Watab Paper and Pulp Mills, one of the largest in the Northwest, is located five miles north of the city. The large surrounding region has fine, large, fertile and productive farms; both grain and stock farms, of prize horses and cattle. Saint Cloud has the Minnesota State reformatory prison, Saint Raphael Hospital and Saint Joseph's Home for the Aged. The educational institutions are the State Normal School, largest in the State, public schools, technical high school—cost about \$280,000, junior high school, three Catholic parochial schools with their high school, and a Carnegie public library. The Saint Cloud Institute—one of the finest buildings for a community centre is located here. Saint Cloud is the seat of a Roman Catholic bishop. There are 20 churches.

On 22 April 1912 the city of Saint Cloud adopted the commission form of government. Pop. 15,487.

SAINT CROIX (sometimes called **SCHOODIC**), (1) a river, the outlet of Grand Lake, flows south, east-southeast, and forms part of the boundary between Maine and New Brunswick. It empties into Passamaquoddy Bay. It is 75 miles long; navigable as far as Calais, Me., above which there is extensive water power. (2) A river which rises in Douglas County, Wis., flows southwest to the Minnesota border, then south, forming the boundary between Wisconsin and Minnesota for a distance of about 100 miles, entering Mississippi River at Prescott, Wis. It is about 150 miles long and navigable to the Falls or the Dalles, a distance of 54 miles from its mouth. At the Falls there is a descent of 50 feet in 900 feet, and below there is a cañon.

SAINT-CYR, **Laurent Gouvion**, lō-rōñ goo-vē-ōñ sǎñ sēr, **MARQUIS DE**, marshal of France: b. Toul, France, 13 April 1764; d. Hyères, France, 17 March 1830. In 1792 he entered the army and was attached to the staff of General Custine. He was rapidly promoted and in 1796 commanded the centre division in the army on the Rhine under Moreau. He was appointed to the command of the army of Italy in 1798 where he re-established discipline, the army having been on the verge of revolt against their general, Masséna. He returned to the army of Moreau in 1799, was victorious at Biberach in 1800, and in 1801 was sent to Spain to command the army which was to invade Portugal. After the treaty of peace was signed he became Ambassador to Madrid. He participated in the Prussian and Polish campaigns of 1807, and in 1808 was in command in Catalonia, where he relieved Barcelona. In 1811 he was assigned to the command of a corps in the Russian campaign. He was victorious at Polotsk in 1812 and was created marshal of France in recognition of his services. He made a brilliant fight at Dresden, but was forced to capitulate and remained a prisoner in Hungary for some time. After the Restoration he was created a peer of France, was appointed Minister of War in 1815, Minister of Marine in 1817 and a few months later Minister of War again, retiring in 1819. He wrote 'Journal des opérations de l'armée de Catalogue en 1808 et 1809' (1821); 'Mémoires' (1829-31), etc. Consult De Vernon, 'Vie de Maréchal Gouvion Saint-Cyr' (1857).

SAINT CYR, or **SAINT CYR-L'ECOLE**, lā-kol, France, a village near Paris, west of Versailles, at the end of the old park of Louis XIV, celebrated for its military school. Madame de Maintenon founded here (1686) a seminary for the education of the daughters of families of high rank in reduced circumstances. The convent chapel contained the tomb of Madame de Maintenon, and Racine's 'Esther' and 'Athalie' were written for the pupils of the school and first acted there. During the Revolution this institution was abolished, and in 1806 Napoleon transferred to Saint Cyr the famous military academy which he had founded at Fontainebleau. Two advanced forts of the new enceinte around Paris are situated at Saint Cyr. Pop. about 5,000.

SAINT DENIS, sǎñ dē-nē, France, in the department of Seine, four and one-half miles north of Paris, is an important junction on the Northern Railroad. The town is especially

celebrated for its venerable abbey, from which it derives its name; the two high towers are respectively Romanesque and Gothic; the rose window dates from the 13th century. The abbey was the burial place of the kings of France and in the chapels of the nave are the tombs of Louis XII, and Anne of Brittany (1591); of Henry II; Catharine de'Medici; Louis of Orleans; Francis I; and Claude of France—one of the splendid tombs of the Renaissance; and that of Dagobert, one of the most curious of mediæval (13th century) works of art. The Crypt dates partly from the time of Charlemagne. In the centre is the vault, where the last king reposes—Louis XVIII, the only one whose ashes have been respected. The crypt also contains the Bourbon vault, where repose Louis XVI and Marie Antoinette. Modern features deserving notice are an orphanage (1886), the monument commemorative of the Revolution and other public statues, and the railway station. In 1888 the old Hotel Dieu was converted into a hospital for old men. Pop. about 72,000.

SAINT-DENIS, the capital of the French island of Réunion in the Indian Ocean, on the north coast of the island. It is built on a long, narrow beach shut off on the land side by a range of high volcanic mountains. In the city are a cathedral, a palace for the governor, a theatre, and a large number of educational institutions, including a lyceum, several large schools, a library, a museum, and a botanical garden. The harbor is an open roadstead exposed to frequent severe storms, but a new, protected harbor has been constructed at Pointe des Gallets, a few miles to the west, which is connected with the city by a railroad. Pop. about 25,000, chiefly French creoles.

SAINT DIZIER, sǎñ dē-zē-ā (ancient **DESIDERII FANUM**), France, department of Haute-Marne, on the Marne, 35 miles southeast of Châlons. Part of the old castle is standing and the church has some peculiar Gothic windows. There is a library and a museum. It is an important centre of the iron trade, with foundries of iron, steel, copper and bronze, engineering works, etc. It is a railway station. In 1544 Saint Dizier was besieged and taken by Charles V, although strongly fortified. In 1814 there was severe fighting nearby, between Napoleon and the Allies. The walls have been razed and the site now constitutes the promenade of the town. Pop. about 15,000.

SAINT ELIAS, Mount, in Alaska, in the southeastern part of the Territory; long. 140° 55' 47.3" W.; lat. 60° 17' 35.1" N. The United States Coast and Geodetic Survey report the height 18,100 feet above sea-level. It rises from an elevation of considerable height, and the foot-hills on the south side are covered with trees. The timber line is from 2,000 to 2,500 feet above sea-level. The mountain itself is covered with snow and ice and has many glaciers. The south side is almost perpendicular; the storms of ages and the avalanches have removed many of its rugged features. The north side is more accessible, and has been explored to some extent. The Malaspina glacier (area with subsidiary glaciers 1,500 square miles) is on the slope and at the foot of Mount Saint Elias, near Yakutat Bay.

SAINT ELMO CASTLE, Naples, Italy, a fortress crowning a rocky hill on the western outskirts of the city. It was built by Robert the Wise in 1343. It has massive walls surrounded by fosses cut out of the solid rock, and was long held to be impregnable. It is now used as a military prison.

SAINT ELMO'S FIRE. See **ELMO'S FIRE**, **SAINT**.

SAINT ETIENNE, sǎn tǎ-tē-ën, France, a manufacturing town in the department of the Loire, on the Furens, 32 miles southwest of Lyons. It is located amid some of the richest coal fields of France. The important buildings include the old abbey of Valbenoite, dating partly from the 13th century, a Protestant church, a synagogue, a town house, a school of mines with fine collections, and an art palace, with a museum and library, rich in old manuscripts, collections of natural history, and of ancient artillery. The enormous metallurgical establishments yield one-third of the whole French production of steel, manufactured according to the Bessemer and Martin processes. Here are also the national gun factory and other metal works. The manufacture of hemp cables, pottery and lime, the weaving of ribbon, laces, trimmings, etc., and conditioning of silk are among the varied and active industries of the town, giving employment to thousands of men and women. The collieries are very extensive, alone employing 15,000 miners, while 80,000 work in the ribbon factories, 16,000 operatives on heavy iron goods, 7,000 on hardware, and 6,000 on military and naval material, etc.

SAINT EUSTATIUS, or **STATIA**, an island in the Dutch West Indies, one of the Lesser Antilles. In 1774, the closing of the port of Boston, by order of the British government, shut off the supplies of food hitherto furnished by the colonists, caused the death of 15,000 negro slaves in the West Indies. From immediately after the battles of Lexington and Bunker Hill, this island became the chief source of supplies for the Continental Congress and armies. Fleets of American privateers, loaded with dried fish, rice, sugar, tobacco and indigo, traded their cargoes for war munitions. Here, on 17 Nov. 1776, the Dutch governor, Johannes de Graeff, after having read the Declaration of Independence, shown him by Captain Josiah Robinson, of the United States man-of-war, *Andrea Doria*, 29 guns, ordered a salute to be fired in honor of "the Congress flag" and the new nation. This was the first formal foreign salute in honor of the 13-striped American flag, on which were represented as many independent States in Union. From May 1775 until 1781, Saint Eustatius, or "Old Statia," as our fathers called it, was a mart for many nations. On 3 Feb. 1781, Admiral George Rodney, with the largest fleet ever assembled under the British flag—leaving Cornwallis in the lurch—captured the island and 24 American ships, including two men-of-war, with 2,000 sailors. Rodney auctioned off \$11,000,000 worth of stores, but was plagued for years with lawsuits, since many of the traders were from Great Britain. Much of the confiscated property was British, and some of his heavily loaded prize ships on their way to England were captured by French privateers. Consult De Graeff's 'Deductie' (The Hague,

p. 344, 1779); Griffis, *New England Magazine*, July 1893; Ferger, 'Alone in the Caribbean' (1918).

SAINT-EVREMOND, sǎn-tāv-r-môn, Charles de Marguetel de Saint Denis, French courtier and author: b. Saint Denis-le-Guast, 1 April 1613; d. England, 20 Sept. 1703. He was educated by the Jesuits, entered the army about 1629, served in Italy under Bassompierre and later in Germany in the Thirty Years' War. He was a witty and accomplished courtier, and was for a time a favorite with Condé and also with the king; but incurred their displeasure by his sarcastic raillery and especially by his letter on the Peace of the Pyrenees. In 1662 he went to England, where he became a favorite at court and received a pension of £300 (\$1,500) from Charles II. He wrote dramas, essays and letters, his collected works being published in 1705. These include 'Sir Politics,' written with Buckingham. Consult Merlet, Gustave, 'Saint Evremond, etude historique' (Paris 1870).

SAINT FRANCIS, a river which rises in eastern Missouri and flows into the Mississippi River in Arkansas, lat. 34° 45' N. It is a large river, and was formerly navigable 300 miles for large keel boats; but the earthquakes of 1811-12 raised its channel so much, and so irregularly, as to cause the waters to overflow the banks and form a vast number of lakes and swamps. At high water the river is still navigable at some seasons of the year for about 150 miles. Its waters abound with excellent fish. Length, about 450 miles.

SAINT FRANCIS OF ASSISI. See **CANTICLE OF THE SUN**; **FRANCIS OF ASSISI**.

SAINT FRANCIS XAVIER COLLEGE, New York City. It was founded in 1847 by the Jesuits, and was granted the powers of a university in 1861 by the State board of regents. Its organization includes a collegiate and a preparatory department. The regular college course leads to the degree of A.B.; it includes instruction in logic, metaphysics, and theodicy, English and the classics, mathematics and science, and history. Post-graduate work in literature, history, sociology and psychology is provided for, and leads to the degree of A.M. There are 46 scholarships. The college is well equipped; the library contains 115,000 volumes, and the grounds and buildings were valued at over \$750,000. Student attendance averages 450, a large majority being in the preparatory department; the faculty numbers 38. In 1913, the college department was removed from the island of Manhattan to Brooklyn, N. Y., where it still continues to confer degrees as the College of Saint Francis Xavier, N. Y. The high school department remains at its former location.

SAINT GALL, gāl, Switzerland, (1) capital of the canton of Saint Gall, on the Steinach, in a high, narrow valley, about 50 miles from Zürich. It is the see of a bishop, and has besides the cathedral, several churches, a monastery, now containing public offices, a large town-house, library and orphan asylum. The town library is rich in works relating to the Reformation. The ancient Benedictine Abbey was famous as an asylum of learning during the Dark Ages, and was one of the most celebrated educational institutions of Europe. Several of

THE PURITAN

By Saint-Gaudens

the classics, namely, Quintilian, Silicus, Italicus, and Ammianus Marcellinus, were preserved solely among its manuscripts. Notker and Ekkehard were among its pupils. Saint Gall is an important manufacturing centre, celebrated for its fine laces and embroideries. Pop. 38,683. (2) The canton covers an area of about 780 square miles. It has a diversified surface; the southern and central portions are covered by lofty Alpine ranges. Its principal lake is the Walensee but it also contains part of the Lake of Constance. The climate of the valley is mild, but in the mountainous district is rigorous. There are important stone quarries, much wood and good pastures; on the lower slopes vineyards and orchards, and some arable lands. Manufactures consist of cotton and linen goods. The constitution is pre-eminently democratic. German is the main language spoken. Pop. about 301,141.

SAINT-GAUDENS, gā'dēnz, Augustus, American sculptor: b. Dublin, Ireland, 1 March 1848; d. Cornish, N. H., 3 Aug. 1907. He was brought to the United States in infancy and at 13 was bound in apprenticeship to learn cameo-cutting and spent several years at this art. Six years later (1867) he went to Paris and studied under the sculptor Joffroy at the Ecole des Beaux Arts. While at Rome in 1871 he produced his first figure, 'Hiawatha,' and the following year returned to the United States. Saint-Gaudens was a sculptor of originality and freshness, who had adopted the best standards of French taste and method of execution without being hidebound by tradition. He had a style at once polished and free. Among his other works are the 'President Lincoln' statue in Lincoln Park, Chicago; the bas-relief 'Adoration of the Cross by Angels'; the 'Shaw Monument' at Boston; and the 'Diana' on the tower of Madison Square Garden, New York. He also took part in executing the 'Parnell Memorial' monument in 1901, designed several medals of presentation authorized by Congress, and assisted John La Farge in decorating Trinity Church, Boston.

What perhaps is the most strikingly characteristic of all his ideal statues is 'The Puritan' (at Springfield, Mass.). It represents the puritan of earlier New England in all his aggressive and unbending strength — soldier, theologian, statesman. There is nothing winning or conciliating in his air. He is come to conquer the wilderness as Cromwell conquered the aristocracy of England and wiped out for the brief period of the commonwealth the haughtiest of European dynasties. The puritan, as Saint-Gaudens has portrayed him, carries the Bible next his heart in one hand and a stout cudgel of oak in the other. He personifies those unswerving, and sometimes fanatic principles on which the ancient commonwealths of New England were established. The Sherman equestrian statue which was unveiled at the southeast entrance of Central Park in 1904 is the last of a series of five in which he commemorated heroes of the Civil War, among the most notable of which is the remarkable statue of Farragut in Madison Square, New York. Of the Sherman monument, executed by Saint-Gaudens, a critic had said: "The composition of the Sherman is his own, and it has the spontaneity and the balance of a work evolved straight from a

powerful imagination and an original mind. The Victory is exactly where it belongs, and bears a relation as true, as unforced, as anything in nature itself to the horseman pressing close upon its flying robe. Once more a word on the sculptor's discretion is inevitable. He wanted to express movement in this monument, to give to Victory almost aerial lightness in her carriage, to embody in the horse a type of great strength, pushing its way to the front, and to make Sherman himself the very ideal of a leader, who spurns the miles behind him. The bronze seems almost sentient. The group quivers with vitality. But the rhythm of this dramatic conception is held so well in hand, it is so majestic, that classic art itself could not produce a more nobly monumental effect."

SAINT GEORGE, Cape, Newfoundland, the westernmost projection of the island, forming the northwestern extremity of Saint George Bay, on the Gulf of Saint Lawrence.

SAINT GEORGE AND THE DRAGON. See DRAGON.

SAINT GEORGE'S CHANNEL, an arm of the Atlantic which separates Ireland from England. At the north it unites with the Irish Sea. Its entire length from southwest to northeast is about 100 miles. The tide rises in this channel about the same time as in the English Channel, so that there is high water simultaneously at Brest in France, Falmouth in England, and Cape Clear in Ireland.

SAINT GEORGE'S CHAPEL, Windsor, England. See WINDSOR.

SAINT-GERMAIN, sǎn-zhēr-mǎn, COUNT OF, adventurer of the 18th century: b. perhaps 1710; d. Eckernförde, Schleswig, 1784. A mystery enveloped his birth and origin, of which he took every advantage. He spoke English, German, Italian, Spanish and Portuguese to perfection, and French with a slight Piedmontese accent; and was variously thought to be the son of a tax collector at San Germano, Savoy, an Alsatian Jew, a Portuguese marquis named Betmar, or the illicit offspring of a Spanish princess. After sojourning in various cities of Italy under as many pseudonyms, he lived from 1750 to 1760 at the French court under the patronage of Marshal de Belle-Isle, and, having a fine personal appearance and address, considerable erudition and a wonderful memory, became a favorite of Mme. de Pompadour and the king. He was reported to be from 2,000 to 3,000 years old. Frederick the Great, having asked Voltaire for some particulars respecting this mysterious person, was told that he was "a man who never dies and who knows every thing." He passed the last years of his life at the court of the prince of Hesse-Cassel, and is supposed to have been employed during the greater part of his life as a spy at the courts at which he resided. Cagliostro owned himself a pupil of the Count of Saint Germain. Consult Oettinger, 'Graf Saint Germain' (1846).

SAINT GERMAIN-EN-LAYE, sǎn lǎ, France, a town in the department of Seine-et-Oise, on a height bordering the Seine, 11 miles west of Paris. At the edge of a forest, 200 feet above the river, the air is bracing and salubrious. It is a favorite summer resort and

residence of Parisians. The terrace of Saint Germain is one of the finest promenades in Europe and commands an extensive view of the valley of the Seine and surrounding hills. The ancient castle of the town now serves as a museum of antiquities; it was destroyed and restored at various epochs. This castle was first built by Charles V (1370), on the site of a still older structure, and reconstructed and embellished by many succeeding sovereigns, especially Louis XIV. Here were born Charles IX, Margaret of Navarre, Henry II and Louis XIV. James II of England and most of his family here lived and died as exiles. In the Henry IV pavilion Thiers died (1877). Saint Germain is the seat of one of the cavalry garrisons which surround Paris; at a short distance is the Convent des Loges, connected with the Legion of Honor (Saint Denis).

SAINT GERMAIN DE RIMOUSKI. See RIMOUSKI.

SAINT GOTTHARD, göth'ard, Switzerland, a mountain group on the confines of the cantons Uri, Grisons, Ticino and Valais, belonging to the Lepontine or Helvetian Alps, which it connects with the Bernese Alps. It forms a kind of central nucleus in the great watershed of Europe; each of its slopes giving rise to an important river—the north to the Reuss, the south to the Ticino, the west to the Rhône, and the east to the Rhine. All these rivers rise within a circuit of 10 miles from its centre. The culminating point has a height of 10,600 feet, and three other summits are beyond the limit of perpetual snow. The Col of Saint Gotthard, at its summit level, where the Hospice stands, is 6,808 feet high. A bridle path through the pass had existed since the 6th century and over it an excellent carriage road was completed in 1832, in which, particularly on the Italian side, formidable difficulties were surmounted, and much engineering skill displayed. A railway tunnel pierces this mountain group between Göschenen on the north and Airolo on the south, thus directly connecting the railway system of North Italy with those of Switzerland and Western and Central Germany. This tunnel is the longest in the world, being 16,295 yards, or rather more than 9¼ miles long. Its construction, begun in 1872, was completed in 1881, and it was opened for traffic early in 1882. The total cost of the railway and tunnel was about \$57,800,000, of which \$11,500,000 was expended on the tunnel alone, the expenses being met by Swiss, German and Italian state subventions, by mortgages and shares. The excavation was carried on simultaneously from the Italian and the Swiss side, the workmen finally meeting in the middle, where the height above sea-level is 3,785 feet.

SAINT GREGORY. See GREGORY, SAINT.

SAINT HELENA, Cal., the second town in size and importance in Napa County, 18 miles north of Napa, the county-seat, and 64 miles north of San Francisco, on the Southern Pacific Railroad. Saint Helena is part of the Carne Humana rancho, a Mexican grant that comprised all the northern part of Napa County. All lands in the rancho became the property of Dr. E. T. Bale by Mexican grant. The first men to settle the grant where Saint Helena is located were David Hudson and John York,

who came thither from Missouri in 1848. The town of Saint Helena was started in 1853 by J. H. Still, an Englishman, who opened a general merchandise store on one of the numerous wood roads, the country all around being thickly wooded. Two years later Mr. Still donated building lots to others who would venture in business and a shoemaker's shop, blacksmith's shop and a few other enterprises were established. The town was named Saint Helena from the mountain of that name which stands at the head of Napa Valley. The honor of naming the town was claimed by Henry Still, William Taylor and J. W. Booker. The first school was built in 1858. The town now has fine stone buildings to house its grammar and high schools. The Ursuline Sisters conduct an academy for girls and the Seventh-Day Adventists conduct a church school, making the educational advantages unexcelled. Saint Helena also has a public library. The first church was built in 1857 and at present six denominations own their own places of worship. The town was incorporated 24 March 1876 and reincorporated 14 May 1889. The municipality has a complete sewer system. Water is furnished by a private corporation and electricity for lights and power is distributed by a company organized for that purpose. Saint Helena has several stone bridges and over eight miles of cement sidewalks. Its main street is paved. There are three banks the combined resources of which total \$2,000,000. There are two newspapers, the *Star* and the *Photogram*. The principal industries are viticulture and horticulture, poultry-raising and general farming. Business enterprises are well represented and there are several fraternal orders. Pop. 2,000.

SAINT HELENA, hě-lě'na, an island in the Atlantic, belonging to Great Britain, 700 miles southeast of the island of Ascension, the nearest land. The area is about 47 square miles. Although remote from the mainland, it is in the direct line of ocean communication via the Cape of Good Hope, many vessels making it a stopping point. It is of volcanic origin, the crater of the volcano forming the main ridge of the island. Many gorges, some of which are 1,000 feet deep, converge from the walls of the crater in all directions and numerous caves have been formed. High cliffs extend all along its shores to the water's edge, and there is a good harbor. The fauna and flora are interesting, many specimens being peculiar to the island. Farm and garden produce constitutes the entire wealth of the colony. Jamestown (3,000 inhabitants) is the only town. Longwood, where Napoleon died, is a farm-house, standing on a high plain. The Portuguese discovered the island, subsequently the Dutch took possession, and later it was ceded to Great Britain. Its chief interest is in its having been the place of Napoleon's captivity.

SAINT HELENS, England, Lancashire, 11 miles northeast of Liverpool, a municipal county and parliamentary borough, and market town. A total hall (1875-76), a technical institute (1896), churches, schools, library and baths, an asylum and hospitals, numerous parks and recreation grounds are the main features. The town owes its importance to the coal-beds in the environs, copper-smelting, the manufacture

of iron and steel, chemical and lead works, potteries, breweries, its glass works and other industries. Pop. about 97,000.

SAINT HELENS, a volcanic peak of the Cascade Range, in the State of Washington; lat. 46° 12' N., long. 122° 4' W., height, 9,750 feet. The volcanic débris at the base and beyond is of ancient origin; the mountain has all the appearance of an extinct volcano. It resembles Mount Rainier in its treeless sides and ice-covered summit, but it is smaller. On the north side, at the base, is Spirit Lake.

SAINT HELIER, hêl-yêr, Channel Islands, capital of the island of Jersey, and a favorite European summer resort, on the east side of Saint Aubin's Bay, on the south coast. It is strongly fortified and defended by Elizabeth Castle (1551-86), on a rocky island connected with the mainland by a causeway, and by Fort Regent, an imposing citadel dominating the town. The principal buildings are Victoria College, the Maison Saint Louis or Jesuit College, the court-house, public library, town hall, hospital, Norman parish church and the French Roman Catholic cathedral. Fine markets, an esplanade and marine drive four miles long encircling the bay, and extensive and well-built harbors, are prominent features. There is considerable trade with England, France and India, in fruit, potatoes and cattle. Pop. about 30,000.

SAINT HENRI, or **TANNERY WEST**, Canada, an incorporated city of Hochelaga County, Quebec, suburban to Montreal on the southwest. It is a busy industrial centre on the Lachine Canal, and has a station on the Grand Trunk Railway. Cotton, leather, confectionery, sewing machines and machinery are among its principal manufactures.

SAINT-HILAIRE, sãñ-tê-lâr, Augustin François César, called **Auguste Prouvençal de**, French naturalist and traveler: b. Orléans, 4 Oct. 1779; d. there, 30 Sept. 1853. A botanical expert, he set out in 1816 on a long journey through Brazil, carrying his explorations to regions then unknown, and returning in 1822 with valuable collections. In 1830 he was admitted to the Paris Academy of Sciences; subsequently he was made professor of botany in the Faculty of Sciences at Paris. He made several discoveries of scientific value, and published three narratives of travel, 'Voyage dans les provinces de Rio de Janeiro et Minas Gerães' (1830); 'Voyage dans le district des diamants et sur le littoral du Brésil' (1833); 'Voyage aux sources de San Francisco et dans la province de Goyaz' (1847-48); besides 'Flora Brasiliæ Meridionalis' (with Jussieu and Cambessès 1825), and 'Leçons de Botanique' (1840-41).

SAINT-HILAIRE, Marco de, pseudonym of EMILE MARC HILAIRE, French writer: b. Versailles, about 1796; d. 5 Dec. 1887. He was educated as a page at the court of Napoleon I, and finding himself without means of support after the Restoration, turned his attention to literature. Though not important as a writer, his constant glorification of Napoleon was popular and undoubtedly did much to pave the way for the Second Empire. His work includes 'Mémoires d'un page de la cour impériale' (1830); 'Souvenirs de la vie privée de Napoléon' (1838); 'Souvenirs intimes du temps

de l'Empire' (6 vols., 1838-46); 'Histoire de Napoleon III' (1853), etc.

SAINT HUBERT, Order of, a Bavarian order founded by Gerhardt V in 1444, and originally named the Order of the Horn, so called from the hunting horns of which the links of chain were made. The membership was composed of the nobility, the number being unrestricted, while those of lower rank were limited to 12. A white cross with eight points, on each of which is a small golden ball, constitutes the decoration of the order. A crown surmounts the cross, while the arms of the cross are divided by three rays of gold representing Light from Heaven. On the medallion is pictured Saint Hubert's conversion, under which, on a red ribbon, is the inscription 'In trav vast' (Firm in Faith).

SAINT HYACINTHE, hi'ã-sinth (Fr. Sãñt ê-ã-sãñt), Canada, city and port of entry, county-seat of Saint Hyacinthe County, Quebec, on the Yamaska and Black Rivers, and on the Grand Trunk, Canadian Pacific, Intercolonial and Quebec Southern railways; 35 miles northeast of Montreal. It is the seat of a Roman Catholic bishop, and among its more notable institutions are Saint Hyacinthe College (Jesuit), occupying a handsome stone building, a nunnery with a seminary for young ladies, a hospital in charge of the Sisters of Charity, and monasteries of the Precious Blood and Dominican Fathers. The principal manufactures of the city are woolen goods, lace, linens, hosiery, corsets, boots and shoes, leather, flour, lumber, woodenware, organs, agricultural implements, and casting and machinery. Pop. about 12,000.

SAINT IGNATIUS COLLEGE, a Roman Catholic institution located at Chicago, Ill. It was chartered in 1870, and is under the control of the Jesuits. It has a collegiate or classical, and an academic department; religious instruction is a part of all courses. In the collegiate department the degrees of A.B., B.S. and Ph.B. are conferred; and the degree A.M. for graduate work. Though the college is designed especially for Roman Catholic students, non-Catholics are admitted. The library contains over 50,000 volumes, including a select library for the special use of undergraduates; there are also a good scientific laboratory equipment and valuable mineralogical and zoological museums. There are no dormitories. The college has no endowment, and is dependent mainly upon its tuition fees for income. In 1907 Saint Ignatius College opened a department in law and was reincorporated under the name of Loyola University. Loyola University conducts departments in law, in engineering (two years), medicine (The Chicago College of Medicine and Surgery, 706 Lincoln street); sociology (Ashland Block) and two academies—Saint Ignatius Academy and Loyola Academy (Rogers Park). The attendance in all departments is 1,850.

SAINT IVES, ivz, England, seaport and watering resort, in Cornwall on Saint Ives Bay, 57 miles southwest of Plymouth. The parish church of Saint Andrew is in the Early Perpendicular style of the 15th century. The town-hall, a free library and a new pier are, with the harbor, the chief features of interest. Pop. about 7,000.

SAINT JACOB, or **SANKT JAKOB**, *sänt yä'köp*, Switzerland, a small village on the Birs in the canton of Basel, two miles southeast of Basel. It is noted for the important battle fought there on 26 Aug. 1444, between the Swiss Confederates and the Armagnacs, in which the latter were totally defeated.

SAINT JAMES' COFFEE-HOUSE, a famous Whig coffee-house of London which flourished from the time of Queen Anne until late in the reign of George III. It stood on Saint James' street in the neighborhood of Saint James' Palace, and was much frequented by Swift, Harley and other men of note in its early days. It was here that Goldsmith's poem 'Retaliation' originated. The poet, one of a group of men of talent who met here, was proverbially late in his arrivals. On one such occasion those present wrote in jest epitaphs "on the late Dr. Goldsmith." None is preserved save Garrick's which became famous:

Here lies poet Goldsmith, for shortness called Noll;
He wrote like an angel, but talked like poor Poll.

The retort above mentioned dealt in a satirical vein with the club members who had exercised their wit upon him.

SAINT JAMES' PALACE, England, a royal palace in London, between Saint James and Green parks. It was built originally for a hospital, reconstructed by Henry VIII, enlarged by Charles I. Henry VIII annexed to the palace a park enclosed by a brick wall, connecting it with Whitehall. Queen Mary died here in 1558; Charles I spent his last night in this palace; and here were born Charles II, the Old Pretender, and George IV. After Whitehall burned down in 1697, Saint James became the London residence of the sovereigns up to the time of Queen Victoria. It is still known as the Court of Saint James and is used for levees and drawing rooms. In 1837 Buckingham Palace became the royal home. The park covers 58 acres.

SAINT JEAN D'ACRE, *sän zhön dāk*r, Palestine. See **ACRE**.

SAINT JEROME DE MATANE, or **MATANE**. See **MATANE**.

SAINT JOHN, one of the 12 apostles of Jesus Christ. He and his brother James are often spoken of as sons of Zebedee. It is commonly accepted (cf. Mark xv, 40 and Matt. xxvii, 56) that his mother's name was Salome and it is still further conjectured by many (see John xix, 25) that she was a sister of Mary, the mother of Jesus — a relation which would render more natural the committing by Jesus of his mother to the care of John. The family seems to have possessed some means, as Zebedee employed hired servants in his fishing business; Salome is mentioned among the pious women who aided in the support of Jesus and his associates during his ministry and John himself was personally known to the high priest.

Of his early life we know nothing. Presumably he had the ordinary training of the Jewish boy of his time and no more. In the order of narration, he first appears, according to an obvious inference, as an unnamed disciple of John the Baptist, who with Andrew follows Jesus (John i, 35-39). After some association with Jesus, John returned to his occupation as a fisherman, from which Jesus summoned him

and his brother, together with Simon and Andrew, to discipleship, which was the basis of his appointment as one of the 12 apostles. In this company he was one of the three who were admitted to the closest intimacy with their Master and, indeed, is generally understood to be "the disciple whom Jesus loved." Little in particular is noted, however, in reference to him while Jesus lived. He and his brother are said to have been called "Boanerges," defined as "Sons of Thunder" (Mark iii, 17). While the meaning is somewhat obscure, it seems most probable that this hints at great stores of emotional power and passion. He, with his brother, is rebuked for proposing to summon fire from heaven to destroy the inhospitable Samaritan village, and he alone confesses attempting to check the activity of a healer who was not of their company. Only he of the apostolic company is mentioned as present at the trial of his Master and at his crucifixion, where he received the commission to care for Mary, the mother of Jesus, which he faithfully carried out, making a home for her till her death.

It appears from the statements in Acts and of Paul in his Epistle to the Galatians that for some time John remained in Jerusalem. Beyond this we are dependent upon tradition, which consistently associated the latest years of his life with the city of Ephesus. To be sure, on the basis of uncertain inferences from an obscure passage possibly incorrectly quoted by Eusebius from Papias, it has been argued by many scholars that all the tradition that John was at Ephesus was due to the confusion of the apostle with a supposed presbyter and original disciple of Jesus bearing the same name. But all the positive evidence tends toward the association of John in his latest years with Ephesus. There is a fragmentary tradition that he went to Rome and was there plunged into a cauldron of boiling oil, from which he miraculously escaped unharmed, and that he was then banished to an island. John, the author of the Apocalypse, speaks of himself as being "in the isle that is called Patmos," and the date which is given by Irenæus and others for the exile of John the apostle is late in the reign of Domitian, and for his return the year 96, early in the reign of Nerva. There is no tradition as to the date of his death. Many legends are current as to his life at Ephesus. Irenæus tells of his hostility to the tenets of the Gnostic Cerinthus, such that John even refused to remain under the same roof with the heretic. Clement of Alexandria exalts his pastoral fidelity by a story how he journeyed into the forest to reclaim a young man who had fallen into evil ways and joined a band of robbers. Cassian relates that when he was censured for spending time in play with a tame partridge, he answered that the bow cannot always be bent. The story, however, which is most familiar, is due to Jerome, who tells that, when so aged that he must be carried into church and was unable to speak at any length John would continually repeat, "Little children, love one another." Perhaps partly based on this story, partly perhaps on an impression gained from a superficial reading of his letters, the notion has widely prevailed that John was a weak sentimentalist. But this is unjust. It has been profoundly said of his epistles that their words are thunderpeals and it is plain that in his soul burned the fires of passion and

power which made him in his youth one of the "Sons of Thunder," although in his age he had learned repression and self-mastery.

DAVID FOSTER ESTES,
Professor of New Testament Interpretation,
Colgate University.

ST. JOHN, Charles Edward, American physicist: b. Allen, Mich., 15 March 1857. He was graduated at the Michigan Normal College in 1876 and studied physics at Harvard and at the University of Berlin. He became instructor of physics at Michigan Normal College in 1885; was made associate professor at Oberlin College in 1897 and in 1899 became professor of physics and astronomy at that institution. In 1907 he was appointed dean of the College of Arts and Sciences there. From 1908 he has been astronomer at the Mount Wilson Solar Observatory of Carnegie Institution. He is a member of various national astronomical societies. He has written 'Wave-Lengths of Electricity on Iron Wires' (1894); 'A Study of Silphium Perfoliatum and Dipsacus Laciniatus in Regard to Insects' (1887).

ST. JOHN, Frederick Edward Molyneux, Canadian journalist and author: b. Newcastle, England, 28 Nov. 1838. His father was one of Wellington's veterans at the battle of Waterloo and the son followed him in a military career, on 23 April 1855 entering the Royal Marines (Light Infantry) as second lieutenant. He served under General Van Straubenzie throughout the operations against Canton in 1857-58 and acted with such gallantry under fire during the storming of the fort that in August 1858 he was promoted first lieutenant. In 1868 he came to Canada and being a member of the staff of the *Toronto Globe* was appointed in 1870 to accompany Colonel Wolseley's Red River expedition and later served with Lord Dufferin on his tour of British Columbia. Upon the forming of the Northwest Territories, he became the first clerk of the legislature, the first secretary of the Protestant board of education and later was appointed sheriff and Indian commissioner. In 1879 he returned to England, where in 1884 he became the first emigration agent and London secretary to the Canadian Pacific Railway. He was at different times editor of the *Winnipeg Standard*, the *Montreal Herald* and the *Manitoba Free Press* and in 1888 was president of the Ottawa Press Gallery. He has published 'A Sea of Mountains,' an account of Lord Dufferin's tour (1877); and 'Under the Mistletoe,' a society play.

ST. JOHN, Henry. See BOLINGBROKE, VISCOUNT.

ST. JOHN, James Augustus, English author and traveler: b. Carmarthenshire, Wales, 24 Sept. 1801; d. London, 22 Sept. 1875. At 16 he went to London and engaged in newspaper work and in 1827 started the *Weekly Review*.

He lived much of his life abroad, in France, Switzerland, Egypt and elsewhere and found material in his travels for many of his works. He contributed to 'Constable's Miscellany' in 1830 a 'Journal of a Residence in Normandy' and wrote 'Egypt and Mohammed Ali' (1834); 'Anatomy of Society' (1831); 'Manners and Customs of Ancient Greece' (1842); 'Egypt and Nubia' (1845); 'Views in the Eastern Archipelago' (1847); 'Isis, an Egyptian Pilgrimage' (1853); 'Philosophy at the Foot of the Cross' (1854); 'Nemesis of Power' (1854); 'Preaching of Christ' (1856). He also wrote 'Lives of Celebrated Travelers' (1831); a biography of 'Louis Napoleon' (1857); an elaborate 'Life of Sir Walter Raleigh' (1868-69), etc.

ST. JOHN, John Pierce, American governor and prohibitionist: b. Brookville, Ind., 25 Feb. 1833; d. Olathe, Kan., 31 Aug. 1916. He went to California in 1853; later traveled in Mexico, Central and South America and Hawaii; and fought in Indian wars in Oregon. He served in the Union Army in 1862-65, attaining rank of lieutenant-colonel and subsequently removed to Missouri, where he engaged in law practice. In 1869 he settled at Olathe, Kan., and in 1879-83 he was governor of Kansas. He was Prohibition candidate for President in 1884, but in the first Bryan campaign affiliated himself with the Democratic party. He toured Kansas for woman suffrage in 1912 and in 1914 went on a speech-making tour of the East in behalf of prohibition.

ST. JOHN, Sir Spencer, English diplomat, son of J. A. St. John (q.v.): b. London, 22 Dec. 1825; d. Camberley, Surrey, 2 Jan. 1910. In 1848 he was appointed secretary to Sir James Brooke in Borneo, in 1850 became secretary to the mission to Siam and during 1856-61 was consul-general in Borneo. During the years 1863-96 he was consul successively in Haiti, Lima, Bolivia, Mexico and Stockholm. He was created K. C. M. G. in 1881. He has published 'Life in the Forests of the Far East' (1862); 'Life of Sir James Brooke, Rajah of Sarawak' (1878); 'Haiti, or the Black Republic' (1885); 'Rajah Brooke, (1899); 'Adventures of a Naval Officer' (1905); 'Earlier Adventures' (1906); 'Essays on Shakespeare and his Works' (1908).

SAINT JOHN, one of the Virgin Islands, formerly Danish West Indies, lying east of Saint Thomas (q.v.), area, 21 square miles. It is of volcanic origin and hilly; only a small portion of the land is cultivated; sugar is the chief agricultural product. Cattle are raised and exported and bay rum is also exported. Coral Bay, on the east coast, is one of the best sheltered and safest harbors of refuge during hurricanes in the Antilles. By the terms of a treaty with the United States, ratified by the Danish parliament 22 Dec. 1916, the entire Danish West Indies, for and in consideration of the sum of \$10,000,000, passed into the possession of the United States and are now administered by it. Pop. 925. See WEST INDIES, DANISH.

SAINT JOHN, British West Indies, the capital of Antigua, situated on the northwest coast, stands at the head of a safe but small bay. The residence of the English governor-

in-chief is the principal building. The staple of the island is sugar, which, together with pine-apples, forms the chief export trade.

SAINT JOHN, Canada, city and county-seat of Saint John County, New Brunswick, situated at the mouth of the Saint John River on the shores of the Bay of Fundy; on Canadian Government, Canadian Pacific and New Brunswick Southern railroads, 450 miles from Boston, 480 from Montreal and 275 from Halifax. It is the Atlantic terminus of the Canadian Pacific Railway.

Shipping Interests.—The harbor of Saint John has ample accommodations for ships of large tonnage. It has always been the principal port in New Brunswick for the shipment of lumber, for it commands the trade of the Saint John River and its tributaries, which flow through one of the great forest regions of the continent. The port is becoming the great winter port of Canada and there are now three grain elevators, and connected with them berths for seven large steamships which can all load or discharge at the same time. Other wharves are being built for the growing trade of the port, the exports of which amounted in 1916-17 to \$190,586,561. The development of the West is making Saint John a very important shipping port and the outlet for a large proportion of the products of the great prairie region beyond Lake Superior. During the year the sea-going vessels entering and cleared at Saint John numbered 2,161, totaling 2,336,614 tons. Lines of steamships run from Saint John to Great Britain during the winter and there are regular sailings to the West Indies.

Saint John has steamboat connection with Portland, Me., Boston, Digby, Yarmouth, Grand Manan and other points on the sea coast, and with Fredericton and other points on the river.

Business Interests.—Saint John has become a considerable manufacturing centre, and has cotton mills, iron and brass foundries, elevators, saw and pulp mills, nail factories, rolling mills, a broom and brush factory, flour mills, sugar refining plant and many other industries. Saint John is the only city in Canada which owns its own harbor.

Public Works, Buildings, etc.—Saint John has an electric railway system, electric lighting and a splendid water and sewerage system. It has a large public hospital, fine modern school-houses, exhibition buildings, free public library, and other public buildings of a similar character. Its custom-house is said to be one of the finest in the world. The city has about 44 churches.

History, Population, etc.—The Saint John River received its name from Champlain, who visited it in the year 1604, and it was at that time the site of an Indian town. The French held possession of the country until the year 1713, when Acadia was ceded to Great Britain under the Treaty of Utrecht. A fort was built in 1630 by Charles La Tour on the west side of the harbor, which was afterward from time to time occupied by garrisons until the year 1700, when it was allowed to fall into ruin for about half a century. About the year 1758, however, it was taken possession of by the English, rebuilt and named Fort Frederick. The first English settlement at Saint John was in 1762, when Messrs. Simonds, Hazen and White be-

gan business at what is now called Portland Point, engaging in the fisheries and in the manufacture of lime. In 1783, Saint John received a large accession to its population by the coming of the Loyalists, who had left the old Thirteen Colonies after the establishment of their independence. Saint John received a charter and became a city in 1785; it was the first city in Canada to adopt the commission form of government. Pop. 61,380.

JAMES HANNAY,

Author of 'New Brunswick: Its Resources and Advantages.'

SAINT JOHN, Knights Hospitallers of.
See JOHN, ORDER OF SAINT.

SAINT JOHN, Lake, Canada, in the Chicoutimi district, Quebec, 200 miles by rail north of Quebec, a circular body of water, about 28 miles long and 25 miles broad, drained by the Saguenay River (q.v.). It receives the waters of the Metabetchouan, the Mistassini, the Peribonca, the Ashuapmouchouan, the Oujatchouan and several smaller streams.

SAINT JOHN RIVER, Canada, the largest river of the province of New Brunswick, has its source in the highlands of northern Maine. After a course of 390 miles, it empties into the Bay of Fundy through a rocky gorge about 600 feet wide, having a total fall of about 17 feet. Throughout most of its upper course it forms the boundary between Maine and Canada. It is navigable for steamers of considerable size as far as Fredericton, a distance of 84 miles, while small steamers ascend to Woodstock, 145 miles.

SAINT JOHNS, Mich., village, county-seat of Clinton County, on the Detroit, Grand Haven and Milwaukee Railroad, about 20 miles north of Lansing and 100 miles west-northwest of Detroit. It is in an agricultural region and it has considerable manufacturing interests. The chief manufactories are a large table factory, grist mills, lumber mills, carriage works, machine shop and foundry. There is considerable trade in manufactures and farm products. The educational institutions are a high school, public graded school and a library, which is under the auspices of the Ladies' Library Association. Pop. 3,154.

SAINT JOHN'S, Newfoundland, the capital of the colony, situated on the east side of the island, on the Atlantic Coast, midway between Cape Race and Cape Bonavista, in lat. 47° 33' 54" N., and long. 52° 40' 18" W. It is distant 1,691 miles from Cape Clear (Ireland), 1,213 from New York, 885 from Boston, and 488 from Halifax, Nova Scotia. The harbor is completely land-locked, with good holding ground, and is entered by a short passage, known as the "Narrows," between high beetling cliffs. The town is situated on the north side of the harbor.

Communication.—Saint John's is the terminus of the Newfoundland Railway, which runs across the island to Port Aux Basques. Steamship lines connect with New York, Philadelphia, Montreal and Sydney, Cape Breton, and in normal times with Liverpool and Glasgow. Constant communication is maintained with all parts of Newfoundland and Labrador by the fine steamers of the Bowring and Reid Lines.

SAINT JOHN'S, N. F.

1 Parliament House

2 The Governor's Residence

Each bay has also a local steamer running in connection with the railway.

Shipping Interests.—Saint John's is not only the capital of the colony but the centre of all the business and financial interests of the island and Labrador. Three Canadian banks, Bank of Montreal, Bank of Nova Scotia and Royal Bank, have their headquarters in the city. All the principal merchants reside here, all the supplies for the chief business, the fishery, are bought in Saint John's, and the great bulk of the exports shipped from the capital, 90 per cent of the duties being paid and the revenue collected in Saint John's.

At the head of Saint John's Harbor there is a splendid dry dock, built by the government, but now leased to the Reid Newfoundland Company. It is capable of taking up the largest ships. There is ample warehouse room and the Reid repairing shops are equipped with all the best modern machinery.

Manufactures.—There are several important factories, one of the largest being a ropewalk, also biscuit factories, oleomargarine factories, tanneries, breweries, lumber factories, foundries, a large tobacco factory and an extensive boot and shoe factory, with several minor establishments. The most extensive business is connected with the curing and drying of codfish for foreign markets, the exports of this fish in 1916-17 being valued at nearly \$13,000,000. Seal, cod and whale oil are manufactured and guano from the whale refuse. Between 300,000 and 400,000 skins of the hair seal are in normal times sold to be manufactured into leather and fur abroad.

Public Works, Buildings, Etc.—The capital of Newfoundland has an electric railway, electric light and owing to recent improvements one of the finest water services of any town in America. There are very complete telephone and telegraph lines, one belonging to the Anglo-American Telegraph Company, the other to the local government. The town possesses a large public hospital, convalescent home, lunatic asylum, poorhouse, a large Roman Catholic cathedral, and an Anglican cathedral, one of the most beautiful of churches, a masterpiece of the late Gilbert Scott, which has lately been restored after being destroyed by fire in 1892. The customs-house and courthouse are commodious but not picturesque. Government house has fine grounds, but the building is very plain. There are also fine schools and churches.

Education.—Education is strictly denominational, even the Salvation Army having separate schools. The Anglican, Roman Catholic and Wesleyan bodies have very fine colleges and good schools, but no university.

History.—Owing to its unrivaled position in the centre of the great cod-fishing grounds Saint John's became, from the date of the discovery of North America in 1497, the centre and metropolis of this great industry. The date of its foundation cannot be exactly determined. Its first inhabitants were part of the fishing ships' crews left behind to build boats, houses, stages, etc., for the fishery. There were 20 houses in Saint John's in 1540. In 1583, Hayes, the survivor of Gilbert's ill-fated expedition, speaks of the town as a "place very populous and much frequented." A large barter trade was carried on between the French, Portuguese, Spanish Basques and the English fishermen,

the principal traffic consisting in selling for cash, or bartering for fish and oil. Mediterranean products, salt, olive oil, fruits, wines, etc., were exchanged for the then as now famous West of England cloth, cordage, cloth caps and hosiery and the well-known Sheffield cutlery. There were 20,000 men engaged in this early transatlantic fishery, and the trade was one of the most important of the Tudor Age. The American colonists began trading with Newfoundland as early as 1641. By the time of the Revolution, Saint John's did a business of \$4,000,000 with the United States, mainly through Boston and New England.

The town was twice captured by the French and destroyed by them and their Indian allies. It was recaptured in 1762, by Colonel William Amherst, with the Highlanders and Royal Americans, the last and most gallant fight of the great Seven Years' War. Saint John's was built entirely of wood and has been several times utterly destroyed by fire, once in 1817, again in 1846 and partially in 1892. It has been greatly improved of late years and is now built chiefly of stone and brick, and is a well-laid-out city.

Government and Population.—Saint John's is governed by an elected mayor and an elected municipal council of six members. The population numbers about 32,292; nearly one-half are Roman Catholics.

D. W. PROWSE,
Author of 'The History of Newfoundland, from the Records.'

SAINT JOHNS, Quebec, a town, the county-seat of Saint Johns County, situated on the Richelieu River, 27 miles southeast of Montreal. It is a port of entry and a station on the Grand Trunk, Canadian Pacific and Central Vermont railroads. It has a high school, college, convent and hospital and military school. The principal manufactures are earthenware and linen and silk goods. Large quantities of lumber and agricultural products from the lower Champlain region are exported through Saint Johns. Saint Johns is connected with Iberville by a steel bridge; the combined population is 12,000.

SAINT JOHNS, a river in Florida; the source, Lake Poinsett in Orange County, is about 12 miles from the Atlantic Ocean. The river flows north, nearly parallel with the coast, and enters the Atlantic about 15 miles northeast of Jacksonville. The total length is about 350 miles. It flows through swamps, ponds and lakes; luxuriant vegetation is along its banks the greater part of the course. In some places are large trees, their green foliage intermingled with feathery brown and gray mosses which hang down to the ground. Reptiles are numerous in the marshes. In the north part of its course the land is higher and dryer. It is navigable to Enterprise in Volusia County. See FLORIDA.

SAINT JOHN'S BREAD. See CAROB.

SAINT JOHN'S COLLEGE, Cambridge, England, was founded by Margaret, countess of Richmond and Derby, mother of King Henry VII, in 1511 mainly through the exertions of Fisher, bishop of Rochester, then chancellor of the university, who raised sufficient funds to endow 32 fellowships. The college replaced Saint John's Hospital founded in

the 12th century, and now consists of a master, at least 56 fellows, 60 foundation scholars and nine sizars; both fellowships and scholarships being open to all British subjects. Five fellowships are professorial fellowships to be held by professors of the university. There are three divinity studentships of the value of about \$400, tenable for three years, and open to the competition of bachelors of arts not of sufficient standing to take the degree of M.A.; also four law studentships of the value of \$450, tenable for four years; and a Hebrew scholarship of the value of \$160, tenable for three years. Some \$33,500 are expended annually in assisting deserving students of the college, and there are a number of prizes which are awarded on the results of the annual examinations. The college has the patronage of 52 church livings. The buildings include four courts chiefly of brick; the new court (1826) across the Cam, built of stone, is united by an ornamental covered bridge, commonly called the "bridge of sighs," with the third court. The chapel (1869) is by Sir Gilbert Scott, and is a fine specimen of the Early Decorated style. The combination-room, 93 feet long, and the library (1623) are curious and striking. Ascham, Ben Jonson, Bentley, Rowland Hill, Wilberforce, Wordsworth and Lord Palmerston were members of the college.

SAINT JOHN'S COLLEGE, Oxford, England, a college founded in 1555 by Sir Thomas White, a London alderman, for a president, 50 fellows and scholars, a chaplain, an organist, six singing men, eight choristers and two sextons. Some of the buildings belong to the earlier college or Saint Bernard dating from about the middle of the 15th century. With buildings added at subsequent dates the whole forms a picturesque group. Under the present statutes the college consists of: (1) Not less than 14 nor more than 18 fellowships, of which seven may be official fellowships, the rest tenable for seven years. To these may at future times be added two ex-officio fellowships to be held by the Laudian professor of Arabic and the professor of civil engineering. (2) Not less than 28 scholarships, of which six shall be open, 15 appropriated to Merchant Tailors' School, two to Coventry School, two to Bristol School, two to Reading School and one to Tunbridge School. (3) Four senior scholarships confined to former pupils of Merchant Tailors' School. There are also the Holmes Scholarship, tenable for five years; the Lambe Scholarship, tenable for four years; the four Casberd scholarships of \$400 each per annum, and certain exhibitions for undergraduates not on any foundation, and of at least one year's standing in the college. There are also four fellowships, tenable for 14 years, open with certain limitations and under certain conditions in respect of literary proficiency, first to the kindred of the founder, Dudley Fereday of Ettingshall Park, Stafford, secondly to natives of Staffordshire, and then to any other person whatsoever. Thirty-three church livings are in the patronage of the college.

SAINT JOHN'S COLLEGE, located at Annapolis, Md. It was chartered in 1784 and opened to students in 1789, but is the direct successor of King William's School (founded

1696), which in 1784 was merged into the college, thus being one of the oldest institutions of collegiate grade in the United States. The work of the collegiate department is arranged in four courses, classical, Latin-scientific, scientific and mechanical engineering; in each course certain studies are required and others are elective. The degree of A.B. is conferred for the completion of the classical and Latin-scientific courses; the degree of B.S. for the scientific and mechanical engineering courses. Graduate work is provided for, leading to the degree of A.M., and there is a preparatory school. Instruction in military science and military drill is a part of the curriculum and obligatory for all students. The State provides one full State scholarship for each senatorial district, and in addition 26 scholarships for tuition only, to be distributed among the counties in order of priority of application; there are also other scholarships. In 1904 the grounds and buildings were valued at over \$250,000; Henry Williams Woodward Hall, the new science building, was erected in 1900; the library contains about 10,000 volumes. The annual income recently was about \$70,000; the students number about 200, and the faculty 14.

SAINT JOHN'S COLLEGE, an institution in New York, opened 24 July 1841, under the auspices of the Roman Catholic Church. For its history and present development see **FORDHAM UNIVERSITY**.

SAINT JOHN'S EVE. See **JOHN'S, EVE OF SAINT**.

SAINT JOHN'S RIVER, Quebec, the local name near the town of Saint John, of the Richelieu River (q.v.).

SAINT JOHN'S UNIVERSITY, Collegeville, Minn., founded in 1857 and chartered the same year, is a Roman Catholic institution in charge of the Order of Saint Benedict. In 1869 the school was granted power to give degrees; and in 1878 it was further empowered by Leo XIII to grant the degrees of doctors in theology, philosophy and canon law. In 1883 it received from the legislature of Minnesota the title of University. The institution comprises preparatory, commercial, academic or high school departments; the school of arts and sciences or collegiate department; and the theological school or seminary department. The courses lead to the degrees of B.A., M.A. and Ph.D. The location of Saint John's is ideal, the grounds comprise over 100 acres and the buildings are massive and imposing structures. The average annual attendance of students is 350 to 380; the faculty numbers 59.

SAINT JOHN'S UNIVERSITY, Toledo, Ohio, under the direction of the Fathers of the Society of Jesus was opened in September 1898 and as "The Saint John's College of Toledo, Ohio," was incorporated 22 May 1900. On 29 Aug. 1903 with the corporate title changed to "The Saint John's University of Toledo, Ohio," the power to grant degrees under an amended charter, was ratified by the Secretary of State. Well equipped buildings and grounds offer all possible facilities for higher education. An undergraduate department consists of a four years' course in the study of English composition and literature, Latin and

Greek, German, French, history, algebra and the principal business courses. The collegiate course extending through four years, is known as the college course of liberal arts, which, including mathematics, natural science, a higher course in religion, a study of history, foreign languages and a course in mental philosophy leads to the degrees of B.A., B.S., Litt.B. and Ph.B. A law department also offers a three years' course of studies necessary for admission to the Bar. The average annual attendance of students is from 300 to 350; the faculty numbers 23.

SAINT JOHN'S-WORT, a large genus (*Hypericum*) of plants of the family *Hypericaceæ*. They are to be found nearly everywhere in the temperate and torrid zones, and are often shrubs or small trees. The foliage is pellucid punctate or black-dotted and the leaves and blossoms emit, when bruised, a strong resinous-aromatic odor, and have a bitter taste, due to an oil possessing astringent and tonic properties, and which held a prominent place in old pharmacopeias. The flowers are perfect and numerous, borne solitary or in cymose panicles and are generally yellow. *Hypericum perforatum*, to which formerly the name of Saint John's-wort was limited, has its leaves marked with pellucid dots, somewhat simulating perforations. It is a European plant which has become naturalized in our country, and is a troublesome weed. It is a very smooth, shining herb, sometimes two feet high, with opposite oblong leaves and bright-yellow flowers in broad terminal cymes. Both petals and leaves are black-dotted. Its yellow, acrid, resinous juice will stain the skin purple and was believed by Dr. Torrey to cause inflammatory trouble in cattle. The dried plant dyed wool yellow.

Tradition states that the Saint John's-wort was so called because blood-like spots appeared on its foliage immediately after the Saint was beheaded and reappeared on the anniversary of the date. It was regarded as a universal panacea and perhaps possessed some curative qualities, especially in external use. It was supposed to preserve persons and property against lightning, but was still more in demand as a preventive of witch-visits or those of other evil spirits, perhaps because, according to tradition, a baptized person anointing the eyes with the green juice of its inner bark could see witches. Italians gave it the name of "devil-chaser." It was not only worn as an amulet, but was hung over doors and windows; yet it was not safe to tread on it after dark, since the luckless wight that bruised it might be snatched up on a fairy horse and carried about all night. Saint John's-wort, plucked on midsummer night's eve, took its place among the love-charms.

SAINT JOHNSBURY, Vt., town, county-seat of Caledonia County, on the Passumpsic River, and on the Boston and Maine and the Saint Johnsbury and Lake Champlain railroads, about 34 miles east-northeast of Montpelier. It was settled in 1786 by Jonathan Arnold and associates, and incorporated in 1884. It is in an agricultural region in which there is considerable attention given to dairying; but the principal industry is the manufacturing of the Fairbanks scales. There are about 1,000 men employed in the Fairbanks Scales Works and an equal number in the combined smaller manu-

factories. There are nine churches and one hospital. The educational institutions are the Saint Johnsbury Academy, Notre Dame Academy, public and parish schools, Saint Johnsbury Athenæum and a free library, and the Fairbanks Museum of Natural History. The four banks have a combined capital and deposits of \$2,000,000. The government is vested in a board of trustees. Pop. 8,098.

SAINT JOHNSVILLE, N. Y., village in Montgomery County, 55 miles west of Albany, on the north bank of the Mohawk River, and on the New York State Barge Canal and the New York Central Railroad. It manufactures threshing machinery, gas engines, motors and piano actions, and has knitting mills and milk condenseries. Pop. 2,536.

SAINT JOSEPH, Mich., city, county-seat of Berrien County, on Lake Michigan, at the mouth of the Saint Joseph River, on the Cleveland, Cincinnati, Chicago and Saint Louis, the Pere Marquette and the Michigan Central railroads, about two miles south of Benton Harbor and 23 miles north by west of Niles. It has steamer connection with the Lake Michigan ports, including Chicago, by means of the Graham and Morton Transportation Company and the Benton Transit Company, and is an attractive summer vacation resort. It is in an agricultural region, noted for its peaches and other fruit. The chief industrial establishments are flour and grist mills, fruit-basket and box factories, machine shops, foundries and hosiery mills. The educational institutions are a high school, public elementary schools, parochial schools and a public library. Mineral baths, Silver Beach and Lake Front parks, Berrien County Country and the Edgewater clubs add to the city's attractiveness. Its history dates back to Father Allonez's visit in 1669 and to a mission and small fort founded in 1700 and destroyed by Pontiac in 1762. Finally settled in 1829 it was incorporated as a village in 1836 and as a city in 1892. Pop. 7,500.

SAINT JOSEPH, Mo., city and county-seat of Buchanan County, the third city in size and wealth in Missouri, 131 miles southeast of Omaha and 60 miles north of Kansas City, is situated on the east bank of the Missouri River, in Northwestern Missouri, near the junction of the four States of Missouri, Kansas, Nebraska and Iowa, and is the central gateway of the lower group of Missouri River cities. The city extending for three miles along the river front stands on high rolling ground, entirely above and free from floods or overflow, and covers an area of about 13 square miles. Elwood, Kan., a residential suburb, is reached by a steel railroad bridge 4,270 feet long. With its slightly hills, winding avenues, parks, lake and driveways, Saint Joseph is a picturesque, healthful and desirable place of residence. The railroads serving Saint Joseph are the Santa Fé System, Burlington Route, Rock Island Lines, Chicago Great Western, Missouri Pacific System, Saint Joseph and Grand Island Railroad (Union Pacific System). Through their immediate connections Saint Joseph is served by every mile of railroad in the Northwest, Southwest and Central West. Two electrical inter-urban lines operate from Saint Joseph into the

surrounding districts — both passenger and freight.

As compared with other cities in the United States, Saint Joseph stands among the first in bank transactions according to population; third as a dry-goods jobbing centre; fifth largest livestock market; seventh largest candy manufacturing centre; and has the largest and best hard winter-wheat mill in the world.

Predominating Industries.—The leading industrial and commercial activities of Saint Joseph are manufacturing, merchandise distribution and livestock and grain marketing. The development of manufacturing in Saint Joseph has been steady and progressive. The principal manufactures are packing-house products, milling products, clothing, candy, shoes, dairy products, harness and saddlery tanning, foundry and machine-shop products, furniture, trunks, soap and glue. The annual value of manufactured products is \$110,000,000; value of merchandise sold at wholesale and jobbing annually, \$100,000,000; value of farm products marketed annually, \$200,000,000; commercial freight received and forwarded annually amounts to 2,750,000 tons. The post-office receipts (1918) were \$502,320.20; bank clearings (1918) \$991,532,996; total bank transactions (1918) \$4,935,993,907. Eighteen bank and trust companies transact business in Saint Joseph.

Stock Yards.—A great impetus was given to the growth and prosperity of the city by the improvements and extensions made at the stock yards, which were begun in the year 1897. The stock yards proper consist of 500 acres of land, 80 acres of which are covered by the pens and sheds. There are 20 miles of railroad tracks upon the grounds and five packing-houses engaged in the slaughtering of animals, three of them, Swift and Company, Morris and Company and the Hammond Packing Company, erected large and extensive plants here at a cost of several millions of dollars.

Public Buildings.—Chief of these are the county courthouse, the Federal building and post-office, the union railway station, the auditorium, livestock exchange, the Corby-Forsee building, housing the Commerce Club, the Central Washington Park and Carnegie libraries; 43 school buildings, of which the most important are the Robidoux, Beaton and La Fayette high schools, and central high school and junior college. Other important buildings are those of the Young Men's and the Young Women's Christian associations, Scottish Rite Cathedral, Masonic Temple, the Home for Little Wanderers, the Buchanan or No. 2 State Hospital for the Insane, the Sisters of Saint Joseph, the Noyes and Ensworth hospitals and the numerous fine church structures of different sects. Attractive city features include Krug Park, Bartlett Park, Noyes Boulevard, Lake Contrary, the State fish hatchery, government weather observatory, two large opera houses, theatres and numerous places of amusement.

Government and Civic Conditions.—The commission form of government is in force in Saint Joseph. The city owns an electric-light plant, representing in its original construction an expenditure of over \$100,000, since enlarged to twice its present capacity in order to meet the demands for additional street lighting, re-

sultant from the growth of the municipality; cheap fuel is furnished by natural gas. The gas plant, which was built in 1878 and has been in almost continuous extension and improvement since that time, now represents an investment of about \$1,000,000. It has in use 56 miles of main pipe and has a capacity of furnishing 2,000,000 cubic feet of gas every 24 hours. Saint Joseph is supplied with water through an extensive system of waterworks, first built in 1879 and improved and extended since that time, until it now represents in cost of construction an expenditure over \$1,800,000. The assessed valuation of property in the city, made upon a basis of about 60 per cent of its actual value, is \$53,624,970; the city's bonded indebtedness is \$722,550; the tax rate is \$1.25 per \$100. There is no floating debt, this being prohibited by city charter. For maintenance and operation the city expends annually an average of \$1,200,000; the principal items being education, \$500,000; fire department, \$157,000; police department, \$130,000; streets, \$120,000; water, \$50,000; lighting, \$34,000.

History.—In 1826, Joseph Robidoux, born in Saint Louis of French parentage, established a trading post at this point, known as the "Blacksnake Hills," and thus became the founder of the city, which he later christened with his own name. For hundreds of miles on every side the whole country was then an unbroken wilderness, inhabited only by the aborigines, who gained a scanty subsistence by trapping and hunting. The furs and pelts of the wild animals they killed soon became a source of extensive traffic between the trader and his Indian neighbors. The famous "Platte Purchase" was accomplished through a treaty with the Indians, dated 17 Sept. 1836. The trading post grew into a town, incorporated in 1845 and then into a city, incorporated in 1851. Its growth at first was not rapid, but steady and gradual. Planted, however, in the midst of one of the finest and wealthiest agricultural sections of the United States, and drawing to itself the larger part of the trade that came from the country to the westward, it later on began to assume a more vigorous and rapid growth. In 1880 it had a population of 32,431; (1890) 52,324; (1910) 77,403; (1919) 90,000.

Bibliography.—Barns, 'The Commonwealth of Missouri' (1877); 'Encyclopedia of the History of Missouri' (1901); 'History of Buchanan County, Missouri' (1881); 'Buchanan County and Saint Joseph' (1898); 'Saint Joseph Directory' (1903).

H. D. ENNIS,

Secretary of the Commerce Club of Saint Joseph.

SAINT JOSEPH, an island in Lake Huron belonging to Canada. It is at the mouth of Saint Mary's River and near the mainland of both Michigan and Ontario. There are many high bluffs and large rocks on the coast, but nearby the whole of the surface is covered with trees, shrubs and flowers.

SAINT JOSEPH, (1) A river in Michigan whose source is in Hillsdale County. It flows west-northwest, then south into Indiana, west, then northwest, returning to Michigan and entering Lake Michigan at Saint Joseph (q.v.). South Bend, Ind., is on the banks of this river,

at the head of navigation. Its total length is about 250 miles. (2) Another river of the same name rises in the southwestern part of Michigan, crosses the northwestern corner of Ohio, enters Indiana and flows southwest and unites with Saint Mary's River at Fort Wayne, to form the Maumee (q.v.). Its total length is about 100 miles.

SAINT JOSEPH'S SEMINARY, a theological school at Yonkers, N. Y. The local name for the place is Dunwoodie. The seminary belongs to the archdiocese of New York, but the attendance is not limited to any locality. The history of the school begins as far back as 1833, when Bishop Dubois began at Nyack, N. Y., the erection of a school on the plan of Mount Saint Mary's (q.v.), Emmitsburg, Md. The corner stone was laid 29 May 1833, but the institution was destroyed by fire before it was finished. Later the project of establishing the school in Brooklyn was proposed, but soon abandoned. The next location, selected by Bishop Hughes, was Lafargeville, Jefferson County, N. Y. A school was opened here, 20 Sept. 1838; but it was soon abandoned, as it was too far from New York. The Lafargeville school was intended for both theological and secular studies. The school was removed to Fordham, N. Y., in 1840 and is now known as Saint John's College. The theological department was moved, October 1864, to a new home and Saint Joseph's Seminary, Troy, N. Y., was opened in charge of professors from the University of Louvain, Belgium. The present seminary at Yonkers is on a beautiful tract of land and built on the eminence known in history as Valentine Hill. The land was purchased in 1890 by Archbishop Corrigan (q.v.), and the new seminary was dedicated 12 Aug. 1896 and placed in charge of the Sulpician Fathers. In May 1898, one of the gifts presented to Archbishop Corrigan in honor of his silver jubilee was the certificate of the entire liquidation of the debt upon the seminary. The seminary chapel was built entirely at the personal expense of Archbishop Corrigan.

The conditions for admission are (1) a well-formed desire to study for the priesthood, (2) entrance examination, (3) must have completed a good classical course, (4) the permission of the bishop of the diocese to which the applicant belongs. The courses of study demand a large amount of work: as, the course in Sacred Scripture is for five and one-half years and the regular class work is supplemented by an academy or seminary composed of interested students who meet once a week to discuss particular questions. In connection with this department there are two courses of Hebrew and instructions are given in other Semitic languages. All the other courses are equally thorough. In addition the students regularly visit hospitals, penal and charitable institutions and teach in Sunday schools. In 1917 there were connected with the seminary 13 professors and instructors and 246 students. The library, in the centre of the main building, contains about 30,000 bound volumes.

SAINT-JUST, sǎn zhüst, **Antoine Louis de**, French patriot: b. Decize (Nièvre) 25 Aug. 1767; d. Paris, 28 July 1794. He studied law at Rheims, but devoted himself almost exclusively to literary pursuits until the outbreak of

the Revolution, when he became one of its most notable participants. His political career as deputy from Aisne to the convention at Paris in 1792 began with his famous oration setting forth his reasons for voting for the death of Louis XVI. Because of his youth he has been called the instrument of Robespierre, with whom he was closely associated throughout the Revolution. But the extreme measures attributed to him were undoubtedly undertaken through intensity of personal conviction. In 1793 he was made president of the convention, and in 1794 was responsible for the execution of Danton, Hébert and Desmoulins. But the Revolutionary Tribunal, whose acts he had so mercilessly directed, was destined to be dissolved. In July 1794 Robespierre and Saint-Just were executed upon the same scaffold by order of the Committee of Public Safety. The political works of Saint-Just were published in 1833-34. Consult Fleury, 'Saint-Just et la Terreur' (1851); Hamel, 'Histoire de Saint-Just' (1859); Aulard, 'Les orateurs de la législative et de la convention' (1885).

SAINT KILDA, Scotland, an island of the outer Hebrides, belonging to Harris in Inverness-shire and lying 40 miles west of North Uist. It is three miles long by one mile broad with shores rising in perpendicular cliffs from the water's edge. The highest point is Conna-Ghair, a gigantic precipice 1,220 feet high. The richness of the verdure softens an otherwise bleak and forbidding landscape. There are about 40 acres of arable land and sheep are raised. Sea-birds, petrels, etc., which supply feathers, oil and meat, form the chief source of income. The fisheries are productive but neglected. The population from 110 in 1851 had dwindled to 77 some 50 years later. The natives speak Gaelic and inhabit a little village at the head of East Bay.

SAINT KITTS, West Indies. See **SAINT CHRISTOPHER**.

SAINT-LAMBERT, Jean François, zhôn frân-swā sǎn lǎn-bār, **MARQUIS DE**, French philosopher and poet: b. Nancy, France, 26 Dec. 1716; d. Paris, 9 Feb. 1803. He was for many years attached to the court of Stanislaus Leszczyński of Poland when that prince lived in Lorraine, and for a time he served in the French army. He won literary recognition by a volume of descriptive verse, 'Les saisons' (1796), which received extravagant praise at the time but possessed little merit. His present fame seems to rest upon the fact that he was the successful rival in love of both Voltaire and Rousseau. His 'Fugitive Poems' (1759) and 'Stories' (republished 1883) possess considerable merit and his 'Universal Catechism,' though somewhat materialistic, was approved as a text-book on ethics by the Institute in 1810.

SAINT LAMBERT, Canada, town of the province of Quebec, opposite Montreal, with which it is connected by the Victoria Bridge across the Saint Lawrence River and on the Grand Trunk Railway. It has both Protestant and Roman Catholic academies. Pop. 3,344.

SAINT LAWRENCE, là'rěns, an island belonging to Alaska, in Bering Sea, intersected by long. 170° W. and lat. 63° N. It is about 100 miles long and varies from 10 to 35 miles in width; it is about 500 feet at the highest point

above the sea, though some of the mountain peaks attain a height of some 2,000 feet. It is inhabited by Eskimos who are engaged chiefly in fishing.

SAINT LAWRENCE, Cape, Canada, the northwest projection of Cape Breton Island, Nova Scotia, on the Gulf of Saint Lawrence.

SAINT LAWRENCE CANALS. See CANADIAN CANALS.

SAINT LAWRENCE RIVER AND GULF. The Saint Lawrence River is in North America; its head-waters are about long. 93° W., and its mouth near long. 66° W. The total length from the source of the Saint Louis in Minnesota to its entrance to the Gulf of Saint Lawrence at Anticosti Island is about 2,200 miles. The area of the basin is about 530,000 square miles. The area of the water surface of the Saint Lawrence River system, including all the rivers and lakes, is 95,300 square miles. The area of that portion of the basin which is drained by the Great Lakes is nearly 200,000 square miles. The length of the shore line of the Great Lakes and their rivers is 5,400 miles. This system is the only large one in North America whose main stream flows from west to east and the only large system, except Columbia, whose main stream does not run in the direction of the greatest extent of the continent.

Formation of Lakes.—Prior to the Glacial period the land area of this region was greater than at present and broad valleys were excavated by the rivers. With but few exceptions the last formed rocks in this great depressed region belong to the latest formations of the Palæozoic strata. The whole region was under ice-cover during the Glacial period. This vast body of ice moved southward, elevations were worn down, the rocks were carved in fantastic designs, new grooves were formed and the entire topography was changed. In addition to change of form produced by the movement of the great mass of ice, other and equally great changes were made by the vast amount of débris deposited by the glacial drift. Of this débris one peculiar formation is found in the rocks in Ohio, western New York and other places, where angular and somewhat rounded stones are imbedded in boulders or striated with rocks. Another is the arrangement of the boulders, showing in many places their removal from their original beds. Sand, clay and gravel were washed by the streams into long lines, so that in the Saint Lawrence basin great sand belts extend across the country for miles and are usually found on the lowlands, at the places that were once edges of ice-coverings. The rocks formed before the Glacial period are in some places covered by glacial deposit for from 100 to 200 feet. On the south side of the Saint Lawrence, at the lower foot-hills of the Adirondacks, may be found rock layers considerably below the surface. Old river channels were dammed, old valleys filled up and new drainage channels formed. The new sub-basins were changed by the glacial deposit and the removal of former divides. The depressions where the Great Lakes are now were formed in part when the southern margin of the glaciers was obstructed north of the divide which extended through New York, Ohio, Indiana, Illinois and toward the Northwest by the ice-block.

The glacier south of the divide discharged its melted waters through streams flowing generally south. The outlets of the glacial streams from the north ice-covering were at first southerly. One was through New York State, near Ithaca and through a portion of the Mohawk and Hudson River valleys to the Atlantic Ocean. Another was south of Lake Michigan along channels into the Mississippi Valley and to the Gulf. Another was from Lake Erie by way of Fort Wayne. At first there were only small but numerous depressions along the south margin of the northern glacier. They grew broader as the ice retreated slowly and gradually merged into each other until the vast lake basins were formed which still preserve proof of their age in the Palæozoic strata which have undergone but little change. Mechanical and chemical agencies and erosion removed rocks and graded the lake beds. The ancient beaches of the early lakes show that at one time the water occupied a greater space than at present. The Iroquois beach, south of Lake Ontario, is quite distinct and shows that the old lake was much larger than the present Ontario. (See NEW YORK). The ancient lake is supposed to have extended north to the glacier. There are shore-line marks south of Lake Erie some distance from the present shore line and from 175 to 220 feet above the lake as it is now. East of Lake Huron are beaches showing a shore line from 25 to 260 feet above the present lake. This record of an ancient large lake is called Algonquin beach. The broad beaches of the ancient lake, of which the present Superior is a part, are in the north shore and extend the whole length. They range from 100 to 600 feet above the surface of the present lake. The soils within the area of the lake-beaches now beyond the lake limits differ from the soils farther inland. They possess many of the characteristics of inundated lands. The beach lands are not alike; near lakes Ontario and Erie are masses of yellow sands, in some parts approaching a gravel and between are large clay deposits. The Lake Superior beaches of the old lake show broad clay coverings, pinkish in color. The combined area of the lakes north and west of Superior which flow into Superior is equal to one of the large lakes. See articles on each of the Great Lakes.

The Rivers.—The main stream of the system was the last to assume its present form, when the ice covering left the region and the waters began the formation of channels extending to the sea. The streams from the divides gradually made their way to the lowest points of the valley and entered the main stream. The main outlet channel, or the river Saint Lawrence, may be said to have its source at Lake Ontario and to extend to below Quebec, to the island of Orleans, where it becomes an estuary. From Lake Ontario until it becomes a tidal stream it is a surface river, of which the waters are remarkably clear. The distance from Lake Ontario to the Gulf is 750 miles. The descent from Lake Ontario to tide water is 230 feet. The Saint Lawrence forms the boundary line between the United States and Canada to long. 74° 15' W., after which its course is wholly in Canada. In width the Saint Lawrence varies from one to three miles, until it broadens into a very wide stream; at Cape Gaspé it is over 50

miles wide. Just after leaving the United States boundary, the river expands and forms what is called Lake Saint Francis and a little above the city of Three Rivers is another expansion called Lake Saint Peter. The chief tributaries are the Ottawa, Saint Maurice, Saguenay, from the north, the Chaudière, Richelieu, Saint Regis, Racquette, Grasse and Oswegatchie from the south. The Richelieu brings to the Saint Lawrence the waters of Lake Champlain. There are numerous beautiful islands in the Saint Lawrence; at the beginning of the main outlet near Lake Ontario, there is a group (about 1,500 in all) called the "Thousand Islands." These islands are famous summer resorts.

The Estuary and Gulf.—The estuary, beginning below Quebec, is 350 miles long, with an extreme width of 35 miles until it flows beyond Anticosti Island, where it widens, as has been mentioned at Cape Gaspé to over 50 miles. The greater part of the Gulf and the estuary are submerged portions of the river valley. A submerged river channel 800 feet wide has been traced to the eastern edge of the continental plain, about 100 miles from the present coast line. The marine shells found in the sand, and clays above Montreal show that at one time the estuary began much farther up the stream than at present. The Gulf of Saint Lawrence has at its mouth in the large island, Newfoundland. It enters the Atlantic by three channels; Cabot Strait, between Newfoundland and Cape Breton, about 65 miles wide; Strait of Belle Isle, between Newfoundland and Labrador; and Gut of Canso, between Nova Scotia and Cape Breton Island. The principal islands in the Gulf are Prince Edward Island, Magdalen Islands and Anticosti.

Navigation.—Ocean steamers of the largest size ascend the Saint Lawrence to Quebec and large vessels go as far as Montreal. Above are several rapids and in Niagara and Saint Mary's River are falls. Steamers coming down the river often pass through the channels between the rocks of the rapids, but ascending the stream they have to go through canals which have been built to overcome the obstructions to navigation. The Welland Canal (q.v.), in Canada, furnishes a means of going around the Niagara Falls. Two canals, one on the American and one on the Canadian side, have been built at Saint Mary's Falls. Navigation on the rivers and lakes is closed in winter. The average number of days the Lachine Canal is opened during the year is 220. See CANALS; for history, see CANADA; UNITED STATES.

SAINT LAWRENCE STATE HOSPITAL, a State institution for the insane situated on the Saint Lawrence River near Ogdensburg, N. Y. It is built on the cottage system and consists of three principal groups and two detached cottages. The central group includes a central administration building and 12 cottages and utility buildings which are detached except for a one-story fireproof corridor to facilitate communication. The cottages are two stories in height and are substantially and beautifully constructed of Potsdam sandstone and limestone. The cottages for men are on the west and those for women on the east of the administration building. The first is called Reception Cottage East or West and it is here

the patients are admitted from home accompanied by a trained nurse sent from the hospital for that purpose. Every effort is made to give this cottage a home-like appearance and to avoid the depressing influence of a large institution. There is a cottage for convalescents, the doors of which are never locked and the patients are permitted to come and go at will. Other cottages are for the disturbed and noisy class, for the quiet and harmless and for working patients. The Infirmary Group and Group Number Three are one-fourth mile from the central group and each accommodates about 400 patients of the chronic classes. The Garden Cottage and Farm Cottage are each one mile from the administration building and are occupied by patients who are employed at gardening and farming. The Saint Lawrence State Hospital is chiefly remarkable as one of the first institutions to abandon the Kirkbride or block system which dominated asylum construction in this country for 50 years and to establish in its stead a simple and more convenient plan. The first medical superintendent was Dr. Peter M. Wise, to whose genius the hospital owes its plan and organization. The hospital was opened for the reception of patients 9 Dec. 1890, but was not completed until 10 years later. The grounds and buildings cover an area of 1,219¼ acres, of which 930¼ acres are under cultivation. There are accommodations for 2,174 patients and 397 employees. The value of real estate including buildings, is \$3,006,750; value of personal property including furniture, etc., \$179,200. The percentage of patients employed in useful work is males 63 per cent, females 50 per cent; the estimated value of farm and garden products raised in a recent year was \$65,920.70; of articles made or manufactured by patients during the year, \$33,941.92. The disbursements amounted to \$361,087.40; miscellaneous receipts, \$399,116.46; the annual expenditure per patient was \$208.

SAINT LAWRENCE UNIVERSITY, Canton, N. Y., was chartered April 1856 for the purpose of "establishing, maintaining and conducting a college for the promotion of general education and to cultivate and advance literature, science and the arts, and to maintain a theological school." Like all other colleges of the State, it is a constituent part of the educational system called the University of the State of New York. It now includes the College of Letters and Science, the Theological School, the Law School, the New York State School of Agriculture. Each department is independent of the others in its faculty and funds and in the instruction and government of its students. The College of Letters and Science offers courses leading to the degrees of bachelor of arts and bachelor of science. From the first, women have been admitted on the same terms as men. The by-laws of the corporation, adopted in 1856, provide that "the College of Letters and Science is and shall remain an unsectarian foundation." Its un denominational character has been consistently maintained. In 1857 the legislature granted to the college \$25,000, of which \$10,000 was to be expended for "books and apparatus" and \$15,000 was to be kept as a permanent fund. The remaining productive funds of the college,

which now exceed a half million dollars, have been the result of private benefactions.

The Theological School, as provided by the by-laws of the corporation, "is and shall remain an institution especially intended and organized for the preparation and training of persons for the ministry of the Universalist Church." It was opened by Ebenezer Fisher, D.D., in April 1858. The first class was graduated in 1861. The degree of Bachelor of Divinity is granted upon completion of certain courses. Under the original charter the corporation was a self-perpetuating body. The Laws of 1868 amended the charter by providing for the election of trustees by the New York State Convention of Universalists. This law remained until 16 March 1910, when it was repealed and the power of the corporation to fill vacancies in its membership was restored.

The establishment of a law school was authorized by chapter 288 of the Laws of 1869, passed 22 April 1869. A law school was maintained in Canton from 1869 until 1872, and two classes were graduated. In 1903 the Brooklyn Law School, which had been incorporated by the Regents of the University of the State of New York, was placed under the control of the Saint Lawrence University. A three-year course leads to the degree of bachelor of laws.

The New York State School of Agriculture was established pursuant to chapter 682 of the Laws of 1906, passed 31 May 1906, and is maintained in the State of New York. It comprises an agricultural division and a domestic science division for women. No degrees are conferred on the graduates of this school as such, but certificates are given on the completion of the prescribed courses. Commodious buildings completely equipped and extensive grounds offer all facilities for the different departments of instruction. The university faculty numbers 80 and the average annual attendance of students is 550.

ST. LEGER, *sānt lēj'ēr*, or *sīl'in-jēr*, **Barry**, British soldier: b. 1737; d. 1789. He served in the siege of Louisburg in 1758, and under Wolfe at Quebec, and checked the flight of the British forces at the Heights of Abraham. He was also the leader of the expedition against Fort Stanwix in the American Revolution. At the close of his career in the British army, in 1784, he was commandant of the royal forces in Canada. His 'Journal of Occurrences in America' was published in London in 1780.

SAINT LOUIS, popular pronunciation *sānt loo-is*, Missouri, city and port of entry, the metropolis of the State. By the Federal census of 1910 it is given fourth place in population among the cities of the country. Its location is on the west bank of the Mississippi River, 20 miles below the mouth of the Missouri River. The site averages 100 feet above all flood waters and 500 feet above the sea.

Topography.—The city directrix is an arbitrary, level set in the wharf. It is 413.52 feet above the mean tide in the Gulf of Mexico, as established by the Mississippi River Commission. A high stage of the river covers the directrix. A low stage is 30 feet below the directrix. There is a recorded difference of 43.35 feet between the highest and lowest stages of the river. On the 27 June 1844 the water

overflowed the directrix 7.58 feet. The lowest stage was on 2 Jan. 1900 when the water dropped 35.77 feet below directrix. Practically all of Saint Louis is well above the highest known stage of the river.

The site of Saint Louis is a succession of gentle ridges and depressions, each ridge toward the west rising higher. Broadway, the 5th street from the river, is 460 feet above the gulf level. At 17th street the altitude is 500 feet. At Grand avenue, the 36th street parallel with the river, the ridge is 540 feet. At the western city limits the elevation is 600 feet. Westward from the city the ridges rise gradually until the plateaus of the Ozarks attain altitudes of 1,000 feet. The area of the city is 61.37 square miles, or 39,276.8 acres. The boundaries are two curved lines, the Mississippi River on the east, an arbitrary limit on the west separating the city from Saint Louis county. The river front from north to south is 19.15 miles. At the widest part, about midway of the two curves, the distance across the city is 6.62 miles. The length of the western boundary is 21.27 miles. The length of the city from the northern point to the extreme southern tapering end is 17 miles by air line. There has been no increase in the city's area since 1875. Of 936 miles of streets 665 are paved. The city has 851 miles of public and district sewers. In topographical and geographical character Saint Louis is of the Ozarks—the foothills. Within the city limits are found the limestone ledges and the caves which are distinguishing features of the Ozarks. For earlier generations the water supply was drawn from fine springs which boiled up from underground watercourses, just as they do now throughout the Ozarks. As the city grew sewage was drained into sinkholes leading down to the underground waters. Epidemics of typhoid and cholera became frequent. Cholera carried off one-tenth of the population in a single year—1849. Sanitary regulations compelled the closing of all wells. Springs were diverted into sewers. About 1875 the river became the exclusive source of water supply, under a scientific system of waterworks described further on in this article.

Climate.—Saint Louis is in lat. 38° 38' and long. 90° 15'. The latitude ensures what may be termed a medium temperature of the United States. The meridian from which central time is fixed is about 12 miles east of Saint Louis. Standard central time for Saint Louis, therefore, is only about one minute faster than mean solar time. The climate is influenced favorably, in some degree, by the two large rivers adjacent. A prevailing breeze up the Mississippi relieves the heat of summer. The nearby waters temper the cold waves of winter. The highest temperature in 1915 was 94°; the lowest—4°. The mean temperature for the year was 56.3°. The rainfall in 1915 was 49.28 inches. The average annual rainfall from 1837 to 1915 inclusive was 40.08. The navigable channel depth of the river from Saint Louis to the mouth of the Ohio during most of the year is seven feet, and from Cairo south, 12 to 14 feet.

Commerce and Industry.—An exclusive privilege to trade in furs prompted the first settlement of Saint Louis in 1764. In 1915 the official report of the trade and commerce of

Saint Louis, made by the Merchants' Exchange, claimed "the greatest raw fur market in the world." The sales of raw furs during that year amounted to \$5,000,000. From 1764 to 1808, the pelt was the chief article of Saint Louis commerce. Against the protests of the fur merchants of Philadelphia and other Atlantic seaboard cities, the furs of the Indian trappers up the Illinois and as far as the Great Lakes found their way to Saint Louis. During a considerable portion of the colonial period the value of the furs handled at Saint Louis averaged \$200,000 annually. Soon after the transfer of the Louisiana Purchase to the United States, fur companies, with headquarters at Saint Louis, were formed. One of these, the American Fur Company, became a strong monopoly. It gradually came into control of the greater part of the fur trade as far west as the Rocky Mountains and as far north as the British possessions, even entering into competition with the Hudson's Bay Company. The American Fur Company had its New York connection through John Jacob Astor. Among other fur companies formed by Saint Louisans were the Missouri and the Rocky Mountain. Saint Louis was the outfitting point for the expeditions and the receiving place for the packs of pelts. In 1820 the Saint Louis trade in furs had reached \$600,000. Steam navigation above Saint Louis had just begun. The average annual value of the fur trade was estimated conservatively at not more than \$300,000. There were wide variations in the annual outputs. The value of the furs received in 1852 was \$1,000,000, buffalo robes constituting one-tenth of the product. After 1860 the Saint Louis fur trade decreased in volume. The Franco-Prussian War in 1871 destroyed one of the principal markets for Saint Louis furs. The trade was an inconsiderable part of the commerce of Saint Louis until about 1890 when a marked revival set in. The development has continued. In 1913 it was officially reported that "Saint Louis is drawing furs from every State in the United States, every province in Canada, as well as Alaska and Mexico."

From 1764 to 1850 the fur traffic overshadowed other business to such an extent that it dwarfed enterprise in varied directions. On the profits in pelts were founded many family fortunes. But the decade from 1850 to 1860 brought important changes, both commercially and industrially, to Saint Louis. Writers pointed out forcibly that this concentration of effort in a single direction was not for the best interests of the city; that development of manufacturing had been retarded. The decade was hardly begun when Saint Louis, having depended up to that time entirely upon water routes, began to plan and build the first railroad lines eastward and westward. The first train west from Saint Louis was run in 1854. In four years, with the population not quite 100,000, Saint Louis contributed \$6,400,000 toward the construction of four railroads, one on the Illinois side of the Mississippi, three in Missouri, starting from the city. At the same time local capital, some of it derived from the fur trade, was applied toward the development of the iron industry. Furnaces were established along the river front. Iron ore, of high grade, was brought from two immense bodies of phenomenal character—Iron Moun-

tain and Pilot Knob. During a number of years this output of ore was valued at \$1,000,000 annually. Bituminous coal, easily worked and of inexhaustible quantity, was brought from mines a few miles distant on the Illinois side of the river. Pig iron production 40 years ago reached such proportions that Saint Louis confidently expected to become the centre of that industry for the whole country. "The City of the Iron Crown" was the title claimed. But introduction of new processes, the development of lower grade ores of the Lake Superior region and of the Southern States, together with increasing cost of mining at Iron Mountain and Pilot Knob, caused a gradual abandonment of smelting. The manufacture of finished steel and iron products took the place of the pig-iron industry. In 1915 the Saint Louis district was using 350,000 tons of pig iron annually. Of this amount 25,000 tons was of local smelting. Within the year 1916 was organized the Mississippi Valley Iron Company, with a capital of \$5,000,000, to increase the local production of pig iron. The many steel and iron industries of Saint Louis have invested \$30,000,000. The annual output of these industries is \$80,000,000. This includes structural iron, steel castings, foundry and machine-shop products, boilers, wire goods, tin enameled and galvanized iron, cutlery, tools and agricultural implements, stoves, ranges and furnaces.

As the production of iron ore declined, two other ores came into increasing prominence at Saint Louis about 1880. These were lead and zinc. Soon after the close of the Civil War, the government experts predicted coming exhaustion of the Missouri lead deposits. They believed that it was a question of a few years until the galena, which was being found in pocket and nugget formations, at comparatively shallow depths, would fail. Then came the discovery of vast bodies of disseminated lead ore,—lead disseminated in the limestone. About the same time, the zinc ore, which the lead miners called "jack" and which they had excavated in their search for lead and thrown away on the dumps as of no value, came into demand. Missouri mines send to Saint Louis yearly, under normal conditions, 4,000,000 pigs of lead and 4,500,000 slabs of zinc and spelter. To 1916 the value of these iron, lead and zinc ores was estimated at \$500,000,000. The present value of the lead industry to Saint Louis, including products from the raw material, not taking into account abnormal demands of the European War, is \$10,000,000 a year. Among the industries allied with the iron, steel, lead and zinc are railroad and street cars, \$18,000,000; plumbers' and steam fitters' supplies, \$7,000,000; electrical manufactures, \$18,000,000; paint, paint oils and white lead, \$14,500,000.

The early experience with the fur trade and with smelting furnaces taught local capital the policy of diversity in industry and commerce. The Saint Louis district, which includes both sides of the river and extends a few miles beyond the city limits, by the latest official reports, has 3,500 industries, with \$407,000,000 capital employed. These industries employ 150,000 people and utilize \$203,480,000 raw material. The manufactured products are \$550,000,000. By the most recent summary of the Business Men's League, which is the central commercial and civic organization of the city, Saint Louis

manufactures \$65,000,000 worth of shoes annually; is the largest manufacturing centre of tobacco in the world; holds first place in the output of American-made chemicals; is the largest lumber market in America; is the largest coffee distributing point in the United States; has the largest horse and mule market in the world.

The introduction of power from the hydro-electric plant at the Keokuk Dam is a recent acquisition. In 1916 Saint Louis utilized 60,000 horse power from this source. Wires from the dam are carried on steel towers. They convey 100,000 volts at low amperage. At the city limits, this current is stepped down to lower voltage and higher amperage.

The Saint Louis Merchants' Exchange reported these sales of leading commodities in 1915:

Dry goods.....	\$75,000,000	Vehicles.....	\$20,000,000
Groceries.....	72,000,000	Clothing.....	19,800,000
Boots and shoes	65,000,000	Electrical appa-	
Tobacco.....	55,000,000	ratus.....	18,000,000
Hardware.....	50,000,000	Cars.....	18,000,000
Lumber.....	40,000,000	Soap.....	16,000,000
Drugs.....	25,000,000	Foundry products	16,000,000
Woodenware.....	20,000,000		

Saint Louis jobbing houses employ 10,000 people in stores and factories, and send out 1,000 traveling salesmen. The shoes manufactured in a year number 26,500,000, one for every fourth person in the United States. The lumber interests in Saint Louis represents \$120,000,000 of capital, own 350 mills located in a dozen States and employ 117,000 people.

Reports to the comptroller of the currency at the close of business 12 Sept. 1916 showed that the banks and trust companies of Saint Louis had deposits of \$351,552,035, and total resources of \$441,689,464. These returns gave a gain of \$50,000,000 in deposits, compared with September 1915. Loans and discounts were \$249,353,650, and cash and exchange, \$110,205,627. Bank clearings for 1915 were \$4,153,520,336, an increase of 6.4 per cent.

The Universal Exposition of 1904, held by the Louisiana Purchase Exposition Company to celebrate the centennial of the acquisition of Louisiana Territory, had an attendance of 19,594,855, of which 12,854,616 was paid. The exposition was financed with \$5,000,000 in subscriptions by individuals and corporations, with \$5,000,000 bonds voted by the city, and with \$5,000,000 aid voted by Congress. Subsequently Congress voted a loan of \$4,600,000 which was repaid in exact accordance with the terms of the act. The exposition opened 30 April and closed 1 December. The international jury awarded to exhibitors 45,000 grand prizes, gold, silver and bronze medals. The total revenue of the exposition was \$12,185,497, of which \$6,243,358 was from admissions, \$2,879,843 from concessions, \$627,473 from the intramural railroad.

A City of Brick Homes.—Saint Louis is a home-made city. The first settlers built their "houses of posts" with trees cut on the sites. They placed the logs on end instead of horizontally after the manner of "the Bostons" as they called the settlers east of the Alleghanies. They set the ends of these posts on the flat limestone quarried nearby and they chinked the cracks with the strong clay which was everywhere. As the fur traders prospered, they built houses of limestone from the local quar-

ries. The Saint Louisan of the latest decade does not go beyond the city limits for most of the building material. The local quarries are still worked. The brick in enormous quantities is manufactured here. The sand is pumped from the river bed. Lime and cement and sewer pipe and terra cotta,—all are local products of the value of many millions of dollars annually. Before the development of the more cheaply worked mines a few miles distant on the Illinois side, coal was taken from the seams underlying Saint Louis. When U. S. Grant sold cordwood in Saint Louis at \$4 a cord, he trimmed the branches with forks and sold these "props" as they were called to the Saint Louis coal mines at \$5 a load. This abundance and cheapness of local building material has encouraged two distinguishing characteristics of Saint Louis. This is a city of brick. Even the elaborate and more costly mansions, with few exceptions, are of this material. Saint Louis is a city of homes. In 1910 the census gave 105,650 separate dwellings for 155,563 families, an extraordinary proportion.

Transportation.—The first bridge at Saint Louis was completed in 1874. Crossing of the Mississippi had been by ferriage for 110 years. The bridge was constructed according to plans of James B. Eads, many of the engineering features being original with him. The cost, including the tunnel at the Saint Louis end, was over \$10,000,000. To minimize interference with navigation, a height of 55 feet above high water was required. This made necessary a long and an expensive approach over the lowland on the Illinois side. The length of the bridge and tunnel is 6,220 feet. The tunnel passes under the retail business district and opens on the Mill Creek Valley, a wide depression extending westward from the river to the city limits. About one-third of the city is south of the Mill Creek Valley. When Saint Louis was founded, a small river, fed by many large limestone springs, flowed down this valley. The first settlers dammed the river where the valley narrowed and built a mill where Seventh street is to-day. The dam created a lake half a mile wide and three miles long, known for several generations as Chouteau's Pond. This body of water, with irregular and wooded banks, was preserved until about 1850 when drainage from the growing city made it insanitary. Previous to that time it was a place of general resort for recreation, summer and winter. Travelers described the pond as one of the attractions of Saint Louis. After the pond was drained, an enormous sewer was built to take care of the sewage and the storm water of the central part of the city. When the Eads bridge and tunnel were opened the bed of the old pond became the logical location of terminals needed to accommodate the railroads which until then had maintained terminals on the Illinois side of the river. The railroads proposed that the city acquire land, construct and own terminals and grant use of them to incoming traffic on rental basis. A citizens' organization was formed and engineers employed. These engineers, with the engineers of roads on the Missouri side of the river, prepared what at that time was an elaborate plan for municipal-owned terminals, including depots, freight and passenger, yards and connections with all west side roads, via-

SAINT LOUIS

W. C. Persons. Photo.

1 Portland Place, one of the exclusive residential streets of the city. Saint Louis is noted for its beautiful homes. It is estimated that 37 per cent of the inhabitants of the city own their own homes.

2 Kingshighway, the street of churches. The four pretentious buildings are the Tuscan Building, A. F. & A. M.; the Saint John's Methodist Church (South); Temple Israel; and the Second Baptist Church.

SAINT LOUIS

1 "Olive Street Canyon," Olive street, looking west from Fourth street. In the right background the Railway Exchange Building, the largest office building in point of area in the world.

2 Olive street, the principal retail street of the city. The scene is looking west from Eighth street. In the left foreground can be seen a portion of the new Alcade building.

ducts and loading tracks. The entire cost of ground, improvements and equipment was estimated by the engineers at between \$5,000,000 and \$6,000,000. The property and rights which could have been acquired by the city 42 years ago at less than \$6,000,000 are to-day valued at \$100,000,000. The municipal government declined to accept the plan of the engineers. This refusal compelled the railroads on both sides of the river to organize a terminal association, buy ground and provide facilities to take care of traffic. No one of the 26 railroad systems passes through Saint Louis. The Wabash and the Missouri Pacific have lines on both sides of the river but Saint Louis is the initial point with all. The rails of the 26 trunk lines cover 64,071 miles, not including controlled systems. The terminal association has expanded its activities until now it operates on both sides of the river. It uses the Eads bridge and tunnel and a second bridge, the Merchants. During the year ending 30 June 1916, the terminal handled 1,215,836 freight cars across the river, which was 100,000 more than in the previous year. In its service the terminal employs 100-ton locomotives which haul 100 cars. It employs 4,457 people. It has a belt line and 225 switches serving Saint Louis industries. During last year it interchanged with 95 connections 3,517,860 freight cars.

All of the steam railroads use the same passenger terminal. The union station was opened in 1894. At that time it was said to be the largest railroad passenger terminal in the United States. The facilities were enlarged in 1904. The train shed measures 606 by 810 feet. It has 32 tracks, aggregating six and five-tenths miles. Mails and baggage are handled through an extensive subway system underneath the tracks. The main subway is 100 feet wide and 600 feet long. There are six connecting subways leading to adjacent buildings. The station is of the dead end type. All trains back in and head out. They are under the control of an interlocking system said to be the largest in the world. Three towers are equipped with 344 levers. There are 1,827 possible routes to get in and out of the train shed governed by tower No. 1. The average number of passenger trains daily in 1916 was 287. The average number of passenger coaches daily was 1,534. Most of the trains arrive and depart between 7 A.M. and 9 A.M. and between 6 P.M. and 10 P.M. The passenger coaches handled during 1916 numbered 561,410. The average number of tickets sold daily, not including exchange tickets, was 3,175.

Fifteen railroads constitute the terminal association. They are the guarantors of the bonds and other obligations. All other common carriers are given the use of all of the facilities on exactly the same terms and conditions as prevail for the 15 lines. Decline of river traffic was steady after the development of the railroads. In 1915 the inbound traffic by river amounted to only 88,870 tons out of a total of 30,684,935 tons received, and 53,181 tons outbound out of 22,252,181 tons shipped. Until 1916 the river traffic continued to use the old sloped levee, the gangplanks and the manual labor of the negro roustabout. In 1916 the city, in the effort to revive the river traffic, began the building of modern terminals with quay walls,

crane elevators, warehouses and railroad connections, the first unit costing \$250,000.

The street car system is operated by one corporation, the United Railways Company. It consists of 344 miles of track within the city limits. The fare is five cents for adults and half fare for children. Universal transfers are given. From any point on any line the passenger is sent to any point on any other line by the most direct route even though it requires two changes. During 1915 the number of passengers carried was 227,863,250 on full fare and 4,908,140 on half fare. The transfers used were 124,043,205. The number of cars in daily use was 1,250. Besides paying regular taxes on property and franchises the company is required to pay to the city one mill for every full fare passenger. This yields the city about \$250,000 yearly. The company operates under a number of franchises of different lines, the extension of all of these franchises to 1948 under a blanket ordinance being in dispute with the city. The Illinois Traction system enters the city over its own bridge and operates 4.74 miles of track to its terminus at 12th street and Lucas avenue. For the purpose of encouraging traffic to enter the city without paying the charges of the terminal association, the city has build a bridge across the river at the foot of Chouteau avenue. The expenditures upon this bridge, which is without terminals as yet, have been \$7,000,000.

Cupples Station Blocks.—Where the tunnel under the central business district opens upon Mill Creek Valley,—the traffic aorta of Saint Louis,—are located the Cupples Station Blocks. They occupy 10 acres of ground. Merchandise of almost every character is received at and shipped from the back doors of these blocks. It goes to railroad points in all parts of the United States. Cupples Station does not merely save drayage between car and store. It conserves labor and economizes time in the business of the largest shippers of Saint Louis. It saves the ordinary wear and tear of merchandise. Hardware, woodenware and groceries are the heaviest lines of goods handled. The goods which pass through Cupples Station in a year are valued at \$40,000,000. Two firms, the Simmons Hardware Company and the Cupples Woodenware Company, do \$25,000,000 of this business. The amount of merchandise handled daily averages 1,000 tons. A network of switches and sidetracks reaches all parts of the station, entering alongside back doors and into basements. Sixty cars find room on these tracks at one time, and under cover, ready for unloading or loading. A single power plant for all of these blocks supplies light, heat and power, electric or hydraulic. The platforms have 100,000 square feet of space. They are of two main levels, one at the car doors and one a story higher. These levels are connected by nine powerful elevators, operated by the employees of the station. The 30 tenants of the 20 blocks have 50 elevators reaching their various floors. Freight is moved between cars and stores on 5,000 trucks each with capacity for 5,000 pounds and especially designed for easy movement. The trucks represent an investment of \$100,000. Traffic between cars and stores is conducted by a trained force which is part of the station service rendered the tenants. During the night, cars having freight billed to

Cupples Station are placed upon the tracks along the platforms. At seven o'clock in the morning 100 station men open the cars, place the goods on trucks and wheel the trucks to the doors of the tenants. In two hours the cars are empty and the contents have been delivered to the several blocks. After nine o'clock the trucks with outbound goods begin to arrive on the upper platform. There the station employees receive the goods and the bills of lading are signed. The shipments are assorted according to schedules which show the order in which cars must be loaded for the several railroads in order to secure the most expeditious movement to destination. A most important part of the service rendered is this assortment of shipments, the loading of the cars and the delivery of the cars to the roads. The trained force and the system reduce to a minimum the time of delivery to the consignee. They afford the shipper great advantage over the usual methods of sending goods by dray to the freight depots. Cupples Station represents in Saint Louis the efficiency of the Bush terminals in New York City and of the 40 warehouses in Pittsburgh.

A New Post-Office Policy.—The new Saint Louis post office, built at a cost of \$1,250,000, was completed in 1912. At that time it was said to be the largest building in the world devoted exclusively to the handling of mail matter. It was the first large post office constructed by the United States under an entirely new policy as to location and architecture. The building is substantial in appearance; it is not ornate and is only impressive in size. It is located a considerable distance from the business centre, is adjacent to the railroad terminals and separated from union station by a street. A large subway connects the post office with union station, passing under the 32 tracks. The tunnel is so located as to bring the mail trucks near the mail cars of the train of average length. Inbound mail is loaded on the trucks which are lowered into the tunnel and wheeled into the basement of the post-office. Outbound mail is collected from substations in all parts of the city by auto trucks, hauled to the post-office and delivered on the mail cars by the tunnel route. The new building abounds in automatic traveling devices by which mail is carried from one part of the building to another. Clerks remain at their stations, saving 90 per cent of the time spent in walking about under the old system.

Education.—The public school system is maintained by a tax of 60 cents on the \$100 valuation as shown by the municipal assessment, by an apportionment from the State school fund and by income from property owned by the board of education. Income from all sources for the year ending 30 June 1915 was \$4,709,494.43. The income is increasing at the rate of about \$100,000 yearly. By the State constitution the school tax rate is limited to six mills on the dollar. The board of education is composed of 12 members who are elected at large by the entire city, four members retiring every two years. The body is independent of the municipal government, having a separate charter and being authorized to levy taxes within the limit and to expend the revenue for school purposes. To preserve a non-partisan or bi-

partisan character, the two principal parties have for several years divided equally the nominations for the board. There are six high schools, one of which is for negroes. The enrolment for 1916 was 8,253 in high schools and 80,474 in elementary schools. A notable development has been the increase in high school attendance. In 1900 the high school enrolment was 25 to every 1,000 pupils in the schools. In 1916 it was 86 to every 1,000. Another notable fact is that while the number of children of school age increased from 1900 to 1915 only 9 per cent, the attendance increased 37 per cent. Among the departments of school work added in recent years are a teachers' college for training, special schools for individual instruction of defectives, open air schools for children with tuberculosis tendency, extra hours in high schools, an educational museum, a department to enforce attendance, a department of hygiene, summer term schools. The salary schedule has been increased \$550,000 annually. The total assets of the board of education amounted to \$17,848,198 in 1915. They include 234 school buildings, several of them costing \$500,000 each. The public school buildings are used for evening meetings of civic bodies, 1,320 of such meetings having been held in the schoolhouses the past year. The announced policy of the board of education is to add new features of school work as rapidly as funds will permit. Among these features are hand work for fourth, fifth and sixth grades; physical training in out-of-program hours; increase in number and scope of evening schools; increase and scope of summer term schools; more shop and laboratory opportunities in high schools; special classes for normal but retarded children; survey of industrial conditions and vocational guidance.

Saint Louis schoolhouses are now built fireproof and with every modern convenience. With each new school provision is made for much more playground space than formerly. Teachers are appointed under a merit system. They maintain a pedagogical society and a teachers' benevolent annuity association, both of large membership. Women after 25 and men after 30 years of teaching may retire and receive an annuity. The annual dues are 1 per cent of the salary.

Higher Education.—Washington University, with a campus of 113 acres adjacent to Forest Park, with 12 granite buildings arranged in quadrangles, received its name from the fact that the charter for it was signed by the governor of Missouri on 22 February, Washington's birthday. The year was 1853. For a short time the institution was called Eliot Seminary, Rev. Dr. William Greenleaf Eliot having been foremost in promoting the organization. The institution has never received national, State or city aid further than that the charter exempted its property from taxation. The active endowment at present is \$11,000,000, with about \$5,000,000 more, the income from which will come later. All of this endowment was derived from the gifts of individuals and business corporations. It is receiving additions in considerable sums and frequently. The charter provided that the institution management must be non-sectarian and non-political. No professor or tutor is asked his religion or politics be-

fore his appointment. Beginning with the college in 1857, the trustees added the law school in 1867, the engineering department in 1870, the school of fine arts in 1879, the school of botany in 1885. In 1915 new buildings for the medical department were completed at a cost of over \$1,000,000. This department is conducted in close relationship with Barnes Hospital, buildings, equipment and endowment of which represent more than \$1,000,000. The medical school limits its students to 250 and teaches largely through research. The buildings and endowment of the medical school will be an investment of \$5,000,000. Four citizens of Saint Louis pledged \$500,000 each. The foremost givers to Washington University have been Robert S. Brookings, now president of the board of trustees, and the late Samuel Cupples. Mr. Brookings, the active head of the Cupples Woodenware Company, planned and developed the great transportation asset of Saint Louis known as Cupples Station. Mr. Brookings and Mr. Cupples gave to Washington University this property when it had developed a valuation of several millions of dollars. Washington University encourages the most practical forms of education. It was the pioneer in manual training under the late Dr. Calvin M. Woodward and carried on a manual training school until this kind of instruction was made a feature of the public school system. The university has recently established a school of finance and commerce. It devotes much attention to advanced and graduate courses. Secondary schools of the university are Mary Institute for girls and Smith Academy for boys, each occupying its own building a mile or more from the university.

Saint Louis University, conducted by the Jesuits, occupies a large group of buildings on Grand avenue. It has a library of 40,000 volumes, many of them rare and old, including the Christian Fathers, in Latin; first editions of Luther; the Bible in 21 languages; "Records of the English Government," beginning with "Doomsday Book" and ending with George IV. The university, in addition to classical and scientific departments, has law and medical schools and a school of finance and commerce. The will of the late James Campbell left the entire estate of \$10,000,000 to Saint Louis University for the promotion of medical education, subject only to life income interests of the widow and one daughter. The Ranken Mechanical Trades School, to prepare youth for the skilled trades, is a recent addition to Saint Louis educational institutions. It was founded and endowed by James Ranken, Jr., a bachelor, who left an estate of \$1,000,000 for this purpose. The College of the Christian Brothers and Forest Park College for girls are largely attended. Saint Louis has several independent medical schools, a college of pharmacy and numerous convent schools and seminaries. About 30,000 pupils attend parochial schools.

Institutions.—A central structure costing \$1,500,000, six branches costing \$100,000 each, 60 delivery stations, with collections sent out to schools, clubs and various associations, keep the 400,000 books of the Saint Louis Public Library in circulation. Mr. Carnegie contributed \$1,000,000. The city gave as much more and voted an annual tax for support. The new central library building is a fine study in archi-

itecture. It has an impressive marble entrance hall, a great marble delivery chamber, which is considered one of the most beautiful rooms in the country, an art room with a ceiling inspired by a Florentine church. The ceiling of the long reading-room was copied from the Laurentian Library in Florence. The reference and open-shelf rooms have ceilings of painted beams, after the style of old French chateaux. The City Art Museum is said to be the only municipal art museum maintained entirely from public funds. It occupies a fireproof building erected at a cost approximately of \$1,000,000 by the Louisiana Purchase Exposition Company. The central nave into which the main entrance opens contains a collection of American sculpture said to be the largest and most representative in existence. The exposition company devoted \$450,000 to the sculpture for the World's Fair, distributing the commissions among 150 American sculptors. At the close of the fair the best of the works were installed permanently in the museum. 'The Puritan' by St. Gaudens, 'The Sculptor' by French, 'Lincoln' by Weinmann, are in the collection. Four galleries are filled with casts from the antique. Other collections are widely varied, including porcelains by Doat, bronze reproductions from Naples, Greek vases of about 470 B.C. The large picture galleries are occupied by paintings. Two long galleries are given to prints. The annual tax yields a sufficient sum to maintain the museum and to permit of notable acquisitions yearly. The estimated value of the collections is \$1,500,000. The attendance is 200,000 annually. Jefferson Memorial, built by the Louisiana Purchase Exposition Company at a cost of \$493,000, and dedicated 30 April 1913, is in Forest Park, marking what was the main entrance to the World's Fair of 1904. In the rotunda are Bitter's heroic marble statue of Thomas Jefferson and Bitter's lifesize bronze group of the 'Signing of the Treaty,' by Marbois, Livingston and Monroe, for the acquisition of Louisiana Territory by the United States. The wings of the memorial are occupied by the Missouri Historical Society and by the Louisiana Purchase Historical Association. The collections embrace 30,000 archaeological specimens, an historical library of 25,000 volumes, continuous newspaper files of more than a century, battle flags, genealogical records, a municipal exhibit, literature of the World's Fair and a great number of historical manuscripts relating to the 13 States created out of the Louisiana Territory. The rotunda is 60 feet in diameter, fronted with six massive columns. The building is 330 feet in length. The collections are open to the public. The institution is maintained by annual dues of members and by an endowment.

Mercantile Library, sustained by dues of members and by endowment, has 150,000 volumes. It is especially rich in historical literature pertaining to the West. It occupies a building of its own in the business centre. A large reading-room is supplied with 600 periodicals. The halls contain many paintings and statues.

Churches, Benevolent Institutions.—A distinguishing feature of the population is the large number of the descendants of the early French settlers. Families of 10 to 15 children were not unusual in the colonial periods. A genealogical chart brought down to recent date gave the names of more than 900 descendants of Mme.

Marie Thérèse Chouteau, the first woman resident of Saint Louis, coming in the spring of 1764. Descendants of Madame Chouteau in the present generation married descendants of six nationalities. The devotion of the original Saint Louis stock to the Catholic Church has given Saint Louis a strong religious character. There are 380 churches, of which 80 are Catholic and the rest of almost all Christian denominations. Churches and other buildings devoted to religious purposes aggregate in value \$10,000,000, and include some fine structures, notable among which are the old Walnut Street Cathedral, dating from the French occupation of Saint Louis, and the Gothic interior of the church of Saints Peter and Paul, founded in 1848, the oldest German Catholic church in the city. For the maintenance of churches the people contribute \$1,000,000 annually, and nearly as much to benevolent institutions.

Botanical Garden and Parks.—Henry Shaw, an Englishman and a bachelor, came to Saint Louis in 1819 and opened a hardware store. In 30 years he accumulated a fortune. He retired from business and established in 1858 what is now the most complete botanical garden in America. The tract, farm land when Mr. Shaw bought it, is now within a well-built section of the city. Mr. Shaw traveled extensively before selecting the location for the "Missouri Botanical Garden," as he named it. He chose Saint Louis because, he said, climate and soil here encouraged the greatest variety of plant life. In the 120 acres of "Shaw's Garden," as it is popularly known, are assembled 15,000 varieties of plants from all parts of the world. Two new conservatories and a new palm house have been added recently to the already large collection of buildings. Orchids, one of the finest collections in existence, more than 1,000 varieties, are displayed in a special house. Another building is devoted to insectivorous plants. A medicinal garden, the herbaceous tract, the North American tract, the arboretum, the water garden, a collection of 1,000 varieties of cacti, a rose garden with 500 selected varieties—these are some of the divisions of the garden. Monthly displays of flowering plants are made in two large conservatories. The garden is open to the public. On Saturdays visitors in groups are personally conducted. Ownership is vested in a board of trustees which administers income-bearing property valued at \$4,000,000. The net income maintains the garden and also the Henry Shaw School of Botany, a department of Washington University. The botanical library contains 18,550 volumes, 22,608 pamphlets, 66 manuscript volumes. In the herbarium are 400,000 sheets of specimens.

In addition to the garden, Henry Shaw gave Tower Grove Park of 266 acres adjacent and highly improved, the condition being that the city appropriate annually \$25,000 toward the maintenance. The park contains three fine bronze statues given by Mr. Shaw—Shakespeare, Humboldt and Columbus, executed by Mueller of Munich.

Forest is the largest of 53 parks, playgrounds and other reservations for recreation purposes. It contains 1,380 acres. The entire park acreage is 2,766. Installation of golf courses, tennis courts, soccer fields and swim-

ming pools is of comparatively recent date, but is on a scale befitting the population. Fairground, a park of 128 acres, has the largest open-air swimming pool in the country, holding 4,000,000 gallons of water. Natural amphitheatres in Forest Park have been used successfully for open-air dramatic performances. The daily attendance upon the Pageant and Masque in 1914 was 100,000. In 1916 'As You Like It' was given to audiences of 10,000. The statuary in the parks includes Saint Louis (equestrian), Laclede, Washington, Benton, Blair, Bates, Grant and Sigel. Jefferson Barracks, at the southern limits of Saint Louis, is one of the largest military reservations in the country. It is one of the four principal recruiting stations. The buildings represent an expenditure of \$1,000,000. A part of the reservation is used for a national cemetery, with 12,000 headstones.

Municipal Government.—The constitution of Missouri, adopted in 1875, conferred upon the city of Saint Louis the power to frame its own charter and at the same time to separate from Saint Louis County. Accordingly a new charter was adopted for the city in 1876. The scheme of a separation was carried. The effect was to establish city boundaries not subject to the usual method of change as the city population grew. The boundaries of the city remain as they were determined by the charter 40 years ago. Several municipalities—Maplewood, Webster, Kirkwood, Clayton, University City—have been formed adjacent to the western limits of Saint Louis. They cannot be brought into the city without their consent and the consent of Saint Louis County. Movements to extend the limits of the city to include thickly-settled portions of the county have not progressed satisfactorily. The effect upon the city's growth in population has already become quite apparent. Street car service, telephone service and some other utilities have crossed the county line without increase of rates. Many thousands of people do business in Saint Louis but live beyond the city limits and are not included in the city's population. The charter adopted in 1876 was continued, with a few amendments, until 1914, when, 30 June, a new charter on modern lines, making radical changes in the forms of municipal government was adopted. The number of elective offices was reduced materially. The mayor now appoints the assessor, treasurer, commissioner of supplies, register, city counsellor, marshal, City Court judges and clerks. For the bicameral legislative department has been substituted a board of aldermen, consisting of a president and 28 members, one for each ward. These aldermen must be residents of their respective wards but are elected by the general vote of the city until such time as the constitution of the State shall permit each ward to elect its alderman. The board of aldermen performs legislative duties only. Such administrative measures as were formerly within the scope of the municipal assembly are now at the disposition of a board of public service. The board of public service, likewise appointed by the mayor at the beginning of his four years' term, is composed of a president and four directors of departments. The departments are public utilities, streets and sewers, public welfare and public safety. A merit system requires the examination of can-

didates for appointive positions of subordinate classes. An efficiency board, created by the new charter, conducts the examinations and maintains eligible lists from which the three highest candidates are certified to the appointing officers as vacancies are to be filled. The budget system has been introduced under the charter. A board of apportionment, composed of the mayor, the comptroller and the president of the board of aldermen, controls expenditures. The board of aldermen can reduce or cut out items in appropriation bills but cannot increase or insert. The charter confers the right of municipal ownership of public utilities of any kind. This was forbidden under the old charter.

Initiative, referendum and recall are provided. Five per cent of the registered voters for a general election and 7 per cent for a special election have the power to submit to vote the initiated ordinances. Two per cent of the registered voters can prevent an ordinance, except an emergency measure, from going into effect at the 30-days' limit. Forty days more are allowed for the petition by 5 per cent, additional to the 2 per cent, of the registered voters, to compel submission of the suspended ordinance at the next general election; or 10 per cent of the registered voters can compel the submission of the referendum to a special election. After the filing of the petition by 5 per cent or 10 per cent of the voters the board of aldermen is given opportunity to reconsider and repeal the ordinance. If this is not done the ordinance goes to referendum vote.

Any elective officer may be recalled. The petition for the submission of the recall to the voters must be signed by 20 per cent of the registered voters, and these signers must include 20 per cent of the registered voters in each of at least two-thirds of the 28 wards. No recall petition can be filed within the first six months or the last six months of an official term. A successor cannot be elected at the same election that passes upon a recall.

The charter established a complaint board, whose duty it is to investigate the complaint of any citizen about the conduct of any branch of the municipal government or of any public service corporation. The powers conferred by the charter are along modern lines and are extensive, restricted only by the State constitution. The State retains control of three departments: the board of police commissioners, the excise commissioner and the election commissioner, all of whom are appointed by the governor.

Municipal Finances.—The municipal revenue for the fiscal year of 1915, not including receipts from water rates and interest and sinking fund taxation, was \$11,073,142.80. The revenue has doubled in 15 years. The tax rate for State, city and schools in 1916 was \$2.35 on the \$100 assessed valuation. The division of the rate was .18 for the State; .60 for the schools; .04 for the public library; .02 for the city art museum; \$1.15 for municipal purposes; .36 for interest and sinking fund. The assessed valuation by the city for the taxes of 1916 was: Real estate, \$496,344,000; personalty, \$98,048,520. The State board of equalization, which assesses railroad, bridge, telegraph, express and street railway property, added \$36,069,769, making the total assessment for Saint Louis \$630,452,289. The basis of assessment is two-thirds of actual valuation. The annual increase in the assess-

ment is about \$20,000,000. The bonded debt in 1916 was \$23,443,000, with \$2,791,276 in the sinking fund. This was a smaller debt than the city had 40 years ago. New issues of bonds have been put out from time to time but the debt has been reduced more than it has been increased, notwithstanding growth of population. The present debt of Saint Louis is \$16,000,000 below the limit of indebtedness permitted by the State constitution.

Waterworks.—The valuation placed upon the waterworks of Saint Louis is \$31,000,000, about two-thirds for the plant and one-third for the distributing system. The water is conducted from two intake towers in the channel of the Mississippi, at the extreme northern limits of the city, and a few miles below the mouth of the Missouri River. Three rivers supply the water,—the Missouri, the Mississippi and the Illinois, the proportions varying widely as the stages of the three rivers change. The waters of the Missouri and the Mississippi are of such different character that they do not unite in the few miles between the mouth of the Missouri and the Chain of Rocks, the location of the waterworks, but flow side by side. The intake tower nearest the Missouri shore receives almost exclusively the Missouri River flow. The city's supply is drawn largely from this tower, except when low stages of the river make it necessary to depend upon the more distant intake which is in a deeper part of the channel.

Decided preference is given to the Missouri River water for two reasons: The Missouri water, although more heavily loaded with silt and less attractive in appearance, yields more readily to the purifying treatment. More important is the fact that there are no large cities on the Missouri for 250 miles above its mouth and there is less contamination from sewage than in the water from the upper Mississippi and the Illinois.

The water let in through the gates of the intake towers flows by gravity through tunnels 60 feet below the ground to the pumps. It is received in wells from which it is lifted by the pumps to settling reservoirs. Between the tunnels and the reservoirs the water during its agitation from the pumps receives the treatment with lime and sulphate of iron, both in liquid form. The liquefaction takes place in the coagulant house. The two streams from the coagulant house are thoroughly mixed with the water. The chemical result is sedimentation so rapid and comprehensive that it cannot be appreciated unless seen in operation. By the time the water has passed through the grit chamber and into the first reservoir coagulation has taken place to such a degree that more than 90 per cent of the mud and solid matter is carried to the bottom.

The city tried settling reservoirs for many years with only partial relief from the muddy water. Filters were in quite general use in Saint Louis homes. The solution of the water purification problem was discovered in March 1904, after long experimentation. At first the methods of applying the lime and iron were crude but they produced such gratifying results that the city developed the process with liberal expenditures now amounting to several millions of dollars. In 1915 the process was further improved by the installation of a mixing cham-

ber and grit chamber before the water reaches the first reservoir. In this grit chamber 29 per cent of the solids drop to the bottom.

The iron and lime are reduced to liquid forms with elaborate automatic machinery in the coagulant house. The proportions of lime and iron vary from hour to hour, as determined by laboratory tests of the "raw" water. The application of the streams of milk of lime and of iron was tried out at several stages of the passage from the intakes to the reservoir before the best results were found. The mud taken out of the water used by the city in 1915 amounted to 358,000 tons, as stated by the water commissioner. In the purification process of that year 13,660 tons of lime and 6,770 tons of sulphate of iron were used. But the cost of purification is insignificant when the benefits are considered. The cost of purification in 1915 was only \$4.56 per 1,000,000 gallons, or \$424 per day for the entire supply. In earlier years there was some complaint of "causticity," as the result of the use of lime. It is claimed officially now that the coagulation not only takes out of the water all of the lime artificially added for purification but reduces the amount of lime held in solution by the "raw" water.

In 1915 a filter plant, said to be the largest in the world, was added at a cost of \$1,357,000. This plant receives the water after it has undergone the purifying process with the lime and iron. In the passage of the water from the reservoirs through the filter to the supply conduit of the city, chlorine and sulphate of alumina are added. The chlorine is introduced just before filtration and the alumina just after. In the first year's operation of the filter plant the 29,823,000,000 gallons of water received 1,225 tons of sulphate of alumina and 57,781 pounds of chlorine. The turbid water is rendered reasonably clear of solids by the lime and iron process. Filtration afterward with the application of chlorine and alumina constitutes a "polishing" process which further improves the color and healthfulness of the water. The revenue from water rates in 1915 was \$2,844,837. This revenue can be devoted only to waterworks operation and to the interest and sinking fund for waterworks bonds. The present average daily consumption of water by Saint Louis is 99,000,000 gallons. At the rate of increase in consumption the maximum capacity, which is 150,000,000 gallons per day, will be reached in 10 years. Plans have been drawn for the location of new waterworks on the Missouri River about 20 miles above the mouth, the water to be pumped to one of the highest elevations in Saint Louis County and distributed from a great storage reservoir by gravity conduits to the western part of the city. The intimate relation of the water supply to health has been impressed strongly upon Saint Louis. For a quarter of a century, previous to 1894, water was taken from the river at Bissell's Point, in the upper part of the city, just below the mouth of a large creek which received suburban drainage. The year that the source of supply was changed from Bissell's Point to Chain of Rocks, the present location several miles up the river, the general death rate dropped from 1,935 to 1,700 per 100,000 population. The typhoid death rate was cut from 47 to 23 in 100,000 population. But in 1900 Chicago began sending sewage in

full volume down the drainage canal into the Illinois River. That year the typhoid death rate of Saint Louis began to climb again. It increased to nearly 50 in 100,000 population. The first year of the lime and iron treatment the typhoid rate went down. It dropped to 20 in two years. Since 1906 it has been below 20. With the opening of the filter plant in 1915 a further decline to 10 deaths from typhoid in 100,000 was noted.

Decline of the general death rate has been almost as significant as that of typhoid. The death rate for all diseases was from 1,600 to 1,700 under the influence of the Chicago sewage. It dropped to 1,500 per 100,000 population, and then to 1,400, with the purification process. During 1915, the first year of combined clarification and filtration, the general death rate was below 1,300 per 100,000 population. For several years after the Civil War the water supply was drawn from the foot of Bates street, a mile above the business centre, but below a large residence section. Typhoid epidemics were frequent. The general death rate was as high as 2,300 in some years, nearly twice what it is at present. The waste of lives in Saint Louis from contaminated water during 60 years past has been estimated at 92,706.

History.—"The First Thirty," as the original builders of Saint Louis were called, arrived at the foot of what is now Walnut street the night of 14 Feb. 1764. That night they slept on the large flatbottomed boat which they had poled and dragged along the ice-bound bank of the Mississippi 60 miles from Fort de Chartres. Where the 30 landed was a strip of sandy beach rising gently to the base of a limestone cliff from 35 to 50 feet in height. Through this cliff the water from springs and rains and snows had, in the years, worn a gully. On the morning of the 15th, Auguste Chouteau, a sturdy lad of 13, led the party up the gully to a plateau heavily wooded. He pointed to some recently marked trees. There, on a site now bounded by Main and Second, Walnut and Market streets, was begun the building of Saint Louis. The first structures were the headquarters and warehouses for the fur company of Maxent and Laclede. Maxent was a New Orleans merchant. Pierre Laclede Ligest, the founder of Saint Louis, was the younger son in the ruling family of Bedous, province of Béarn, on the French side of the Pyrennees. He received a military education and came to Louisiana to grow up with the country. Maxent and Laclede were officers in a colonial regiment raised to defend the French settlements from the Indians under British influence in the Seven Years' War. At the close of hostilities Maxent and Laclede were given, by the governor-general at New Orleans, an exclusive grant to trade with the Indians in the Missouri River country. An expedition was outfitted, Laclede investing the Ligest property inherited from his mother and taking command. Leaving New Orleans in August 1763, Laclede reached Fort de Chartres in December. There he learned that France had ceded the territory east of the Mississippi to England and that the fort was about to be evacuated by the French garrison. Storing his goods and taking his stepson, Auguste Chouteau, as a companion, Laclede began an examination of the west side of the river northward to the mouth of the

Missouri. He selected the present site of Saint Louis, marked some trees to guide young Chouteau, and went back to Fort de Chartres. Ignoring the discouraging advice of the French officers, Laclede told them he had "found a situation where he was going to form a settlement which might become one of the finest cities of America." (Une situation ou il allait former un établissement qui pourrait par la suite devenir une des plus belles villes de l'Amérique—Auguste Chouteau's Diary).

Laclede drew the plan of the settlement, organized "The First Thirty," gave Auguste Chouteau command and started the boat, as soon as ice in the river permitted, to begin the building of Saint Louis. Laclede went among the French habitants on the east side, advising them not to go down the river with the garrison but to move to his settlement. Within a few months Laclede was notified from New Orleans that his exclusive grant had been rejected by the French government. Then came more bad news that the king of France had transferred the country west of the Mississippi to his "dear cousin" the king of Spain. Notwithstanding the loss of the grant and the change of sovereignty, Laclede's settlement prospered and became permanent. The remnant of the garrison at Fort de Chartres, headed by Saint Ange de Bellerive, as soon as the English troops arrived, marched to Saint Louis. Government was established with Laclede's house as the capital. Blocks and half blocks and quarter blocks of ground were assigned to permanent residents pending the arrival of the Spanish officials. In five years Saint Louis had secured practical monopoly of the Indian trade not only west but east of the Mississippi and as far north as the Great Lakes and was doing business with 28 Indian nations in open competition. The Spanish governor-general at New Orleans sent an expedition to found a rival settlement at the mouth of the Missouri but it came to nothing. Other attempts to overshadow Laclede's settlement failed. Around Laclede's house centred the development. During the 100 years from 1764 to 1864 the business district of Saint Louis was where Laclede's map had located it in the beginning. The Chamber of Commerce was across the street from the original site of Laclede's house and warehouses. In 150 years the business centre of Saint Louis has not moved a rifleshoot from where the vision of this born engineer saw it should be.

Saint Louis remained under Spanish dominion until 9 March 1804, when the United States government sent Captain Stoddard to receive the transfer of Upper Louisiana from the Spanish governor, Delassus. The population of Saint Louis and immediate vicinity was about 1,000 at that time. A territorial form of government was established with Saint Louis as the capital of the territory. Previous to the transfer, the few Americans who had migrated to the west side of the river had passed Saint Louis and had formed settlements beyond. With the establishment of United States authority at Saint Louis, the influx of Americans from the east side became rapid. In 1808 the first newspaper, the *Missouri Gazette*, was established in Saint Louis. Publication, but under a different name, has been continuous from that time to the present day. In 1809 Saint Louis was incorporated

as a town, the French habitants still being in the majority.

Growth and Crises.—Saint Louis was incorporated as a city in April 1823. The charter was not adopted without opposition. Property qualification restricted suffrage to those who paid taxes. Of 197 votes cast 90 were against the charter. In the election of mayor the line was drawn between the Americans who had come after the transfer of sovereignty to the United States and the settlers under Colonial government. A Pennsylvanian, William Carr Lane, was elected mayor over two candidates of the old régime by a majority of 24. Seven years after incorporation, the census of 1830 gave 4,977 residents. Saint Louis then ranked 44th among American cities. Ten years later, in 1840, it held the 20th place. In 1880 Saint Louis had passed 38 other American cities and had been passed by only one, Chicago. With the union of New York and Brooklyn, Saint Louis became the fourth city. It has held that rank more than two decades. In attaining the present position in population, Saint Louis has passed through three very serious crises. In the period between 1840 and 1850 a single fire destroyed 23 steamboats at the levee, and swept 15 business blocks in the commercial centre of the city, at a loss of \$3,000,000. In that same decade the greatest Mississippi flood of record covered the fertile lowlands to the Illinois bluffs from the mouth of the Missouri to the mouth of the Ohio. Within the period mentioned an epidemic of cholera caused 4,317 deaths. Notwithstanding these drawbacks the population of Saint Louis increased from 16,460 in 1840 to 77,860 in 1850. The European revolution of 1848 and the Irish famine prompted abnormal immigration of which Saint Louis was a large beneficiary. The second of the great crises in the city's history was the Civil War. Previous to 1861 the main traffic routes were between the North and the South. The rivers of the Mississippi Valley gave commercial advantage. Saint Louis was the toll gate of water transportation. The city remained steadfastly loyal to the Union. Chaos succeeded the city's former intimate and profitable business relations with the lower part of the Mississippi Valley. With the return of peace came radical realignment. The main traffic arteries were now east and west. Dominant influences favored the northern routes across the continent. The prestige of Saint Louis suffered.

The third crisis, almost vital it might be said, followed logically the second. Saint Louis had grown rich and mighty on development of water transportation lines. In the decades between 1870 and 1890 rails superseded rivers. The millions of Saint Louis capital invested in boats and navigation disappeared with the decadence of river traffic. Saint Louis was forced to meet the new conditions and did so, but at heavy cost in what had been chief natural advantages.

Population.—The census of 1910 gave Saint Louis 687,029 people. If the rate of increase from 1900 to 1910 be taken as that basis, about 19 per cent, the population in 1916 was 763,750. Previous to the Civil War the foreign population was proportionally much larger than it is now. In 1910 the foreign-born population was 125,706. About one-third of the foreign-born,

47,765, was German. Russia came next with 15,480; Ireland, third with 14,268; Austria, fourth with 11,171. Other nationalities were inconsiderable. The negro population of Saint Louis was 43,960, a comparatively small increase since the days of slavery abolished by a State constitutional convention in 1865.

WALTER B. STEVENS,
Saint Louis, Mo.

SAINT LOUIS, Senegal, West Africa, the capital of the colony known to the natives as Timbuktu or N'dar, is on a small low island near the mouth of the Senegal River. The principal buildings are the cathedral, the great mosque, courthouse, barracks and government buildings, bank, chamber of commerce, public library, printing office; and there is an agricultural society. The gardens of the suburbs and the avenues of palms are attractive features of the town. There are large warehouses and an extensive trade in gums, earthnuts, etc. Water is supplied by an aqueduct seven and one-half miles in length. Pop. about 23,500.

SAINT LOUIS UNIVERSITY, The, located at Saint Louis, Mo., and the oldest university in the Louisiana Purchase Territory, was founded by Jesuit missionaries from Maryland; the beginnings were made at Florissant, Mo., in 1823, when a school for the education of the Indians of the Missouri Territory was established at the request of President James Monroe and the Hon. John C. Calhoun, his Secretary of War. This school was transferred to Saint Louis in 1829, and classes were opened there for white students in 1829. In 1832 the institution was chartered as a university by act of the legislature of Mississippi. In 1842 a medical department was added and in 1843 a school of law. The schools of philosophy and divinity were organized in 1857. In 1888, owing to the encroachments of business, the university was moved to its present quarters and the various departments were erected on the new site with the exception of the school of medicine (1903), which is situated one mile distant. The organization of the university now consists of the College, the Academy, the Commercial Department, Military Science, Normal School, School of Philosophy and Science, School of Divinity and School of Medicine. The College offers two courses, the classical, leading to the degree of A.B., and the scientific, leading to the degree of B.S.; the degree of Litt.B. is also now conferred. The School of Philosophy and Science offers two courses, the philosophical, in which the Latin language and the scholastic method are used, and the scientific, including instruction in mechanics, the sciences and mathematics, with laboratory work. The course of divinity extends over a period of four years, leading to the degree of doctor of divinity. The Military Department is under the management of an officer of the United States army and military drill is obligatory on

all undergraduate students. Religious instruction in Catholic doctrine forms part of the courses; non-Catholic students, however, are exempt if they so wish.

The buildings are: The College, the Academy, the School of Divinity, the School of Philosophy, the School of Medicine and the Normal School. The library contains 75,000 volumes, including the library for undergraduates; there are also departmental libraries in theology, philosophy, science and medicine. The productive funds amount annually to about \$30,000, the students number about 1,500 and the faculty 210.

SAINT LUCIA, one of the Windward Islands, British West Indies, lying south of Martinique; area, 233 square miles. The surface is rugged and mountainous, the mountain sides being mostly covered with dense forests; the valleys and lower heights are fertile and well cultivated. The chief products are sugar, cocoa and logwood; coffee and tobacco are also raised and rum is manufactured and exported. The climate is healthful except in certain low, marshy districts. The island was discovered in 1502, colonized by the French in 1563, was claimed by both England and France and until 1803 its possession several times passed from one to the other. In 1803 it capitulated to the British and was definitely ceded to them in 1814. It then became a part of the government of the Windward Islands. In 1901 there were 44 government schools. Castries, the capital of the island, is one of the most important ports and the second British naval station in the West Indies.

SAINT LUCIE GRASS. See GRASSES IN THE UNITED STATES.

SAINT LUKE, Academy of (ACCADEMIA DI SAN LUCA), an academy of fine arts organized some time previous to 1517, when it was officially recognized by a brief of Pope Gregory XIII. Muziano organized it from the old statutes governing the so-called "Università delle Belle Arti," which itself had grown out of a mediæval guild of painters. During the pontificate of Sixtus V the new organization was placed under the patronage of Saint Luke and the revenues of Santi Martino e Luca were allocated to it. The academy awarded prizes in painting, sculpture and architecture. It received rich endowments from Zuccari and from Clement XI. Canova advocated a new constitution early in the 19th century, which was granted by Pius VII in 1818. The president is elected annually, there are 36 academicians, architects, painters, sculptors. The academy maintains a school of design in which is given instruction in architecture, painting and sculpture. The academy is housed in Via Bonella, where it maintains priceless collections. It now receives an income of \$7,000 from state funds. Consult Armand, 'L'Académie de Saint Luc à Rome' (Rome 1866).

SAINT LUKE, Guilds of, were associations of painters organized in mediæval times under the patronage of Saint Luke. The guilds flourished for many years in Holland and admitted as members engravers, printers and other artists.

SAINT MALO, *săñ mā-lō*, France, in the department of Ille-et-Vilaine, at the mouth of

the Rance, on the English Channel, occupies a rocky island, 43 miles northwest of Rennes. It communicates with the mainland by a causeway called Le Sillon. The harbor affords a total quayage of more than two miles. The principal buildings are the custom-house, chamber of commerce, the parish house of the 15th century, school of hydrography, the Hôtel-de-Ville, with a museum and library, the Casino and statue of Chateaubriand before it, and the ancient castle. The manufactures are hosiery, nets, sailcloth, cordage. It is an important seaport and shipbuilding is one of the chief industries. There is trade in corn, fruit, wine and provisions, chiefly with England and the Channel Islands. Pop. about 12,000.

SAINT MARC, Fr. *săn măr̃k*, Haiti, town on Saint Marc's Bay, on the west coast, 44 miles northwest of Port-au-Prince. Near the town is a headland known as Crête a Pierrot, which was strongly fortified by English engineers and occupied by native soldiers in the war of independence, who here made a strong resistance against the French. It is the shipping port for a fertile valley and exports chiefly coffee and logwood; the town also contains several distilleries. Pop. 20,000.

SAINT-MARC-GIRARDIN, *săn măr̃k zhē-rār-dăn*, François Auguste, French statesman and author: b. Paris, 12 Feb. 1801; d. 11 April 1873. He was educated at the Collège Napoléon and at the Collège Henri IV, and in 1834 occupied the chair of poetry at the Sorbonne, having exchanged it for that of history, held for a short time previously. His political life began also at this time as a member of the Chamber of Deputies. In 1871 he was elected to the National Assembly and was its vice-president when he died. Among his best-known books are 'Political and Literary Notes on Germany' (1835); 'Essay on Literature and Morals' (1845); 'Course of Dramatic Literature; or, The Use of the Passions in the Drama' (1843-77); 'La Fontaine and the Fabulists' (1867); and 'Jean Jacques Rousseau, His Life and Works' (1875).

SAINT MARK'S CHURCH (San Marco). See **VENICE**.

SAINT-MARTIN, *săn măr-tăn*, Louis Claude, French philosopher: b. Amboise, France, 18 Jan. 1743; d. Aurai, near Chatillon, 14 Oct. 1803. He traveled through Germany, England, Switzerland and Italy, making converts to his mystical philosophy, which he had derived from a study of the works of Jacob Böhme. His followers styled themselves "Martinists" and held that man on one side of his nature was a type of the universe, a microcosm; on the other the thought and reflection of God. By introspection all knowledge and wisdom could be reached. Of his works the most important are 'Des erreurs de la verité' (1775); 'De l'esprit des choses' (1800); 'L'homme de desir' (1790). Consult Caro, 'Essai sur la vie et la doctrine de Saint-Martin' (1852); Matter, 'Saint Martin le philosophe inconnu' (1864).

SAINT MARTIN, *sănt măr-tîn* (Fr. *săn măr-tăn*), an island of the Lesser Antilles, lying north of the Leeward Islands and east of Porto Rico; area, 37 square miles. Its surface

is hilly, the elevation being highest in the centre of the island. In the southern part are several salt lagoons from which considerable quantities of salt are obtained. Sugar is the chief agricultural product, rum is manufactured and sugar, rum and salt are the chief exports. The island was settled in 1638 by French and Dutch, who were later driven out by the Spaniards. In 1648 they regained possession and divided the island between them, the French taking the northern portion (20 square miles); and the Dutch the southern portion (17 square miles); the French portion is a dependency of Guadeloupe, the Dutch, a dependency of Curaçao. Pop. 7,000.

SAINT MARTIN'S DAY. See **MARTIN I**, **SAINT**.

SAINT MARY HALL, originally this was the parsonage-house of the rectors of Saint Mary's Church, Oxford, until it was presented by Edward II in 1326 to Oriel College. It then became a university hall and the office of principal was held by Oriel fellows to 1656, from which time the chancellor exercised right of nomination. In 1902 it was regularly incorporated with Oriel, in which its site, buildings and property are now vested.

SAINT MARYLEBONE, *mér-l'lē'bôn*, England, a metropolitan borough in the northwest of London and a favorite residential district. Area, 1,473 acres. Regent's Park contains the Zoological Gardens and the Gardens of the Royal Botanical Society. Lord's Cricket Ground, the headquarters of the Marylebone Cricket Club (M.C.C.), Queen's Hall, a favorite concert hall, Madame Tussaud's waxwork and Harley street, mainly occupied by doctors, are all in the borough, which returns two members to Parliament. Pop. 118,160. Consult Clinch, 'Marylebone and Saint Pancras' (1890); Smith, 'Account of the Parish of Saint Marylebone' (1833).

SAINT MARYS, Canada, town and outport in the province of Ontario, on the Thames River, 100 miles southwest of Toronto, on the Grand Trunk and the Canadian Pacific railways. Agricultural implements are manufactured here, and there are saw, grist, oatmeal and flax-mills. Pop. 3,388.

SAINT MARY'S, Md., the first settlement made in the State. In 1634 Governor Calvert in his ship, the *Ark*, sailed up the Potomac to Saint Mary's River and bought land of the Indians and established a settlement near the mouth of the Saint Mary's. A Jesuit mission was established; many of the settlers, however, were Protestants and absolute liberty of worship prevailed. Though Saint Mary's was the capital of Maryland and for a number of years the only town in the colony, it was never more than a small settlement. In 1694, after Maryland became a royal colony, the capital was moved to Annapolis and Saint Mary's fell into decay.

SAINT MARYS, Ohio, city in Auglaize County, on the Lake Erie and Western, Toledo and Ohio Central and the Western Ohio Traction line, about 25 miles southwest of Lima. It was settled in 1795, by whom is not positively known; but some county historians give the credit to Charles Murry. It was incorporated

in 1820, and became a city under the new code, June 1903. It is in an agricultural region and in the oil belt, but it has large manufacturing interests. The chief manufacturing establishments are chain works, spoke works, woolen mills, machine shops, box factory, straw board works and other smaller factories. The total number employed in all the manufactories is about 1,000. There are eight churches; and the educational institutions are public and parish schools and a business college. The three banks have a combined capital of \$180,000; the annual amount of business is \$1,200,000. There are two building and loan associations, one daily and two weekly papers. The government is vested in a mayor, council and marshal. The council is composed of four members and three at large, who hold office two years. Pop. 5,732.

SAINT MARYS, Pa., borough in Elk County, 100 miles northeast of Pittsburgh, on the Pennsylvania and the Pittsburgh, Shawmut and Northern railroads. There is a Roman Catholic convent school of the Sisters of Saint Benedict here. In the surrounding district there are deposits of bituminous coal and fire clay, and there is an abundant supply of natural gas. Manufactures include flour, electrical supplies, fireproofing material, sewer pipe and wood alcohol. Pop. 6,346.

SAINT MARYS, a river connecting Lake Superior and Lake Huron. It receives the overflow of Superior and discharges its waters into Huron. A fall of 22 feet in the river at Saulte Sainte Marie was an obstruction to navigation. Two canals have been made; one on the United States side of Saint Marys' Falls, and the other on the Canadian side. The United States canal was opened June 1855. This canal is now one and one-half miles long, 100 feet wide at the bottom, and 20 feet deep. Hay Lake Channel, adjoining Saint Marys River below the falls, has shortened, by 11 miles, the passage from Huron to Superior. Navigation is closed by ice part of the year. The registered tonnage the first year through the United States canal was 106,296, and for 1900, 20,136,782. The canal on the Canadian side was opened in 1895. The total freight traffic of both canals in 1915 was 71,290,304 short tons. The river is spanned by the International Bridge at Saulte Sainte Marie. There are a number of well-wooded islands in the river, all of which are favorite summer resorts. See **BOUNDARIES OF THE UNITED STATES**.

SAINT MARY'S CHURCH, Cavalry Engagement at. General Sheridan, after his Trevilian raid, arrived at White House, on the Pamunkey, 21 June 1864. On the 22d the depot at White House was broken up, Grant having established a new base at City Point, and a train of 900 wagons set out, under cover of Sheridan, to cross the James River on the pontoon-bridge at Bermuda Hundred. It crossed the Chickahominy at Jones' bridge and moved to Charles City Court House en route past Malvern Hill, in advance of which were Wade Hampton's and Fitzhugh Lee's cavalry divisions which had kept close to Sheridan after the battle of Trevilian Station (q.v.) and were now hanging on his flank. Keeping Torbert's division with the trains, Sheridan sent General Gregg, with his division and two batteries to Saint Mary's Church, to cover the exposed flank, and Gregg

intrenched in a strong position. There was some skirmishing during the 24th, and late in the afternoon Hampton and Lee attacked Gregg on the right flank and in front, and after a stubborn contest forced him to give way, in some confusion, Sheridan says, but losing no material. Gregg, however, asserts that though the contest was unequal he retired without confusion or disorder; but he left his dead and wounded on the field. Hampton pursued to within two and one-half miles of Charles City Court House. The trains were moved back to Doutharts' Landing on the James and were ferried over, Sheridan following them across on the 26th. The Union loss as reported was 29 killed, 188 wounded and 122 missing. The loss in Hampton's division was six killed and 59 wounded. Fitzhugh Lee's loss is not reported.

SAINT MARY'S COLLEGE, located at Saint Mary's, Marion County, Ky. It was founded in 1821 by the pastor of the Catholic settlement as Saint Mary's Seminary; in 1833 the Jesuits took exclusive control, and the name was changed to Saint Mary's College; in 1837 the college was legally incorporated. A college farm was conducted, and all students were required to work one day every week on the farm. In 1846 the Jesuits abandoned the control of the college, and in 1847 it was transferred to the charge of the secular clergy of the diocese of Louisville. Financial difficulties resulted in its being closed from 1869 to 1871, and in the latter year it was reopened under the charge of the Fathers of the Congregation of the Resurrection, a teaching order, and was later recognized as the official Roman Catholic college of the diocese of Louisville. The courses are divided among three departments, the commercial or English high school, the academic or classic high school, the classic or collegiate departments; the courses of the first two departments occupy three years, the course of the collegiate department, four years; the degree of A.B. is conferred on graduates of the collegiate department; A.M. is conferred for one year's graduate work. The library numbers over 7,000 volumes, and is being steadily increased; the annual income \$30,000; the students average 120, and the faculty 12.

SAINT MARYS FALLS CANALS. See **SAULT SAINTE-MARIE CANALS**.

SAINT MARY'S SEMINARY, a Roman Catholic theological school in Baltimore, Md.; opened 30 Oct. 1791. From the first the seminary has been in charge of the Society of Saint Sulpice, an organization founded by Father Olier, in 1642, for the purpose of preparing young men for the priesthood. On the site of the present institution, when the Fathers purchased the place, was the well-known "One Mile Tavern." There were only five students in the school during the first three years, and in 1806 only 12 students. The superior-general of the Sulpicians had about decided to withdraw his professors, as they were much needed in other schools; but the entreaties of Bishop Carroll and the advice of Pope Pius VII prevailed, and the school continued its work. For a time Saint Mary's College, Baltimore, now replaced by Loyola College (1852), and Mount Saint Mary's College, Emmitsburg, were affiliated with the seminary. The latter ceased to be

a part of Saint Mary's Seminary, Baltimore, in 1826. Saint Mary's Seminary was raised by the Maryland legislature in 1804 to the rank of a university, with power to confer degrees in the different departments of the sciences upon such of the students and clergy as satisfy the examination requirements. A student to obtain admission to the seminary must have a well-formed desire to study for the Roman Catholic priesthood, be recommended by his ecclesiastical superior, and for the first year of philosophy, must have completed a full classical course, and pass a satisfactory examination. Students from other schools may be admitted to such courses as their examinations may entitle them. The main library contains about 50,000 volumes; special libraries are in the departments of theology and philosophy. There are well-equipped reading and study rooms. Particular attention is given to music, especially the Gregorian and Plain Chants. The members of the Association of Saint Camillus, which began in 1894-95 and was organized in 1898, visit hospitals and other institutions. Recently they had on their visiting list 15 institutions. In 1903 a scholarship was founded by Dr. Charles S. Grindall of Baltimore, for the benefit of "a native of the archdiocese of Baltimore studying for the missions of the same archdiocese." Attendance is not limited to any diocese or country. The faculty comprises 22 instructors, the annual average attendance of students is 340.

SAINT MAURICE, Canada, a river in the province of Quebec, flowing into the Saint Lawrence at Three Rivers. Its course of 300 miles is marked by fine scenery, and waterfalls, one of which, 22 miles from its mouth, has a height of 160 feet.

SAINT MICHAEL (formerly **REDOUBT SAINT MICHAEL**), Alaska, a settlement on Saint Michael's Island, in the southern part of Norton Sound; lat. 63° 28' N.; long. 162° 5' W. The settlement, or trading post, was founded in 1833 by Tebenkoff. The island is low and volcanic and is covered with vegetation. Saint Michael is the port where ocean steamers transfer and receive freight which is carried up and down the Yukon. The river vessels pass through the Aphoon Channel, behind a bar, and enter the Yukon by its northern passage. Navigation opens in June and closes in September. After the discovery of gold, Saint Michael became important. During the summer there is a population of between 3,000 and 4,000. Many of the permanent residents are Eskimos. Pop. about 400.

SAINT MICHAEL'S, or **SÃO MIGUEL**. See **AZORES**.

SAINT MICHAEL'S COLLEGE, Vermont, a Catholic institution of higher learning at Winooski Park, near Burlington, opened in September 1904, and incorporated 28 Jan. 1913 by act of legislature, with powers to grant the usual college degrees. The buildings stand on high ground overlooking the beautiful valley of the Winooski River, and commanding a fine view of Mount Mansfield to the east, of Lake Champlain and of the Adirondacks to the west. The preparatory or academic department furnishes both classical and commercial courses, the collegiate department a liberal course leading to the degree of bachelor of arts (A.B.). Several scholarships have been established. The

faculty numbers nine; the annual attendance of students average 100. The tuition fees are \$50; board and living expenses \$200 per annum.

SAINT MICHAEL'S MOUNT, England, in Cornwall; three miles east of Penzance, is an isolated rock of conical form, about 200 feet high. An ancient and picturesque castle stands upon its summit, from whose tower projects the stone lantern called "Michael's Chair." A causeway connects the island with the shore. A fishing village with a projecting harbor nestles at its base. The hill is a geological curiosity, being a vast mass of granite protruding through schistous rocks. In remote times Edward the Confessor founded upon it a Benedictine priory, which at the time of the Conquest was annexed to the abbey of Mount Saint Michel in Normandy. Its possession was disputed during the Lancastrian and Parliamentary wars. After a considerable period it passed from the monks into secular possession, becoming a manorial residence, and in 1660 the property of the Saint Aubyns.

SAINT-MICHEL, *săn mē-shēl*, Mont, France. See **MONT-SAINT-MICHEL**.

SAINT MORITZ, or **SAINT MAURICE**, Switzerland, mountain resort and watering-place in the Upper Engadine, canton of the Grisons, 42 miles east of Geneva. Its altitude is 6,037 feet, the highest of any village in the Engadine. The springs of chalybeate and carbonic acid are about a mile south of the village. The waters were reported by Paracelsus in 1589. Saint Moritz is popular as a year-round pleasure and health resort. The scenery is magnificent. Pop. 1,684.

SAINT NAZAIRE, *săn nă-zâr*, France, a seaport town in the department of Loire-Inférieure, near the mouth of the Loire and 40 miles west of Nantes by rail. Great improvements have been carried out in the port. The town is the terminus of the General Transatlantic Company, and the shipbuilding yards of this company and that of the Loire employ about 2,500 men. Extensive forges employ 1,600 men in the manufacture of steel rails, sheet and bar iron, etc. The town is of recent growth and these industrial works form its chief buildings. Of peculiar interest in the vicinity is an ancient granite dolmen, 10 feet long and five wide, resting horizontally on two stones, which extend about seven feet above the surface of the ground. It is believed that Saint Nazaire occupies the site of the ancient maritime town of Corbilo, in whose harbor the Roman fleet was built (56 B.C.) with which Brutus routed the Venetian insurgents. Pop. about 38,000.

SAINT NICOLAS, *săn nē-kō-lā*, Belgium, in the district of Dendermonde, in East Flanders, 12 miles by rail southwest of Antwerp, occupies a central position in the densely populated region of Waes. The most important buildings are the town-hall and churches. It is an agricultural and manufacturing centre and has a large flax market and manufactures of cotton, wool, lace, needles, bricks and pottery. There is considerable trade in linens, flax, corn, etc. It is celebrated as the place where Philip the Fair about the beginning of the 14th century swore to maintain the privileges of Waesland, of which Saint Nicolas was the capital. Pop. about 32,000.

SAINT OLAF COLLEGE, located at Northfield, Minn. It was founded by the pastor of the Norwegian Lutheran congregation of Goodhue County in 1874; until the year 1886 it had only an academic (secondary) department; from 1886 to 1890 it gradually developed into a college, and in 1890 was officially placed under the control of the United Norwegian Lutheran Church. Though this official connection was severed for a time in 1893, the college continued to be closely affiliated with the denomination, and in 1899 the official relation was re-established. In 1900 the college department of the United Church Seminary was united with Saint Olaf College. The organization of the college includes two departments: the Academic Department and the Collegiate Department. The collegiate department offers two courses, classical and scientific, leading to the degree of A.B. and B.S.; a few electives are offered in the junior and senior years. The academic department has three courses, the classical and scientific, especially designed to prepare students for the corresponding collegiate courses, and the English course; the latter includes instruction in bookkeeping, commercial law and domestic economy. Biblical or church history forms a part of the curriculum in both departments; and there is a musical department providing courses in piano and voice culture. The Steensland Library building was completed in 1902 and contains the museum and a library of 8,000 volumes. The college is coeducational. In 1915 there were 555 students and a faculty of 34. There is a regular endowment of \$250,000.

SAINT OMER, sǎn-tō-mār, France, a fortified city in the department Pas-de-Calais, 26 miles southeast of Calais, on the Aa River. It is situated on a marshy site, has two harbors and begins the canalized portion of the Aa. The Gothic cathedral is old and curious. It has fine portals (13th-14th centuries), good paintings, interesting statues and monuments, wood carvings and fine stained glass and mosaics. The other notable points of interest are the ruined tower and arches of the Benedictine abbey of Saint Bertin and a museum. The church of Saint Sepulchre is remarkable for its beautiful stone spire and stained-glass windows. The town-hall contains valuable records, a picture gallery and a theatre. There is a large public library and extensive arsenal. Saint Omer manufactures tobacco pipes, cloth, hosiery, tulle, cambric and muslin embroideries. Its trade is in these articles and in paper, flour, sugar, beer and other liquors. The town has often suffered from attack and invasion by the French, Flemish and Spaniards.

SAINT OUVEN, sǎn-too-ōn, France, a suburb of Paris, in the department of the Seine, about one mile southwest of Saint Denis, is an important manufacturing centre and river-port, with spacious docks. The industrial establishments include foundries, forges, machine and glass works, sugar and sawmills and manufacturing of rubber-goods, varnish, printer's ink, canned foods and firearms. Here in 1814 Louis XVIII promised, over his signature, a constitutional charter to France. Pop. about 42,000.

SAINT OURS, sǎn-toorz', Jean Baptiste de, SIEUR D'ESCHAILLONS, French-Canadian

soldier: b. Canada, 1668; d. Montreal, 1747. His father, Pierre de Saint Ours, was the first of the family to come to Canada, and obtained extensive grants of land. The son entered the army at an early age and in 1702 was made lieutenant. He was one of the commanders of the expedition against Fort Orange (Albany) in 1708. He commanded a company in De Ramezay's expedition against the English in 1710, and in 1721 was sent on a special mission to several Indian tribes by the governor, De Vaudreuil. On this expedition Saint Ours endeavored to put a stop to the liquor traffic with the Miamis, and tried to bring about peace between the Sioux and their enemies; also induced the Creeks to form a single village. On his return he subsequently became king's lieutenant of Montreal.

SAINT PANCRAS, England, a metropolitan and Parliamentary borough of London, lying east and north of Regent's Park. Area, 2,694 acres. It is well supplied with open spaces, which include Parliament Hill and Primrose Hill. The great railway terminals of Saint Pancras, King's Cross and Euston Square are within the borough, which has been the pioneer in the metropolis of the municipal supply of electricity. Saint Pancras returns four members to Parliament. Pop. 218,387. Consult Clinch, 'Marylebone and Saint Pancras' (1890); Coull, 'History of Saint Pancras' (1861); Miller, 'Saint Pancras Past and Present' (1874); Palmer, 'Saint Pancras' (1870); Roffe, 'Perambulating Survey of Saint Pancras' (1865).

SAINT PATRICK'S COLLEGE, a theological school in Maynooth, Ireland. It was founded in 1785 and endowed, the only Roman Catholic institution in Ireland which received a government endowment. Several attempts were made to repeal the act granting this aid, and in 1869 the opponents in Parliament were successful. The college received, in lieu of its annual income, a capital sum equal to 14 times its annual endowment. The college is now affiliated with the National University of Ireland. It has a large faculty, well-equipped library, laboratory and study-rooms. There are from 500 to 600 students in attendance each year. A large number of the students, who have been ordained priests, have been sent to all parts of the world, especially to North America, South Africa and Australia; and have filled all ecclesiastical positions from the missionary among savages to that of archbishop.

SAINT PAUL, the Apostle to the Gentiles. According to Acts xxi, 39 Paul was a native of Tarsus, the most important city of Cilicia. His parents were of pure Jewish descent, for he could boast that he was "of the stock of Israel, of the tribe of Benjamin, a Hebrew of the Hebrews" (Phil. iii, 5). His father, however, was a Roman citizen. How he had acquired this privilege we are not told. It may have been purchased or obtained in some other way. Paul was content to say that he was freeborn. Tarsus was a centre of Greek culture and the son of a citizen of that town had ample opportunities to secure the best classical education the times afforded. To what extent Paul shared these advantages is not stated, but his words (Acts xxii, 3) appear to mean that at a comparatively early age he was sent to Jerusalem

to receive a *Jewish* rather than a Greek education. The social status of Paul's parents may have been high. There are good reasons for thinking that the family was wealthy. (Consult Ramsay, 'Saint Paul the Traveller,' etc., pp. 310 ff). However, this did not interfere with the good Jewish custom of teaching the boy a trade. That he learned to make tents was the more natural since the wool of the long-haired Cilician goats was extensively used for tent-cloth. It is probable that he learned his handicraft before he went to Jerusalem for his education.

Like other individuals with two names in the New Testament he was more familiarly known in Jewish circles by his Hebrew name, Saul. Paul was his Roman name, the cognomen given him probably by his father, for what reason we do not know. As his life work developed and he felt himself called to minister to the great Gentile world he preferred his Roman-Greek name to the Hebrew one.

The date of Paul's birth cannot be fixed with exactness. In his letter to Philemon (9), written probably about 60 A.D., he calls himself an elderly man (*πρεσβύτερος*). This may be taken as signifying, approximately, one who has attained his 60th year. Probably he was born within a very few years of the beginning of the Christian era.

His personal appearance was not imposing. His opponents could easily admit that his letters were powerful and at the same time remark that "his bodily presence was weak and his speech contemptible" (2 Cor. x, 10). A very ancient tradition in Asia Minor speaks of him as "baldheaded, bow-legged, strongly built, a man small in size, with meeting eyebrows, a rather large nose, full of grace, for at times he looked like a man and at times he had the face of an angel." (Consult Ramsey, 'The Church and the Roman Empire,' ch. xvi). Behind such an unattractive exterior lay a physical nature capable of enduring the severest strains (see 2 Cor. xi, 23-28) and a soul endowed with most varied gifts in rich abundance.

To the young Jew of Tarsus the opportunity to study in Jerusalem at the feet of Gamaliel (Acts xxii, 3), one of the most learned rabbis of his day, was a privilege to be used to the utmost, no mere parent-imposed task. Proud of his Pharisaic ancestry and training the young man eagerly pursued his studies "advancing in Judaism beyond many" of his associates, "being more exceedingly zealous for the traditions" (Gal. i, 14). He studied the Old Testament and especially the Law not merely as the authorities for the national religion or for orthodox Pharisaic theology, but as the foundation and source of his personal religion. He was anxious to attain the righteousness demanded by the Law. So far as externals went he succeeded in doing this (Phil. iii, 6). But the more thoroughly he probed his religious experience the more hopeless his case seemed. The sentence of the Law became to his sensitive conscience the sentence of death (Rom. vii, 7-25).

It was while Paul was thus pursuing his studies in the rabbinic schools that Jesus the Messiah lived and died. Whether Paul was in Jerusalem on any of the occasions when Jesus visited the place, or whether he ever saw Jesus in the flesh is doubtful. (2 Cor. v, 16 does not necessarily imply this). However that may have

been, Paul's opposition to Christianity did not begin with the first Christian preaching. Not until the early Church had become well started, when such a teacher as Stephen began to declare the merely temporal character of Jewish ordinances, was Paul's opposition aroused. We meet him first in the record of the martyrdom of Stephen at which the witnesses laid down their garments (Acts vii, 58, cf. Deut. xvii, 7) "at the feet of a young man named Saul, who was consenting to his death" (Acts vii, 58, viii, 1). Though too young to have been a member of the Sanhedrin (Acts xxvi, 10 does not mean this) he stood high in the favor of the Jewish authorities and was only too willing to take the lead in a general persecution of all Christians in Palestine and adjacent lands. After having caused the imprisonment of many in and about Jerusalem, some of whom were put to death, while others suffered great indignities (Acts xxvi, 10-11, xxii, 19, ix, 1, Gal. i, 23), he secured authority from the chief priests to proceed to Damascus and take action against any Christians he might find there (Acts ix, 1, xxii, 5, xxvi, 12).

But Paul was not to enter Damascus as a persecutor. As he and his party neared the city a sudden and most profound transformation took place. Paul had a vision, in which he saw Jesus the Nazarene and heard Him ask "Saul, Saul, why persecutest thou me?" (cf. Acts, ch. ix, xxii and xxvi, and also Gal. i, 15, 1 Cor. ix, 1, xv, 8). It was enough. Henceforth Paul's entire point of view was changed. God had "revealed His Son" in him. He had seen Jesus as *Lord*. It meant parting with all his past, though as yet he saw this only as to some main points. Above all, it revolutionized his idea of Jesus. That one had been to him only the justly crucified leader of a heretical movement. He was now and evermore the glorified Messiah. Accepted as a brother by the believers in Damascus, Paul soon began to proclaim Jesus as the Messiah to the Jews there. This only aroused their hostility and they plotted to get him in their possession. He succeeded in escaping (Acts ix, 25, 2 Cor. xi, 32) and made his way into Arabia (Gal. i, 17) where he stayed for upward of three years, not "conversing with flesh and blood," that is, not seeking light or instruction from those who had been Christians before him, but in meditation and communion with God, seeking to sound the depths of that great revelation that had been granted him. What struggles and conflicts he then went through, what changes of view on many details of his Jewish belief, what great revolutions of opinion, what new-found hopes and convictions he now experienced—we can see all these reflected in his later speeches and letters. Finally he was able to outline the main points involved in his new faith. That Jesus of Nazareth was and is the Son of God, that in His death forgiveness of sin is made possible, and that through faith in Him forgiveness and salvation are made a personal possession,—these formed the core of his gospel of the cross, a gospel that no man taught him, but which came to him from God (Gal. i, 11).

He was now ready to learn details about Jesus' earthly life and ministry. He, therefore, returned to Damascus and then visited Jerusalem especially to talk with Peter. Having gained what he desired from Peter and by his

preaching having aroused the opposition of his former associates in Judaism, he soon left Jerusalem and went into "Syria and Cilicia" (Gal. i, 21; cf. Acts ix, 30). After some years' labor in these regions, he was sought out by Barnabas and persuaded to join that good man in the work of building up the new church at Antioch, the metropolis of Syria. This church had almost from the first considered Gentiles as worthy to be approached directly with the Gospel message. In such an atmosphere Paul's own view of the Gospel as suited for man as man independent of his antecedents found room for full expression. After laboring here for a year Paul, with Barnabas, was delegated to carry an offering from the church at Antioch to the mother church at Jerusalem (Acts xi, 27-30, xii, 25). Since Paul makes no mention of this visit in his survey of his connection with the mother church in Galatians i and ii, it is probable that it was of no special importance to Paul personally. Returning to Antioch accompanied by John Mark of Jerusalem, Barnabas' cousin, it was soon decided to organize a mission to the adjacent lands. At a meeting of the church Barnabas and Paul were formally set apart to this work through prayer and laying on of hands (Acts xiii, 1-3).

Taking with them John Mark as assistant, the two set out on the First Missionary Journey (Acts xiii, 4-xiv, 28). Cyprus was first visited and traversed from end to end, then crossing the sea to the mainland they disembarked at Perga of Pamphylia. Here they decided to strike inland. For some reason Mark deserted them now and returned to Jerusalem. From Perga they proceeded to Antioch of Pisidia. At this important centre of trade the missionaries stopped. Paul delivered an address in the Jewish synagogue, in which he sought to convince them that Jesus was indeed the Messiah promised in the Scriptures. So great was the interest aroused that a second address was asked for the following Sabbath. At this meeting the majority in the synagogue refused to accept the message and the missionaries then turned their attention to the Gentiles. A Christian Church was soon organized in which naturally Gentiles and Jews met on equal terms. The work grew rapidly but the opposition of the Jews of the synagogue became so bitter that Paul and Barnabas thought it best to leave. From Antioch they proceeded eastward to Iconium, where they met with much the same experience. From Iconium they went on to Lystra and thence to Derbe. At Lystra, the home of the future disciple, Timothy, the healing of a cripple led the pagan multitude to think that the gods were again visiting the earth. All these towns were on a great commercial highway leading through southern Asia Minor from Asia to Europe and, though originally belonging to different nations, were then all included in the great province of Galatia. Consequently the churches founded on this journey may be those to whom the apostle addressed the Epistle to the Galatians (q.v.). From Derbe the missionaries retraced their steps and arriving at the coast sailed directly to Antioch without revisiting Cyprus. The journey, which probably covered about a year and a half, had been a complete success. It proved

how the Gospel was capable of being applied to and understood by the pagan world.

Just at this time extremely conservative Jewish Christians from Jerusalem disturbed the peace of the Antioch Church by teaching, as the orthodox view, that Gentiles, in order to be saved, must not only profess faith in Jesus Christ and be baptized, but also be circumcised and obligate themselves to keep the Jewish law. What part Paul took in the discussion at Antioch we do not know, but so serious was the situation seen to be that the church decided to refer the matter to the apostolic body at Jerusalem and delegated Barnabas and Paul to represent them at the council so summoned.

The probable date of the Apostolic Council was 49 A.D. or possibly 48. If Paul counts the "fourteen years" of Gal. ii, 1 from his conversion, then that event took place somewhere near 35 A.D. If the 14 years is to be counted from his visit to Jerusalem to see Peter (Gal. i, 18) then his conversion must have been as early as about 32-33 A.D. The report of the council in Acts xv needs to be supplemented by Paul's own statements in Gal. ii, 1-10. The result was a victory for Paul, at least to this extent, that the mother church put itself on record as recognizing the legitimacy of the Gentile Christian movement and refused to order that Gentile Christians should be circumcised. To Paul himself was given full recognition of his Apostolic status.

Soon after their return to Antioch, Paul proposed to Barnabas that they revisit their churches in Galatia. Barnabas wished to take Mark. Paul would not consent to this since Mark had deserted them on the first journey. The contention was sharp and the two friends separated. Paul now set out with Silas (Silvanus) as his companion on his Second Missionary Journey (Acts xv, 40-xviii, 22, 49-51 A.D.). Entering Asia Minor through the Cilician gates, in due time they arrived at Derbe and Lystra. Here they were joined by Timothy, a choice young convert. After spending some time with the churches organized on the first journey, they moved on through Asia Minor, perhaps founding some new churches in Galatia (see GALATIANS, EPISTLE TO), and finally arrived at Troas, where, possibly, Paul met Luke. The "we" sections of Acts begin at this point (Acts xvi, 10). Here the night vision of a Macedonian man calling for help convinced Paul that the Gospel must be carried into Europe. Crossing over to Macedonia, at Philippi, at Thessalonica and at Berea, all Macedonian towns, Paul succeeded in organizing churches. His method was essentially the same in all cases,—first to address the Jewish inhabitants at their synagogue or other meetings, and then, when hostility manifested itself, to withdraw his adherents from the synagogue and organize a church of the free Gentile Christian order. The discontented Jewish element followed him with dangerous persecution and it was to avoid falling into their hands that he left Berea hastily and went on to Athens. Here apparently was an uninviting field. The city of philosophers and idlers was not thirsting for the Gospel of Paul. But in spite of misgivings he delivered his famous address on Mars Hill. Perhaps nowhere does Paul's versatility and breadth of view, his profound conception of the universal character of the Gos-

pel message show itself as it does here in this address. But Athens was not prepared for such a message and as soon as his helpers arrived from Macedonia with the report of the conditions there he sent Timothy back to Thessalonica (1 Thess. iii, 1), while he himself (with Silas, see Acts xvii, 15 and xviii, 5) pushed on to Corinth. Making the acquaintance of Aquila and Priscilla, Jews lately banished from Rome, he joined them in working at the tent-maker's trade. At first he had little success, but the arrival of Timothy from Macedonia with news of the devotion and constancy of the disciples there stirred him to new efforts (cf. 1 Cor. ii, 1 ff; 1 Thess. iii, 1-6; Acts xviii, 1-8). For a year and a half Paul was busy at Corinth. To organize and build up a Christian community in that large, gay, wicked, commercial metropolis was no easy task. It was while here that he wrote his two letters to the church of Thessalonica. The first one was occasioned by Timothy's arrival with good news and is full of words of commendation and hope. The second was written to counteract certain wrong views or inferences, mainly of statements in the first letter. These epistles, perhaps the earliest of the New Testament books, show us the Apostle's mind before the great doctrinal conflicts of the next few years had engaged his attention. The long stay in Corinth was perhaps shortened by the unsuccessful attempt of the Jews to have him tried by Gallio, the Roman pro-consul. Though this came to nothing Paul seems to have left Corinth soon after (fall of 51 A.D.) and crossing over to Ephesus with Aquila and Priscilla he hastened on to Antioch (Acts xviii, 18-22).

His stay in Antioch was not a long one. He soon found himself on his Third Missionary Journey (Acts xviii, 23-xxi, 17, fall of 51 to spring of 55 A.D.). Rapidly going through his old field in Galatia he arrived at Ephesus, then the great commercial emporium of Asia Minor. Here for nearly three years he made his headquarters. For Paul this was a period of most intense activity. Ephesus was a meeting place for all sorts of philosophical and religious speculations. As the patron city of the worship of the great goddess Artemis (Diana) whose temple outside the city walls was one of the wonders of the world, it was a stronghold of paganism and superstition. It was an open door, "but there were many adversaries" (1 Cor. xvi, 9). But it was not alone in Ephesus that "adversaries" were opposing the Apostle. In his old churches in Galatia and in Corinth enemies were sowing seeds of discord. The mischief-makers were members of the extreme Judaistic party, whose opposition to Paul's Gentile Christianity had necessitated the council at Jerusalem in 49 A.D. Only apparently defeated there they determined to carry the conflict into the churches founded by Paul himself. Their arguments were, mainly, that Paul was only a secondary apostle, not one of the original 12, that his gospel was, therefore, only one derived by false reasoning from the normal gospel of Judaistic Christianity, and that Paul's principles practically made the whole Old Testament, especially the Law, of no character or value whatsoever. Only too many in Paul's own churches were ready to listen to such teaching. From Galatia and from Corinth there

came news to Ephesus of factions strife, of the adoption of Jewish customs and of growing hostility to himself on the part of those he had taught and trusted. But Paul, though bitterly disappointed and sorely tried, was equal to the emergency. In the Epistles to the Galatians and Corinthians he tried to deal with these vexatious and difficult problems. In them he successfully met the points raised by his assailants and, at least in the case of the church of Corinth, succeeded in winning the church back to himself. For the details of these matters readers are referred to special articles on these Epistles. During his sojourn at Ephesus "all Asia" (Acts xix, 10) had the advantage of Paul's missionary activity. Not long after the tumult caused by Demetrius the silversmith (xix, 23-41) he set out for Corinth, but, uncertain of the reception accorded to his first letter (1 Corinthians) and subsequent messages, he took the indirect route via Troas and Macedonia. In Macedonia Titus came from Corinth with most encouraging news (2 Cor. vii, 5-7) and Paul gladly pushed on to revisit the Corinthian church. He stayed at Corinth during the winter of 54-55 A.D. Before leaving Greece for his long contemplated visit to Jerusalem he penned his most comprehensive and important epistle, to the Christians of Rome, in which he set forth the great fundamentals of the Christian theology and thus prepared them for the visit he had in mind to make them. (See ROMANS). Paul now hastened to Jerusalem, not stopping at Ephesus, but saying farewell to a delegation from that church that met him at Miletus.

At Jerusalem he presented the mother church with the great collection he had been gathering for some time and was cordially received by James and other leading members, but advised to give evidence to the Jewish Christians that he himself still followed the ancestral mode of life according to the Law (Acts xxi). Paul was willing to do this, but it brought him into conflict with certain fanatics who accused him of defiling the temple. These were not Jewish Christians, but Jews of Asia who knew of his work in Ephesus and were bitterly opposed to him. A great uproar followed in which Paul was nearly killed, and only rescued by the prompt action of the Roman captain who commanded the garrison of the castle of Antonia overlooking the temple. Paul's attempt to explain his position to the Jews only enraged them the more and soon after, convinced that plots were being laid against Paul, Lysias the Roman captain sent him under a strong guard to Felix, the governor of Palestine at Cæsarea. Although Felix soon discovered that Paul was not guilty of any serious offense, he kept him bound in easy confinement, partly from mercenary motives, until his recall about two years later (that is, about 57 A.D.). Felix was succeeded by Porcius Festus before whom Paul cut the whole matter short by appealing to the emperor (Acts xxv-xxvi).

Paul was sent to Rome at the first opportunity (57 A.D.). With other prisoners he experienced shipwreck near Malta and was compelled to remain there all winter. In the spring the voyage was resumed and in due time they arrived at Rome. Paul's resolution and courage had commended him to the centurion in charge during

the voyage, and he was in consequence treated leniently. Friends met them some miles outside of Rome. In the city, while awaiting the emperor's pleasure concerning his case, Paul was permitted to live in his own hired lodging and have free intercourse with any who might desire to see him. One of his first acts in Rome was to call the leading Jews of the city together and set before them the principles of Christianity. The result was, as usual, that some believed him; others did not. Luke says (Acts xxviii, 30-31) that this Roman captivity lasted two years (58-60 A.D.). If it had ended with his execution it would probably have been so stated. The natural inference is that he was released at the end of that period. It was during his Roman imprisonment that he wrote the 'Epistles of the Captivity,' that is Ephesians, Colossians, Philemon and, probably as the last, Philippians. In these epistles the controversies that raged in Asia and filled his mind when writing to the Galatians and Corinthians are no longer prominent. His mind is full of the thought of the Church of Christ, and of the great divine personality who is its head. It is in these beautiful epistles, especially in Philemon and Philippians, that the heart of Paul is seen as nowhere else except perhaps in 2 Corinthians. Some details as to Paul's experience in Rome may be gathered from Philemon and Philippians, not sufficient, however, to make a complete outline.

After his release (61 A.D.) Paul appears to have undertaken another missionary journey, possibly to Spain (Rom. xv, 24, also the tradition in Clem. Rom.). He afterward revisited the East and while there (according to what seems the most probable theory) wrote 1 Timothy and Titus. Again arrested he was brought to Rome for a second trial. Before this took place he wrote a letter to Timothy (2 Timothy) beseeching him to come to him as soon as possible. It was probably about 64 or 65 that the great Apostle was executed by command of Nero. (The points in this paragraph have been stated on the theory that the Pastoral Epistles are genuine Pauline letters).

It is hard to estimate adequately the significance of such a life. More than any other one Paul made Christianity the world-religion. No other man has so profoundly influenced the religious thinking of mankind. He was the greatest man of the Apostolic Age, if not of all ages of the Church. Yet he was ever the disciple and Jesus the Master.

EDWARD E. NOURSE,

Professor Biblical Theology, Hartford Theological Seminary.

SAINT PAUL, a remarkable island in the Indian Ocean, half way between Africa and Australia, and about 50 miles south of the island of Amsterdam. These islands are the exact antithesis of each other, Saint Paul almost barren and Amsterdam covered with a dense vegetation. The island is two miles long, the highest point about 860 feet high and of volcanic origin. Goats, cats, rats and mice flourish, insect life is abundant and sea-fowl in multitudes are characteristic. Fisheries are excellent. Saint Paul was ceded by England to France in 1892.

SAINT PAUL, Minn., the capital of the State, is situated on the Mississippi River, which, flowing for six miles northeastward from Fort Snelling on the Minnesota, and then bending southward, forms a letter S at this point. The greater part of the city is on the north bank of the river and is contiguous with Minneapolis on the west. The banks of the Mississippi at Saint Paul are from 100 to 200 feet high, in three terraces. The first of these is largely occupied by railroad yards, the second by the business section and the third and highest by residences. The picturesqueness of the river scenery has enabled the city, in collaboration with Minneapolis, to achieve wonderful effects in parking and boulevarding. The Indian mounds, on the steep bluff that overlooks the river as it makes the southward turn of the S, have long been famous. Adjacent are the grounds of the Minnesota Fish Hatchery. Besides this river scenery the city possesses several lakes, two of which, Como and Phalen,

Copyright by Blank, McNally & Co.

are appropriately parked and connected by a boulevard that continues on to the Minnesota State Fair Grounds in the northwestern part of the city. Altogether, the parks, playgrounds and drives of Saint Paul comprise over 2,000 acres; and in addition there are fine roads connecting the city with many fine lakes in its immediate vicinity. The largest of these is White Bear, 12 miles from the centre of the city. The opportunity thus provided for recreation, in both summer and winter, has been a chief contributor to the unusual health of Saint Paul; and another cause is the pure drinking water that the city procures from these outside lakes. The death rate is but nine per thousand. The mean summer temperature is 67; the mean winter temperature 8.4. The elevation above sea-level is 683 feet.

Buildings.—Within the past decade Saint Paul has been enriched by the erection of many fine buildings. Of these the most worthy of notice are the Public Library, a memorial to the late James J. Hill, the Railway Exchange, the largest railroad office building in the world, the Capitol and Merchants' national banks, the Saint Paul Hotel and the Catholic cathedral, which occupies a commanding site near the centre of the city. On another hill not far distant is the Minnesota Capitol, completed in 1905 at a cost of \$4,000,000 and containing mural decorations by leading American artists, and the Minnesota Historical Library. Within easy walking distance of one another in the retail district are the Auditorium, which seats 10,000, post office, city hall, the stately old capitol, Lowry building, Manhattan block, Pioneer building and the Y.M.C.A. building. On the fair grounds are the grand stand, with a seating capacity of 25,000, livestock pavilion, used in the winter as a skating-rink, horticultural hall and several other structures of importance. A union passenger station costing \$15,000,000 has recently been erected on the river front.

Public Works.—Saint Paul has 830 miles of streets, of which 90 miles are paved and 50 macadamized, 425 miles of sewers, 430 miles of water-mains, 400 miles of gas-mains and 170 miles of street railway track. Four routes connect the city with Minneapolis. The city is well lighted, having 1,200 incandescent cluster lamps, 5,000 gas incandescent and 2,700 nitrogen-filled lamps.

Commerce and Industry.—Saint Paul is the United States internal revenue collecting point for the Northwest and the United States army headquarters for the same territory. The meat-packing trade of the Northwest is strongly centred here, producing an annual value of \$50,000,000; but with improvements being made an increase to \$200,000,000 is imminent. The largest individual horse market in the United States is at Saint Paul. The manufacture of shoes, grass carpets, refrigerators, machinery, soft drinks, fur goods and law books employs a capital of \$98,000,000 and produces annually \$125,000,000, employing 23,000 persons.

Wholesale and Jobbing Trade.—Saint Paul, by virtue of its position at the head of navigation and as the capital city of Minnesota, early won precedence in the wholesale trade, and now contains some of the largest houses

in the United States. In 1918 this trade amounted to \$500,000,000.

Transportation.—As the head of navigation on the Mississippi the city has enjoyed enviable advantages in transportation. Until the coming of the railroads these advantages made Saint Paul the first city in the Northwest, and the railroads naturally made headquarters here. River traffic has declined, but the completion of the government dam at Minnehaha promises to revive it through the use of barges towed by launches and the city has prepared itself to take advantage of the new opportunity. Excursion boats carried 50,000 persons during 1918. The Great Northern, Northern Pacific, and Chicago, Saint Paul, Minneapolis and Omaha have main offices and shops at Saint Paul. In addition to these lines the Rock Island, Burlington, Great Western, Chicago, Milwaukee and Saint Paul and the Minneapolis and Saint Louis meet at the Union Station and at the Minnesota Transfer in the western end of the city. Freight cars to the number of 353,640 are handled annually. Besides the four traction routes connecting the city with Minneapolis, three rural trolley lines serve gardeners south and east of the city. Saint Paul, in close connection with Minneapolis, is the hub of a wheel-like system of railroads radiating in every direction and giving the city service to Chicago, Iowa, the Dakotas, Winnipeg, Duluth and Wisconsin points. Three routes are transcontinental.

Finance and Banking.—The bonded debt of Saint Paul is (1919) \$8,360,000; the sinking fund is \$220,983. The city has an assessed valuation of \$467,670,129, of which \$309,254,789 is real estate valuation and the remainder personal property and money and credits. The tax rate is 42 mills. This is levied, according to State law, on a 25 per cent personal valuation, a 40 per cent real estate and 100 per cent money and credits valuation. On this basis the resources of the city for 1919 were \$7,402,140. Of this sum \$180,000 was spent for improvements, \$456,000 for police, \$755,000 for fire, \$1,535,170 for schools, \$182,000 for library, \$161,000 for parks, \$1,250,000 for water and lighting. On 1 Jan. 1919 there was a balance on hand of \$20,000. The city has 26 banks, capitalized at \$16,000,000. They hold deposits of \$133,489,000. Their clearings in 1918 were \$1,057,199,127.

Education.—The public school system enjoys the advantage of being closely connected with the library, the same commissioner administering both. There are 60 buildings including four high schools, one of which is the Mechanics Arts. A teachers' training school is part of the system. There are 1,014 teachers and 30,000 pupils. Attending various parochial and private schools are 15,000 pupils. Saint Paul is easily accessible from the university, the grounds of which extend almost to the western limits of the city, and to the School of Agriculture and experimental farm adjacent to the Minnesota Fair Grounds in the northwestern part of the city. Within the city are Hamline University (Methodist), Macalester College (Presbyterian), Saint Thomas College and Saint Paul Seminary (Catholic), Concordia College (German Lutheran), two Lutheran seminaries and Saint Paul College of Law. In the

suburb of Saint Paul Park is Saint Paul College (German Methodist). Attending these institutions of higher learning are 4,000 students. In addition to them there are six business schools and 10 schools of music. The Saint Paul Institute conducts evening classes and lecture courses.

Libraries.—The main public library is housed in the beautiful Hill Memorial Library finished in 1917 at a cost of \$1,000,000. It conducts three branches. In 1918 955,585 volumes were circulated. The city owns 210,000 volumes. Besides the public library students in Saint Paul have the advantage of the State Law Library of 75,000 volumes, the Minnesota Historical Library of 115,000 volumes and a complete file of Minnesota newspapers, the Carnegie Library at Hamline University, those of the other colleges, and the Ramsey County Medical Library.

Churches and Charities.—Saint Paul has been the home of the Catholic archbishop of the province of Minnesota since pioneer days. Besides the cathedral there are 25 churches of this faith. There are also 15 Episcopal, 24 Methodist, 18 Presbyterian, 18 Baptist, 12 Congregational, 6 Christian Scientist, 41 Lutheran, 10 Jewish and 39 of other denominations. The Wilder Charity, on a foundation of \$2,778,000 of invested funds, is the chief instrument of remedial work in the city. Closely connected are the Wilder Baths. In addition there are 12 hospitals, two childrens' homes and other institutions ministering to the unfortunate.

Government.—Saint Paul is governed by a council of seven commissioners including the mayor, each of whom is elected, and then appointed by the mayor to the responsibility of administering a department of government. These departments are: Finance, public works, public safety, including bureaus of health, fire and police; parks, playgrounds and public buildings; public utilities, including bureaus of water, lighting, markets and control of utilities; and education, including the management of the library and auditorium. The commissioner of education chooses the superintendent of schools. The commissioners, sitting as a council, choose a clerk and corporation counsel. The mayor appoints the purchasing agent. Under this system the legislative and executive functions of government are united; but the judicial department is free from council control. The people have also reserved the right to elect the city comptroller. City elections occur on the first Tuesday in May in alternate years when the seven commissioners, comptroller, three justices of the peace, two municipal judges and four constables are chosen.

History.—The first settlement on the site of Saint Paul was a group of cabins about the hut of a whisky-trader, named on account of a defect, "Pig's Eye"; surnamed, Parrant. Swiss refugees from the Lord Selkirk settlement at Pembina, who had been driven off the Fort Snelling Reservation, added to the population. In 1841 Henry Jackson built a store on the river bank near the present Union Station; and steamboats found enough business to warrant stopping on their way to Fort Snelling. But it was Father Galtier, sent to evangelize the wilderness, who gave the rough station its name by erecting a log chapel which he called Saint Paul's. This was also in 1841. During the

40's the city, by reason of its position as the practical head of navigation, took the lead over other settlements and began to develop its famous ox-cart trade in furs and buffalo-meat with the Red River Valley. Upon the formation of the Territory of Minnesota in 1849 it was the logical capital, and through years of political battle remained so. Railway communication between Saint Paul and adjacent settlements, especially Saint Anthony (Minneapolis), Stillwater, on the Saint Croix, and points on the Minnesota River and the lower Mississippi were contemplated in the late 50's, after the first rush of immigrants to Minnesota; but the companies that were to construct the roads under pressure of financial panic, defaulted, so that it was 1862 before the first railroad train made its way from Saint Paul to Minneapolis; but during the next decade many thousands of miles were built in all directions from the capital which, to its great river business, now added the advantage of a rail centre. Its chief figure in the development of this business was James J. Hill, who, by reorganizing the Saint Paul, Minneapolis and Manitoba into the Great Northern and making it a pioneer into northern and western Minnesota, and later a transcontinental railroad, added immensely to the prestige of his city. In the late 80's an unfortunate speculative excitement which inflated property values and wasted the resources of the city in improvements far in advance of its needs, besides expanding the boundaries beyond reasonable limits, received the approval of almost the entire city. The result was a depression that retarded the growth of the city for several years—until the beginning of the new century. Since 1900, however, Saint Paul has enjoyed a constant and consistent development in industry, commerce, education and the higher life, as expressed in music, art and religion. Without increasing its area it has more than doubled its population during the past 20 years; and has expended its chief efforts to maintain and augment the natural beauty of its surroundings and to safeguard the health and insure the culture of its people rather than to exploit its real estate.

Population.—In 1850 there were in Saint Paul 1,112 souls; in 1880, 41,473; in 1890, 214,744; in 1919 (City Directory estimate), 300,000. Of these 25 per cent are of foreign birth, 45 per cent of foreign parentage. Of the foreigners 30 per cent are Scandinavians, 24 per cent Germans, 23 per cent Russians and Austro-Hungarians, 19 per cent English, Scotch and Irish (8 per cent of the last), and the remainder chiefly French and Italians with a sprinkling of Dutch, Belgians, Greeks and Turks.

F., 'History of Saint Paul'; Andrews, 'History of Saint Paul' (1890); Folwell, 'Minnesota' (1910); Parsons, 'The Story of Minnesota' (1916); Pollock, 'Our Minnesota' (1917); Carney, 'The Story of Minnesota' (1917); Pamphlets of the Saint Paul Association and Reports of city departments.

E. DUDLEY PARSONS,

Author of 'The Story of Minnesota.'

SAINT PAUL DE LOANDA, lô-ân'da, Angola or Portuguese Southwest Africa, a city, seaport, bishop's see, the principal Portuguese settlement on that coast, and capital of the

colony of Angola, on the south side of Bengo Bay, at the mouth of the river of the same name. The climate is comparatively healthful, the harbor is large, attractive and provided with three defensive works, and the city is built on sloping ground, on the heights of which are the principal residences, a railway line extends from Loanda to Lucalla (226 miles) and thence to Malanje (149 miles), with which it is intended to join the Central African Railway. In 1914 there entered the port 195 vessels of 293,531 tons, and cleared 187 vessels of 270,917 tons. The carrying trade with Europe was conducted by one Portuguese, three British and one German steamship line, the exports comprising ivory, coffee, rubber, hides, palm oil and beeswax. Loanda was formerly the center of an extensive slave trade, and in the 17th century was noted for its fine churches and monasteries, now mostly in ruins. Pop. 17,541.

SAINT PAUL SEMINARY, The, a Roman Catholic theological institution founded at Saint Paul, Minn., in 1890. Buildings, and an endowment, all totaling \$500,000, were given by James J. Hill (q.v.); and the institution became the provincial seminary of the ecclesiastical province of Saint Paul. The seminary was opened in 1894. Archbishop Dowling is president of the board of trustees. The seminary has courses in theology and in philosophy; and three departments of instruction, theology, philosophy, and arts; the courses in the department of philosophy include mental philosophy, psychology, history of philosophy and biology; the courses in the department of arts include Hebrew, Greek, Latin, modern languages, and music, and form a part of the philosophical course; the study of Hebrew, is optional. The seminary has a campus of 40 acres, the land sloping gradually toward the Mississippi; the buildings include the administration building, the class building, three residence halls, a dinner-hall, a gymnasium and the chapel. In 1919 the library contained over 25,000 volumes, the students numbered 213 and the faculty 12.

SAINT PAUL'S CATHEDRAL. See LONDON.

SAINT PAUL'S SCHOOL, a noted college preparatory school at Concord, N. H., founded in 1855 by Dr. George Cheyne Shattuck and incorporated on 29 June of the same year. It was opened on 3 April 1856, its first rector being Rev. Henry Augustus Coit who held that position till his death in 1895. By the terms of the founder's deed the trustees of the school must be communicants of the Protestant Episcopal Church. The course of instruction covers six years and the school is divided into six forms and an upper remove. In 1916-17 there were 47 masters and 360 students. The buildings, some 60 in all, are situated in a pleasant rural locality rather more than two miles from the city of Concord, the most important of these, architecturally, being the library, the imposing Upper School (built in 1903) and the spacious chapel, the latter containing a superb oaken reredos and a recumbent marble statue of the first rector of the school. The grounds belonging to the institution comprise about 2,000 acres. Rowing and cricket are the favorite sports of this school. The library contains 13,000 volumes and there are two literary so-

cieties, the Cadmean and the Concordian. There are 12 scholarships offered. The school journal, 'Hortæ Scholasticæ,' was founded in 1860 and is issued monthly. Consult Adams, 'Some Famous Schools' (1903).

SAINT PAUL'S SCHOOL, London, England, an endowed grammar school, founded by John Colet in 1512, with no limitations as to country, nation or class. It was built to accommodate 153 students and until 1884 stood in Saint Paul's churchyard. It was instituted for the free education of poor children. The original building was burned down in 1666. In 1824, the second one, built by Wren, was taken down and another erected. In 1884 a new school was opened at West Kensington. The course of study was formerly classical, but is now designed to prepare for army examinations. It is interesting to note that Major André, Camden, Halley, Milton, Pepys, Judge Jeffreys, the Duke of Marlborough and Sir Philip Francis were students here.

SAINT PETER, one of the twelve apostles of Jesus Christ. Peter (from the Greek *πέτρος* a rock, of which the Aramaic equivalent was Cephas) was the son of a certain John or Jonah (cf. John i, 43; Matt. xvi, 17). He was born at Bethsaida of Galilee (John i, 44; xii, 21) but afterward resided at Capernaum where he had a house and was engaged in the fishing business in partnership with his brother Andrew, and with Zebedee and his sons James and John. (Mark i, 16-20; Luke v, 10-11). His proper name was Simon or Simeon, but the surname Cephas given him by Jesus (John i, 43; cf. Matt. xvi, 18) became, in its Greek form, Peter, the name he was generally known by in the early Church.

Since the firm to which Peter belonged owned boats and nets and hired assistants it is needless to think of Peter as poverty stricken, though it is not probable that he was wealthy.

Of his education we know practically nothing. It is likely that he spoke ordinary business Greek as well as his native Aramaic, for Galilee was largely bi-lingual. He may have been able to read the Old Testament in Hebrew. However, he was not "learned" in the rabbinical sense (Acts iv, 13). He was probably familiar with the Greek Old Testament, but knew but little of the Jewish scholarship of the day.

When John the Baptist appeared in the lower Jordan Valley with his announcement of the coming crisis, Peter and his business partners were among the many Galileans who went to hear the great preacher. Here he became acquainted with Jesus (John i, 40). This first acquaintance did not immediately result in full discipleship, since Jesus had not yet opened His public ministry. It is uncertain to what extent Peter accompanied Jesus before he was formally called when Jesus opened his Galilean ministry (Mark i, 16). Yet it was the earlier acquaintance with Jesus that prepared the way for the summons to a life-work (Mark i, 16; Luke v, 11), when at Jesus' word Simon left his nets and boats and became one of the daily companions of the Great Teacher. As yet, however, he was only one among many whom Jesus attracted to Himself during the early months of His work in Galilee. It was a testing time for Simon. He showed such appreciation of Jesus' person and teaching that he was chosen by Jesus to be one of 12, selected

from the larger body of "disciples" who were to be "apostles," that is, intimately associated with Him to learn of Him and (ultimately) be sent out by Him to declare His message and carry on His work (Mark iii, 14). With the brothers James and John he made a group of three with whom Jesus was most intimate and who alone were associated with Him on such occasions as the transfiguration and the prayer in the garden of Gethsemane. To Peter and his companions Jesus' refusal to allow the enthusiastic crowds, after the feeding of the 5,000 (Mark vi, 31-44; John vi, 14-15) to proclaim Him as Messiah must have been a great disappointment. But the Twelve remained steadfast and it was Peter who voiced their conviction a little later, in response to Jesus' searching question, that Jesus was indeed the Messiah (Mark viii, 29ff.; John vi, 68). According to Matthew (xvi, 18) this confession drew from Jesus the commendation "thou art Peter (that is, rock) and on this 'rock' I will build my church." The explanation of these words granting their genuineness has been a subject of much dispute. Roman Catholics hold that by them Christ conferred a personal supremacy over the Church upon Peter. Protestants deny this, and regard them merely as referring to the truth Peter uttered as the foundation of His Church. When Jesus soon after declared that it was necessary for Him to go to Jerusalem and suffer, Peter protested and was rebuked. The transfiguration scene opened his eyes more fully to the significance of Jesus' person. Thus his education proceeded, new lessons being learned daily. He was, of course, present during the experiences of Passion Week. He and John were sent into the city to prepare the Passover meal which became the Lord's Supper. He witnessed the agony in the garden. When the band arrested Jesus, Peter drew his sword and struck off the ear of one Malchus. Later, through the influence of John, he gained admission into the palace where Jesus' trial was proceeding. Here through cowardice he denied with an oath that he knew Jesus and then overcome by shame went outside and wept. He was a witness of Jesus' sufferings on the cross if not of His trial before Pilate. These scenes were so indelibly stamped on his mind that years after they retained their impression and shaped his thinking (1 Peter ii, 23; v, 1). The despair that settled over his soul when he saw his beloved Master die was not lighted by any definite hope of a resurrection. But when the women who were at the sepulchre early Sunday morning came with the news of an open and empty tomb, Peter with John ran to investigate. They found the tomb empty and returned to their company. Peter was the first of the Twelve to whom Jesus showed Himself after His passion (Mark xvi, 1-8; Luke xxiv, 35; John xx, 1-10; 1 Cor. xv, 5). For Peter this was a new birth, filled with a living hope (1 Peter i, 3). Later Jesus restored Peter to his full apostolic position (John xxi).

Peter now took a leading part in the direction of the little band of disciples that was the nucleus of the Christian Church. He proposed the election of a successor to Judas Iscariot (Acts i, 15ff.) and on the day of Pentecost made the first statement of Christian doctrine to the world. The sermon as given in Acts ii, 14-36 centres about the necessity of

proving to the Jews that the crucified but now risen Jesus was indeed God's Messiah. The argument from the analogy between ancient prophecy and the recent events connected with Jesus was a convincing one to many Jews and large numbers confessed their faith in Jesus as Messiah. Until the persecution because of Stephen the new movement was confined almost exclusively to Jerusalem and it was Peter who had the chief share in the guidance of affairs. His associate was John. These two figure prominently in the accounts of the first conflicts with the Jerusalem authorities (Acts iii-iv). It was Peter who rebuked Ananias and Sapphira for their covetousness (Acts v, 1-11), who was spokesman for the apostles in their formal trial before the Sanhedrim (Acts v, 17-42), and whose fame was such that later tradition said that even his shadow was able to perform miracles (Acts v, 12-16). After the martyrdom of Stephen the Christian movement took on larger proportions. The work spread throughout Palestine and into neighboring countries. To a certain extent it was supervised by the apostles. Acts records two visitations by Peter in this connection. The first was when he and John were sent by the apostles to oversee the evangelistic labors of Philip in Samaria. Here Peter came in contact with the magician Simon, severely rebuking his cupidity and lack of spiritual perception (Acts viii, 14-25). The second tour was an extensive one in the regions of the northwest of Jerusalem (Acts ix, 32ff.). On it he healed Eneas at Lydda and raised Tabitha at Joppa. From Joppa he was summoned to preach the gospel to Cornelius, a Roman centurion stationed at Caesarea (Acts x). This was the first recorded preaching of the gospel by Jewish Christians to Gentiles. In this matter Peter unexpectedly found himself doing what he had never done before, fellowshiping freely with Gentiles, recognizing them as Christian brethren and eating with them.

Naturally such conduct provoked sharp criticism on the part of the stricter members of the Jerusalem Church. Peter's defense was that he had been guided by the Holy Spirit and that the Spirit's presence had been manifested while he was preaching to the Gentiles (Acts xi). Sometime after this Peter was arrested by order of Herod Agrippa I, and imprisoned in Jerusalem with a view to executing him on the following day. But he escaped and left Jerusalem immediately (Acts xii, 1-17). Whither he went is not said and for all further knowledge of Peter's movements we must trust to incidental statements in the New Testament or to the very uncertain notices in early Christian literature. Since Herod Agrippa died in 44 A.D. the events narrated in Acts i-xii, in case they are arranged in chronological sequence, must have covered a period of about 15 years. We may say then that for that length of time Peter was the foremost figure of the early Apostolic Church. During this period, three years after his conversion, Paul visited Jerusalem to talk matters over with Peter (Gal. i, 18), staying with him 15 days. This must have been somewhere near 40 A.D. His subsequent career was, doubtless, just as important, but its details have not been preserved. About 49 A.D. Peter was present at the council in Jerusalem and took a leading part (Acts xv, 6 ff.; Gal. ii,

1-10). By this time he had become recognized as the "Apostle of the Circumcision" (Gal. ii, 7), through whom God was working as effectually as He was through Paul for the "Uncircumcision" (that is, the Gentile world). These expressions of Paul seem to indicate that Peter's activity was—like his own—largely missionary in character, to the Jews of the dispersion, as his was to the Gentiles. For this reason Peter was in Jerusalem only occasionally after his escape from Herod Agrippa in 44 A.D. We learn further, from Gal. ii, 11-14, that at Antioch, either soon after the council of 49, before Paul set out on his second missionary journey (49-52 A.D.), or at the close of that journey when Paul was at Antioch for a while (Acts xviii, 23), Peter was sharply rebuked by Paul for weakly yielding to emissaries of the strict Judaistic party of Jerusalem and withdrawing from familiar fellowship with the uncircumcised Gentile members of the Church. It is of interest to note that Paul's own words in Galatians imply that Peter, Barnabas and others had been in the habit of thus freely mingling with Gentile Christians, which is only what we would infer from Acts x-xi. Full fellowship with the Gentile converts was not discussed at the Council of 49, and Peter's withdrawal did not violate the terms of the agreement reached in the council. It violated the principles there followed, however, and deserved Paul's rebuke.

For the remainder of Peter's career we are in almost total ignorance. He appears to have continued his missionary labors. In these he was frequently accompanied by his wife (1 Cor. ix, 5). Early Christians looked back to him as the first bishop of the Church of Antioch. Whatever truth there may be in this tradition it is certain that he did not organize that great Church. Other ancient traditions speak of his labors in Asia Minor, especially in the regions near the Black Sea. These may be no more than inferences based on the address of the First Epistle. At what point in this later period are we to place the two epistles attributed to him? The authenticity of the first is more certain than that of the second. It was written from "Babylon" to the "dispersion" of northern Asia Minor. Both terms have been taken in a figurative sense and most scholars hold that it was written from Rome to Gentile Christians in Asia Minor. Neither of these positions rests on any very substantial evidence, though it is just more than possible that the letter was sent from Rome. Mark was with the apostle at the time, also Silvanus, who appears to have penned the epistle (v, 12-13). Since Silvanus was Paul's companion as late as when he wrote 2 Cor. (i, 19) Peter's letter must be dated after 55 A.D. And since Paul's later letters from Rome, Philippians, Colossians, Ephesians and Philemon (58-60 A.D.) betray no evidence of personal contact with Peter in Rome, the probability is that Peter was in Rome between 55 and 58, and thence sent his message to the churches of Asia Minor; not to the Pauline churches there, but to other communities that were less directly connected with Paul's work. To what place Peter went after leaving Rome, whence he sent the second letter, in case it is his, and whether he returned to Rome—all these are matters

on which we possess no direct information. According to a widespread tradition, which has become generally accepted in Christendom, Peter suffered martyrdom at Rome. It must be admitted, however, that the direct evidence for this tradition cannot be traced much farther back than 180 A.D. At that time it was the firm belief of the Roman Church that both Peter and Paul were martyred at Rome and that the places of their martyrdom (or burial) could be pointed out. The same tradition thought of them as the founders of the Roman Church. All that can be said is that there is no sufficient ground for rejecting the kernel of the tradition, that is, that Peter was at Rome for a longer or shorter period and probably suffered martyrdom at that city. The Roman Catholic Church accounts Peter as the first Bishop of Rome and the first Pope.

EDWARD E. NOURSE,
*Professor of Biblical Theology, Hartford
Theological Seminary.*

SAINT PETER, Minn., city and county-seat of Nicollet County, on the Minnesota River, and on the Chicago, Northwestern, and the Chicago, Saint Paul, Minneapolis and Omaha railroads, about 73 miles southwest of Saint Paul. It was settled in 1854 by Capt. W. B. Dodd; incorporated in 1865, and chartered as a city in 1873. It is in a farming and dairying region and in the vicinity are limestone quarries. The chief industrial plants are flour mills, machine shops, shirt and trouser factories, grain elevators, limestone quarries, iron foundries, creamery, etc. The State Hospital for the Insane, located here, accommodates about 1,200 patients. The educational institutions are the Gustavus Adolphus College, co-educational (Lutheran), about 375 students; public and parish schools, a Carnegie Library and an armory. The city has a national bank (1917) with capital \$50,000 and resources \$565,139. The government is vested in a mayor and a board of aldermen elected annually. The city owns and operates the waterworks and electric light plant, being the first city in the State to own such public utilities. Pop. 4,176.

SAINT PETER PORT, Channel Islands, capital of the Island of Guernsey, on the east coast, rises in terraces on the slope of a hill,

and presents a very attractive appearance from the sea. The streets are narrow and steep; the environs exceedingly beautiful, studded with handsome residences. The most interesting buildings are Saint Peter's cathedral-like church, a Gothic structure of the 14th century, Elizabeth College (1563), Ladies' College, public hospital, Hauteville House, where Victor Hugo lived in exile, 1856-70, and the handsome market. The Guille-Alles Library, founded by two New York merchants, natives of Guernsey, in 1882, contains 80,000 volumes. The Royal Court-House is used both as court of justice and as parliament house. The harbor is large and commodious, and is defended by the picturesque mediæval Castle Cornet on a rocky islet at its mouth and by Fort George, a modern fortification on the heights, about one half mile south from the town. Pop. about 20,000.

SAINT PETER'S, ROME. See **ROME**.

SAINT PETER'S CANAL. See **CANADIAN CANALS**.

SAINT PETER'S COLLEGE, or **PETERHOUSE**, England, is the oldest college in the University of Cambridge. It was founded as a hospital and converted into a college in 1257. This and the other sister colleges were modeled after the monasteries, to a certain extent. The present chapel was opened in 1632. The hall and combination rooms have been restored. The poet Gray belonged to this college; also Isaac Barrow, Archbishop Whitgift and Sir William Thomson. In 1916 there were 211 members of the senate; statistics of teachers and students not given because of the war drain.

SAINT PETER'S LAKE, Quebec, Canada, an expansion of the Saint Lawrence River, between the mouths of the Saint Maurice and the Richelieu, and extending nearly to Three Rivers. It forms the outlet of many rivers, chief of which is the Saint Francis. In its southern portion are found many islands, notable for their fine scenery. The length of the lake is 35 miles; the breadth, 10 miles.

SAINT PETERSBURG, Russia. See **PETROGRAD**.

SAINT PETERSBURG, Fla., city in Pinellas County, on Tampa Bay, and on the peninsula separating the bay from the Gulf of Mexico, on the Atlantic Coast Line and the Tampa and Gulf Coast Railroad. It is popular as a winter resort, has a beautiful beach, an excellent harbor, and is a shipping point for saltwater fish. Pop. 4,127.

SAINT PETERSBURG, Declaration of, an agreement between the European powers made in December 1868 at Saint Petersburg; signed by representatives of Austria, Belgium, Bavaria, Denmark, France, Great Britain, Italy, the Netherlands, Persia, Portugal, Germany, Russia, Sweden, Norway, Switzerland, Turkey and Württemberg. The powers agreed to use in war no explosive projectile of less weight than 400 grams, or 14 ounces avoirdupois. Other provisions were made to reduce the death rate and alleviate the suffering of injured and disabled soldiers by the use of more humane implements of war; practically all of the agreements were discarded by the Teutonic allies in the great World War.

SAINT PHILIP. See **FOGO**.

SAINT PHILIP, Fort. See **FORT JACKSON** AND **FORT SAINT PHILIP**.

SAINT-PIERRE, Jacques Henri Bernardine de, zhāk ōn-rē bār-nār-dēn de sǎh pē-ār, French author: b. Havre, 19 Jan. 1737; d. Eragny sur-Oise, 21 Jan. 1814. He received his education at Caen and at Rouen, and entered the government service as a civil engineer. Dismissed for insubordination in 1761, he wandered about the Continent for several years before he began to write, endeavoring to realize a dream of a republican colony. He returned to France in 1766, and soon obtained a commission as engineer for the Mauritius, but after three years on the island he returned to Paris. His first book, 'Voyage à l'île de France' (1773), an account of his voyage to the island of Mauritius, did not attract attention. Sixteen years later his experiences in this lonely island became the background of his celebrated novel, 'Paul and Virginia,' which was published in Paris in 1788, and almost immediately translated into English, Russian, Polish, Dutch, Spanish and Italian. He was the author of two other novels little known beyond his day, and of two volumes of poetical studies of nature: 'Etudes de la nature' (1784); and 'Harmonies de la nature' (1796); He was admitted to the Institute in 1795. His works besides those already mentioned are 'Essai sur Jean Jacques Rousseau'; 'La chaumière indienne' (1790); 'Le café de Surate' (1790); and his 'Correspondance' (1826). (See **PAUL ET VIRGINIE**). Consult Barine, 'Les grands écrivains français' (1891); Maury, 'Etude sur la vie et les œuvres de Bernardin de Saint Pierre' (1892).

SAINT-PIERRE, Jacques Legardeur de, zhāk lā-gār-dēr dē, French soldier: b. Normandy, 1698; d. near Lake George, N. Y., 1755. He entered the army in early youth and went to Canada where he served against the Iroquois and against the English in the War of 1740. He was one of the first to explore the Rocky Mountains, making the journey up the Saskatchewan River in 1752, and on his return was ordered to Fort de Bœuf, Ohio. While in command there he received George Washington, then adjutant-general of Virginia, who brought a letter from Governor Dinwiddie requesting the withdrawal of French troops from English territory. Washington in his journal comments very favorably on the French commander. Saint-Pierre was succeeded by Contrecoeur in 1753 and was appointed to the command of the Indian auxiliaries. He rendered valuable services in Baron Dieskau's expedition and was afterward killed in the action near Lake George, where Whiting's regiment was routed. His account of the Rocky Mountain expedition is preserved in the National Library of Paris, and was published in the collection of John Gilmary Shea, 'Mémoire on journal sommaire de Jacques Legardeur de Saint Pierre' (1862).

SAINT PIERRE, a town on the island of Réunion, in the Indian Ocean, on the west coast, 34 miles south of Saint Denis, the capital and the terminus of a railway 83 miles long, connecting with the capital, with Pointe-des-Galets, the chief port, and with Saint Benoit on the east coast. Pop. 29,481. See **RÉUNION**.

SAINT PIERRE, West Indies, a former chief town in the volcanic island of Martinique (q.v.). Prior to the eruption in 1902 of Mont Peleé, Saint Pierre was the largest and most flourishing city not only of Martinique but of the Lesser Antilles, with a population of 26,000. It was an important seaport and a bishop's see. The principal buildings were the cathedral, lyceum and palace of justice. There was a fine botanical garden containing rare and peculiar specimens, etc.—all destroyed by the sudden catastrophe above noted, together with the entire population.

SAINT PIERRE AND MIQUELON, mēk-lōn. The small colony of Saint Pierre and Miquelon is doubly interesting for France inasmuch as it is the only one of the French settlements which is situated outside the tropical zone, and is furthermore the last link which exists of France's one-time Canadian empire. The colony, moreover, despite its small area, has been prosperous for a number of years, thanks to its fishing industry, but this latter has recently declined a little. The three islands of Saint Pierre, of Greater and Smaller Miquelon, have an area of 241 square kilometers (93 square miles) and a population of about 7,000. The islands are situated on the Atlantic Ocean, 15 to 30 miles from the southern coast of Newfoundland and about 3,700 kilometers (2,298 miles) from the port of Brest.

The form of Saint Pierre is most irregular: high and rocky from the cape of Aigle, running in an eastern, northern and western direction as far as Cape Savoird; becoming inflected toward the country dominated by Mount Galadry. The island of Miquelon is divided into two parts: Greater Miquelon and Smaller Miquelon, the latter commonly called Langlade. Smaller Miquelon is separated from Saint Pierre by a stretch of sea about a league wide which is highly dangerous to navigation. Saint Pierre is the only part in the entire colony which possesses a harbor capable of anchoring large vessels arriving from Europe or America.

There are six islets dependent on Saint Pierre, Greater and Smaller Colombier and the four islets, Ile aux Chiens, Ile aux Vainqueurs, Ile aux Pigeons and Ile Massacre.

The climate is severe. Although Saint Pierre is situated in a more southerly latitude than Paris, winter is very cold and long; living conditions are hard and were it not for the fishing industry the country would be desolate.

Industries, etc.—Cod fishing is the only remunerative industry of the colony. This is a profitable trade for the ship-owners and makes an excellent school for sailors. The fisheries were very prosperous a few years ago, the exportation of cod amounting in 1899 to about 15,000,000 francs (\$3,000,000), but fell to 6,000,000 in 1905 (\$1,200,000), dropping still lower in subsequent years. Connected with the cod fishing industry are all the other seaport trades (carpentry, sailmaking, smithing, cooperage).

The agricultural resources of the colony are not very important. The island of Saint Pierre is really just a rock, almost devoid of fertile soil and would have been entirely unproductive if the inhabitants had not to a certain extent overcome nature. Miquelon is better suited for agricultural experiments. The average trade of

Saint Pierre and Miquelon during the five years 1911 to 1915 was 11,517,267 francs (\$2,303,453), made up of 4,331,459 francs (\$866,291) imports and 7,185,808 francs (\$1,437,161) exports.

History.—Fishing attracted Frenchmen there from the time of Henri IV. While many Normans and Saintongais settled in Canada, Bretons and Basques came to the island in 1604 to fish for cod. Expelled from Newfoundland in 1713 and Acadia in 1763, many French Canadians settled in Saint Pierre and Miquelon. However, in 1778, the English forced these emigrants, numbering some 2,000, to return to France. After the Treaty of Versailles in 1783, they returned to the two islands only to be driven out again during the Revolutionary Wars, but came back in 1816 when the colony was definitely restored to France. The Anglo-French agreement of 8 April 1904 definitely settled all differences regarding the French shore, i.e., the rights of preparing and drying the fish. By this arrangement France retained fishing rights in the territorial waters of the French shore; or in other words over a coast 18 kilometers (12 miles) in length.

SAINT QUENTIN, sǎn kōn-tǎn, France, a city in the department of Aisne, on an acclivity overlooking the Somme, about 95 miles north-east of Paris. The location of Saint Quentin is of considerable strategic importance, and it has figured conspicuously in various wars, notably in 1557, in the Franco-German War in 1870, and most severely in the great World War of 1914-18. It was the centre of some of the most ruthless acts of warfare in the Teutonic assaults and little remained after the conflict but a great ruin pile. Under the terms of the Peace Treaty of 1919 German labor and capital, as determined by the Reparation Commission, have to effect a complete restoration. Prominent among its buildings is the fine Gothic church of Saint Quentin, erected 1114-77, with a special feature of double transepts. Other buildings are the courthouse, library, theatre, hospitals and lyceum. The principal manufactures are cotton and woolen goods, tulle, embroideries, lace and guipure of several kinds; there are important foundries, machine works for various special industries, brick and tile yards, and in the vicinity, numerous sugar mills. There is an active commerce in cotton and linen yarn and in grain. Several monuments and statues commemorate the defense of the town and its native literary celebrities. Pop. about 55,600. See WAR, EUROPEAN.

SAINT RAYMOND, Canada, village in the province of Quebec, on Little River Sainte Anne, 28 miles west of the city of Quebec, and on the Quebec and Lake Saint John and the Canadian Northern Railroad. There is a Roman Catholic convent and Saint Raymond's College is located here. Pop. 1,653.

SAINT REGIS, rē'jīs, N. Y., and Canada, village, part in Franklin County, N. Y., and part in Huntington County in the province of Quebec, on the right bank of the Saint Lawrence River, at the mouth of the Saint Regis River. It was settled in 1760 by the Saint Regis tribe of the Iroquois Indians, and is inhabited solely by their descendants. Both the British and the American branches of the tribe speak the Mohawk language. The village is about five miles from a railroad station in New York State;

but it has steamboat connection with Cornwall, Ont., and in summer with all the Saint Lawrence River ports and with Hogansburg in New York, on the Saint Regis River. The village is in a fertile agricultural region; the Reservation extends along the Saint Lawrence, in both the United States and Canada, for a number of miles. Many of the Indians are engaged in farming, but the chief occupation is basket-making in which they excel. There are two churches, a Roman Catholic on the Canadian side and a Methodist on the New York side, on the boundary of the Reservation. There are five schools in New York and two in Canada. Eleazar Williams lived for some time in Saint Regis. Pop. 1,400.

SAINT REGIS INDIANS, a group of Roman Catholic Iroquois from Caughnawaga, Quebec, who during the French and Indian War were established in a village which is now the boundary between New York and Quebec. The Jesuits founded among them the mission of Saint Francis Regis, hence their present name. These Indians remained neutral during the Revolution, and their number was considerably augmented by other Iroquois early in the 19th century; but their reservation extending across the international boundary, they were divided in partisanship during the War of 1812. In 1904 the entire population was 2,634, of whom 1,426 were on the Quebec side and 1,208 on the New York side.

SAINT REMY, *sān-rè-mè*, France, in the department of Bouches-du-Rhône, near the forest of Saint Benoit, is a village 14 miles northeast of Arles. It is celebrated for its Roman antiquities, the chief of which are the triumphal arch (100 A.D.) and the monument of the Julii. The latter is attributed to the period of the early empire, and consists of a square base ornamented with military bas-reliefs, surmounted by Corinthian semi-columns connected by arches, which support a second series of 10 Corinthian columns and a dome. Two statues stand in the upper portion. In 1870, in the vicinity of Saint Remy, the Germans won a victory over the French, and in the great World War from 1914 the village and its vicinity were centres of active military operations.

SAINT RONAN'S WELL, a novel by Sir Walter Scott, published in 1823. The scene is laid about a mineral spring, a quasi watering place, called Saint Ronan's Well. The book is the only society novel attempted by Scott.

SAINT-SAENS, *sān-sōn*, **Charles Camille**, French musician: b. Paris, France, 3 Oct. 1835. He received his musical education in the Conservatory of the metropolis and in 1853 was appointed organist of the church of Saint Merri, and in 1858 of the Madeleine, where he continued till 1877. His first comic opera, 'La princesse jaune,' was produced in 1872, and 'La timbre d'argent' in 1877. 'Samson et Delilah,' a sacred drama, was produced at Weimar also in 1877, and was subsequently successfully revived at Rouen. His grand operas 'Etienne Marcel' (1879); 'Henry VIII' (1883); 'Proserpine' (1887); 'Ascanio' (1890); 'Phryné' (1893), have not maintained their early popularity to the present day. He produced 'Andromaque' (1903), and 'L'Ancêtre' (1906), and was known also as a musical critic

and author of 'Rimes familières' (1886); 'Problèmes et Mystères' (1894). He was elected member of the Academy in 1881. Although he has not attained the highest rank in opera, many of his instrumental works, which include three symphonies, four symphonic poems, two orchestral suites, several concertos for piano and orchestra and violin and orchestra and a quantity of chamber music, show consummate talent if not genius. Consult Neitzel, 'Saint-Saens' (1899); Baumann, 'L'Œuvre de Saint-Saens' (1905).

SAINT-SIMON, **Claude Henri**, *klöd ön-re sān-sē-mōn* (Eng. *sānt sī'mon*), **COMTE DE**, French socialistic reformer: b. Paris, 17 Oct. 1760; d. there, 19 May 1825. Born of a family which traced its descent to Charlemagne he conceived that his origin destined him to great achievements. At 13 he offended his father by skeptically refusing to receive his first communion. Before he was 16 he gave his servant orders to call him in the morning with the summons, "Rise, M. le Comte, you have great things to do." At 18 he entered the army and he served in the closing campaigns of the American War of Independence, distinguishing himself on the day of Cornwallis's surrender at Yorktown (17 Oct. 1781). Returning home with the order of Cincinnatus, he was captured in the naval combat in which the French were defeated by Rodney, and remained a prisoner at Jamaica till the peace of 1783. On his return he was created a Knight of Saint Louis, and appointed colonel of a regiment; but after a brief period of garrison duty at Metz, abandoned the service in order to travel. He went to Holland in 1785, and to Spain in 1787. Here he was successful in introducing diligences in Spain. On the outbreak of the Revolution of 1789 he joined himself to those who petitioned the assembly for the abolition of titles of nobility, but took no further part in the political movements of the time; being wholly absorbed in the pursuit of wealth. Speculation in the national domains created by the confiscation of the effects of the nobility and clergy afforded unlimited scope for his ambition. In this career he was joined by De Redern, whom he had known in Spain. Their speculations were at first unfortunate. Redern fled and Saint-Simon was imprisoned as a nobleman for 11 months. On his liberation he realized a considerable fortune by paying for the property he had acquired in assignats, the market value of which had fallen to six francs the thousand, while they were still received at full value in payment of the national domains. During his imprisonment he had plenty of time for reflection and the thoughts he entertained may be guessed from a vision which he had. "Charlemagne," he relates, "appeared to me and said, 'My son, your success as a philosopher will equal mine as a warrior and statesman.'" In order to fulfil the mission which he had thus received he became in his 38th year a student of science, resided opposite the Ecole Polytechnique, and subsequently the Ecole de Medecine, in order to enjoy communications with the professors, whom he invited to his table.

In 1802 and 1803 he traveled in England and Germany, without, as he says, acquiring any new experience of importance. During his stay at Geneva he produced his first work,

'Lettre d'un habitant de Genève à ses contemporains.' He proposed that the savants should be maintained at the public expense; that spiritual power should be in their hands, temporal in that of the proprietors; while the 'great chief of humanity' should be elected by the masses. Religion, he observed, was merely a human invention. Having exhausted his means he obtained the post of a clerk at the *mont de piété*. At this time he encountered Diard, whom he calls his only friend. This associate not only took on himself the charge of his maintenance, but provided means for the publication of his works.

The death of Diard in 1810 plunged him again into want; and having written two more works, 'Sur la science de l'homme' and 'Sur la gravitation universelle,' he found himself without means to publish them. Later Augustin Thierry, who became his intimate disciple, co-operated in editing his work on the 'Réorganisation de la société européenne' (1814), in which he endeavored to demonstrate the uselessness of the Congress of Vienna, and to show that a European parliament, with the right to determine differences between different nations, was the only means of preserving general peace; and for the promotion of this he advocated union between England and France. The last proposal, perhaps the most sensible he had yet made, caused him to be regarded as a madman. This was his first work which attracted general notice. Finding the difficulty of procuring the means of subsistence and of publishing his works increasing he made an unsuccessful attempt in 1823 at self-destruction, which resulted in a mutilated visage and the loss of an eye. He next produced his last work, 'Le nouveau christianisme' (1825), to which he owes his position as the founder of a sect. Christianity he now averred to be a progressive system, which had been rendered immovable by the bonds of ecclesiastical law. Taking its fundamental principle of love he held the Church to be a complete organization of society for ministering to the wants of the whole, and especially of the more numerous and poorer classes. A social hierarchy based on capacities and services, with authority to divide heritages, distribute salaries, regulate vocations and take all necessary means for making the labor of all contribute to the common good, was deduced from these premises by his disciples, among whom may be mentioned Auguste Comte, Bazard, Enfantin, Henri Fournel, Pierre Leroux, Félicien, David, Dubochet, Stéphane Morey, Olinde Rodrigues, Léon Halévy, Bailly (de Blois) and Duvergier. Saint Simon continued to the last to develop and promulgate his views in a periodical publication, *Le Producteur*.

The disciples of Saint Simon rapidly grew into a sect, and were joined by other eminent men. They attempted to idealize the life of their founder, and make it a consistent whole, dominated from the first by the idea of the mission he was to accomplish. Society was divided by the Saint Simonian doctrine into three classes, priests, savants and laborers, and was to be governed by the chiefs of the three classes. Capacity was to be the ground of distribution of functions. All property was to become on the death of the proprietor the property of the church or society. All children were

to receive a general education till their particular capacities became manifest. Saint Simonism in short was an attempt to render men benevolent by external regulations; to do the work of Christianity without its authority and without its weapons.

Bibliography.—Hubbard, 'Saint Simon, sa vie et ses travaux' (1857); 'Œuvres choisies de Saint Simon' (1859-61); joint works of Saint Simon and Enfantin (20 vols, 1865-69); Booth, 'Saint-Simon and the Saint-Simonians' (1871); Janet, 'Saint-Simon et le Saint-Simonisme' (1878); Weill, 'Un Précurseur du socialisme' (1894); Warschauer, 'Saint-Simon und der Saint-Simonismus' (1892); Weill, 'L'Ecole Saint-Simonienne' (1896); Charléty, 'Histoire du Saint-Simonisme' (1896).

SAINT SIMON, Louis de Rouvroy, Duc de, French author: b. Paris, 16 Jan. 1675; d. Laferté, 2 March 1755. He entered the army in 1693, but soon resigned because not given anticipated promotion, then was employed in several diplomatic missions, and was one of the council of regency under the Duke of Orleans, but with the accession to the regency of the Duke of Bourbon he fell into disgrace, and withdrew from public life. His memoirs, commenced in 1694, while serving in the army, and on which he labored for 60 years remained a long time in manuscript, and were afterward published in a mutilated form, with many suppressions. The first edition, in 13 volumes, appeared in 1791; an edition by Cheruel and Regnier, in 20 volumes, in 1856 et seq., and revised in 1873-77; and the first complete edition appeared in Paris in 1829-31 (in 21 vols.), entitled 'Mémoires complets et authentiques du Duc de Saint Simon sur le Siècle de Louis XIV, et la Régence, publiés pour la Première Fois sur le Manuscrit Original Entièrement Ecrit de la Main de l'Auteur, par M. le Marquis de Saint Simon.' Consult Boschet, 'Le Duc de Saint-Simon' (1874); Boislisle, new edition of the 'Mémoires' (1880); Faugère, 'Écrits inédits de S. Simon' (Vol. I, 1881); Cannan, 'The Duke of Saint-Simon' (1885).

SAINT SIMON, *saint sī'mon*, an island of Georgia, at the mouth of the Altamaha River, and separated from Jekyll Island, on the south, by Saint Simon Sound, and from Wolf Island on the north, by Altamaha Sound. It is one of a group of islands long famous for the production of sea-island cotton. In 1733 this island, together with some of the mainland adjacent, was ceded to James Oglethorpe by the Creek Indians. The settlement on the island was attacked in 1742 by a Spanish force from Saint Augustine. The soil is fertile and the vegetation luxuriant.

SAINT SOPHIA, *sō-fē'ā*, Constantinople, a renowned church and mosque, founded in 325-326 by Constantine, at the time when Byzantium became the seat of empire. Saint Sophia was enlarged, rebuilt, destroyed at various epochs, but the present structure is virtually that erected by Justinian. Over 10,000 workmen were employed seven years in its construction, and the rich materials used were taken from nearly every celebrated pagan temple in all parts of the kingdom. The building was approached by a double porch 100 feet in depth. The building formed a square of 241 feet, whose interior represented a Greek cross,

surrounded by a woman's choir or gallery, supported by magnificent ancient pillars. A series of domes rise from the centre and rest upon each other, tier upon tier. The height of the dome is 175 feet. The interior was decorated throughout with sculptured marble and fine mosaics. The sedilia of the patriarch and those of the priests were of silver gilt; the dome of the tabernacle of pure gold, surmounted by a massive gold cross studded by precious stones. The sacred vessels and other apparatus were of pure gold, the altar-cloths embroidered with gold and pearls, and the altar itself consisted of molten gold into which had been thrown pearls, sapphires, diamonds and all gems which might enhance its value to the utmost. Its weight amounted to 320,000 pounds, and its total cost was £13,000,000 or \$65,000,000. When the Turks took possession of Constantinople in 1453, they transformed Saint Sophia into a mosque, destroying or concealing the Christian fittings or emblems, by coats of plaster. The mosaic pictures were saved in this way, and when Sultan Abdul Medjid ordered a complete restoration of the building, the original mosaics of Justinian were discovered. With the sultan's consent, the king of Prussia sent German artists to make accurate copies of these interesting antiquities, which were published by M. Salzenburg, the artist, at the expense of the Prussian government. The interior is at present restored for Mohammedan worship, and all Christian decorations, especially those representing the human figure, strictly forbidden by the Koran, are hidden from view under a white coating in which mosaics are imitated. Like all mosques, Saint Sophia is closed to all Christian visitors except by special permission, which is easily obtained by the hotel proprietors. Consult Von Hammer, 'Constantinopolis und der Bosphorus' (2 vols., 1822); Salzenburg, 'Alt christliche Baudenkmale Konstantinopels' (Berlin 1854); Hughes, 'Aya Sofia Constantinople' (1854); *Edinburgh Review* (April 1865, p. 456 et seq.); Besant, 'Constantinople' (1879).

SAINT SULPICE, *sẵn sũl-pēs*, the name of a famous seminary in Montreal, Canada, whose building is the oldest in that city, dating back to 1684. It is also the name of a famous seminary for priests in Paris, France.

SAINT SWITHIN, an English prelate of the 9th century, chaplain to King Egbert and tutor to his son, Ethelwulf. He was ordained to the priesthood in 830, was charged with the education of Prince (afterward king) Alfred, and in 852 was made bishop of Winchester. He died about 10 years later. He was canonized a century later. The popular knowledge of this saint's name is due to the belief that if rain falls on 15 July (which is commonly known as Saint Swithin's Day) it will rain for six weeks after. This notion is said to have arisen from the fact that when the bones of Saint Swithin were about to be removed, after his canonization, from their original resting-place in Winchester church-yard to the interior of the cathedral, their removal, which was to have taken place on 15 July, was delayed for 40 days by the excessive rains which fell uninterruptedly for that period. In France, the watery saints' days are those of Saint Médard (8 June) and saints Gervais and Protas (9

June); in Flanders the rainy saint is Saint Godelieve; and in Germany there are three saints' days, to which this belief attaches. The origin of the tribute called "Peter's Pence" has often been assigned to Saint Swithin.

SAINT THOMAS, formerly one of the Virgin Islands, Danish West Indies, since 1917 a possession of the United States, lying 43 miles east of Porto Rico; area, 33 square miles. The surface is hilly, and only a small portion of the land is cultivated; sugar-cane, aloes, fibrous plants, fruit, cotton and vegetables are raised. Earthquakes are frequent but not as destructive as the severe hurricanes, which have several times done a considerable amount of damage in the island. Saint Thomas was once of great commercial importance, its capital, Charlotte Amalie, was at one time one of the chief emporia of the West Indies. Since the introduction of steam vessels, and especially since 1885, its trade has greatly declined, and Barbados has taken its place as a trade centre. Charlotte Amalie is still of importance as a coaling station, and is a port of call for steamers. The island was first colonized by the Dutch, was held by Great Britain in 1667-71, 1801 and 1807-15, and finally came into the possession of Denmark. In 1870 negotiations were made for its purchase by the United States, but Congress refused to ratify the treaty; it was also included in the treaty of 1902 for the purchase of the Danish West Indies by the United States, which was rejected by the Danish Folkething. The final act of more than 50 years' effort to bring the Danish West Indies under the American flag was completed 31 March 1917, when a treasury warrant for \$25,000,000 was handed to the Danish Minister at Washington for Saint Thomas, Saint Croix and Saint John. Pop. 11,150. See VIRGIN ISLANDS.

SAINT THOMAS, Canada, city and county-seat of Elgin County, Ontario, on the Canadian Pacific, Grand Trunk, Michigan Central, Wabash and Lake Erie and Detroit River railways, 75 miles southwest of Hamilton, and nine miles north of Port Stanley on Lake Erie. It is one of the most important railway centres in southern Ontario, is the receiving and distributing centre for a rich fruit and farming country, and has an extensive local and export trade. The Michigan Central Railway has large car-building and machine shops here employing many men, and there are important manufactures of foundry products, farm implements, carriages and wagons, mattresses, brooms, churns, blocks and tackle, flax, flour and planing mills, and breweries. Saint Thomas has gas, electric lights and waterworks; fine county buildings, city hall, market, Alma Ladies' College, Sinclair College, Collegiate Institute, public library, Amasa Wood Hospital, Thomas Williams Home for the Aged, children's home, 11 churches, many handsome residences and hotels, banks, and daily and weekly newspapers. Assessed property valuation about \$9,874,957. Pop. 14,054.

SAINT THOMAS (Port. *SAN THOMÉ*, *sẵn to-mă*), West Africa, a volcanic island in the Gulf of Guinea, 170 miles west of the mouth of the Gabun River, belonging to Portugal. Its highest peak, Saint Anna, rises from the centre of the island to a height of about 7,000 feet. The valleys are fertile but unhealthy; the ele-

vated portions, swept by fresh breezes, are on the contrary, salubrious. The chief products are coffee and cocoa, cotton, sugar, indigo, sweet potatoes, dates, etc. There are large numbers of domestic animals. Saint Thomas, on the northeast coast, is the seat of a bishop, and the chief town. The island was discovered by the Portuguese on Saint Thomas Day, 1471, and was colonized in 1493. The Dutch occupied it from 1641 to 1844. With the island of Principe it forms a province administered by a governor with a total area of 360 square miles, and total pop. of 68,221.

SAINT THOMAS. See *SÃO THOMÉ*.

SAINT THOMAS, Christians of. See *CHRISTIANS OF SAINT THOMAS*.

SAINT VALENTINE'S DAY, the 14th of February, so called after a Christian martyr of the Roman period. The custom peculiar to the day of exchanging missives of affection and love is believed to have been handed down from the Roman festival of the Lupercalia, celebrated in the month of February, when the names of young women were put into a box and drawn out by men as chance directed. For many centuries, if not up to the present time in certain remote districts, Saint Valentine's Eve was celebrated in a manner very similar to the fashion of Roman heathen times, maids and bachelors throwing billets with their names on into a receptacle and drawing therefrom by chance the name of some one of the opposite sex, who became thereupon for the year following the "valentine," or chosen companion, of the other more or less lucky individual. The sending of valentines by message or mail is one outgrowth of the custom formerly prevalent. The custom has expanded in the presentation of affectionate valentines by parents to children and children to parents and husbands and wives to each other. In genial climates Valentine's Day is about the mating period of birds, and this is supposed to have had something to do with the origin of the customs with which the day is associated.

SAINT-VICTOR, *sẵn-vĕk-tōr*, **Jacques Benjamin Maximilien**, *COMTE DE*, West Indian author: b. Fort Dauphin, Santo Domingo, 14 Jan. 1770; d. Paris, France, 8 Aug. 1858. He was educated at the college of La Fleche, France, and entered journalism. During Napoleon's reign he was on the staff of *Journal des Débats* and after 1815 he established several Roman Catholic and royalist magazines. He revisited his native land in 1830, spent two years in the United States and then made a tour of the West Indies. He wrote 'Tableau historique et pittoresque de Paris depuis les Gaulois jusqu'à nos Jours' (1808-12); 'Œuvres poétiques' (1882); 'Lettres sur les Etats-Unis écrites en 1832-33' (2 vols., 1835); 'Journal de Voyage' (2 vols., 1836), etc.

SAINT-VICTOR, **Paul Binsse**, *COMTE DE*, French author: b. Paris, 11 July 1825; d. there, 9 July 1881. He first made himself known as a dramatic and art critic, but soon rose to eminence as a student of the drama and of art and a permanent contributor to the literature of these subjects. His best-known books are 'Men and Gods' (1867-72), and 'The Two Masques' (1880-83). He also wrote 'The Women of Goethe' (1869); 'Victor Hugo' (1885); 'An-

cients and Moderns' (1886), and 'The Theatre of To-day' (1889).

SAINT VINCENT, *vĭn'sĕnt*, **John Jervis**, *EARL*, English naval officer: b. Medford, Staffordshire, 9 Jan. 1734; d. 15 March 1823. He entered the navy as able seaman in 1744 and in 1760 was promoted to captain and in 1787 to rear-admiral. In the Quebec expedition he led the advance squadron in charge of transports. In 1790 he was returned to Parliament for Wycombe. He commanded in the naval expedition against the French West Indies in 1793 and two years later was made admiral and given command of the Mediterranean fleet. In the engagement with the Spanish fleet of Cape Saint Vincent, 14 Feb. 1797, he captured four of the enemy's ships and averted the impending invasion of England. For this he was granted a pension and made Earl Saint Vincent. He was first lord of the Admiralty 1801-04 and introduced many reformatory measures. He held once more command of the Channel fleet, but retired in 1807. At his death the nation raised a statue to him in Saint Paul's Cathedral.

SAINT VINCENT, one of the Windward Islands, British West Indies, lying between Saint Lucia and Grenada, area, 150.3 square miles. A chain of volcanic mountains traverse the island from north to south, culminating in the volcano of Soufrière in the north (3,000 feet). Many of the valleys are fertile and about one-sixth of the total area is under cultivation. Sugar was once the most important product, but the sugar industry has declined, especially since the hurricane of 1898 which destroyed a large number of plantations. The production of arrowroot has correspondingly increased in importance; cocoa, cotton, fruits and vegetables are also raised, and good timber is obtained from the forests. There is a considerable trade, particularly with the United States. In 1914-15 the total imports had a value of \$546,595; exports, \$548,975; total revenue, \$162,340; total expenditure, \$190,225; public debt, \$23,500. The island was discovered by Columbus in 1498, and was then inhabited by Caribs; the Caribs were finally subdued by Great Britain in 1795-96 and transported to Ruatan, in the Bay of Honduras; a few returned to Saint Vincent where a reservation was assigned them. The island is governed by an administrator and a legislative council of three official and four nominated unofficial members; before 1877 there was a representative government. In 1812 an eruption of Soufrière devastated a part of the island, and in May 1902 occurred another eruption, contemporaneous with that of Mont Pelée (q.v.). Premonitory signs of eruption were given as early as February 1901, and these warnings increased as soon as Mont Pelée began to be active; the eruption commenced on 6 May, with a burst of smoke, followed by flames; it ceased for a time the next morning, but reached its full force in the afternoon of that day (7 May). Several large plantations were destroyed and about 1,600 persons killed. Pop. 41,877.

SAINT VINCENT DE PAUL. See *VINCENT DE PAUL, SAINT*.

SAINT VINCENT DE PAUL, Society of. See *SOCIETY OF SAINT VINCENT DE PAUL*.

SAINT VITUS' DANCE. See *CHOREA*.

SAINTE AGATHE DES MONTS, Canada, village in Terrebonne County, Quebec, 60 miles northwest of Montreal, on Rouge River, and on the Northern Pacific Railroad. It has a lumber industry and is a year-round health resort. Pop. 2,020.

SAINTE ANNE DE BEAUPRÉ, *sănt ân de bô-pră*, Canada, a village of Montmorency County, Quebec, at the mouth of the Sainte Anne River, on the north shore of the Saint Lawrence River, 25 miles by rail northeast of Quebec. The fine modern basilica and the ancient parish church, containing relics of Sainte Anne, are visited annually on the saint's feast day, 26 July, by thousands of pilgrims. Sainte Anne is also a favorite summer resort, with up-to-date stores and hotels. Pop. 2,066.

SAINTE ANNE DE BELLEVUE, or **SAINT ANNES**, Canada, town in the province of Quebec, on the island of Montreal, between the Lake of Two Mountains and Saint Louis Lake at the confluence of the Ottawa and the Saint Lawrence rivers, 20 miles southwest of Montreal, on the Grand Trunk and the Canadian Pacific railways. The Macdonald College of Agriculture is located here and there is a Roman Catholic college. The town is patronized as a summer resort. Pop. 1,416.

SAINTE ANNE DE LA POCATIERE, Canada, town in the province of Quebec, on the Saint Lawrence River, 70 miles northeast of Quebec and on the Intercolonial Railway. There is a Roman Catholic college and also an agricultural experiment farm and milling industries. Pop. 2,412.

SAINTE-BEUVE, *sănt bév*, **Charles Augustin**, French literary critic: b. Boulogne-sur-Mer, 23 Dec. 1804; d. Paris, 13 Oct. 1869. He was educated at a school in his native town, and from 1818 at the Collège Charlemagne and the Collège Bourbon in Paris. He studied the physical and natural sciences under Lamarck and Magendie and in 1823 entered the school of medicine, subsequently becoming assistant surgeon to the Hospital Saint Louis. In 1824 he became a contributor to the *Globe*, a liberal and philosophical journal. A review of Victor Hugo's 'Odes and Ballads' contributed in 1827 gained him the friendship of the poet, and thenceforward he identified himself with the romantic movement. His first volume, 'An Historical and Critical Tableau of French Poetry and the French Theatre in the XVIth Century,' appeared in 1828. In 1829 appeared his novel, 'Vie, poesies, et pensées de Joseph Delorme'; and in 1830 he dedicated a volume of poems, 'Consolations,' to Victor Hugo. About this period he was associated with Saint Simonians, and afterward with Lamennais, but soon broke with them and also with Hugo and the romanticists. Persuaded by M. Buloz, he undertook a series of literary portraits for the 'Revue des deux mondes,' in which he displayed great skill. His novel 'Volupté' (1834), essentially autobiographical, may be regarded as marking this turning point in his career, but 'Pensées d'août' (1837), a volume of poems, is still colored by his religiosity. His next and greatest work, 'Port Royal' (5 vols., 1840-60), is a history of Jansenism. He was admitted a member of the French Academy in 1844 and four years later accepted a professorial chair

at Liège. His lectures there formed the basis of his next work, 'Châteaubriand et son groupe littéraire sous l'Empire' (1860). He eagerly welcomed the *coup d'état* and finding it impossible under the second empire to secure a hearing at the Collège de France, where he was professor, published his undelivered lectures in a volume entitled 'Etude sur Virgile' (1857). In 1865 he was appointed a senator and regained popularity by his defense of freedom of thought and speech. In 1849 he began the series of Monday critical articles on literary subjects which has gained him a European reputation. These articles were published in two series, 'Causeries du lundi' (1851-62) and 'Nouveaux lundis' (1863-72). Among his other works are 'Portraits de femmes' (1844); 'Portraits littéraires,' 'Portraits contemporains' (1846); 'De la liberté de l'Enseignement' (1868); 'P. J. Proudhon, sa vie sa correspondance' (1872); 'Lettres à la princesse' (1873, being letters to Mathilde, sister of Napoleon III); 'Chroniques parisiennes' (1876); 'Correspondance' (1877-78); 'Nouvelle correspondance' (1880); 'Le clou d'or' (1880); 'La pendule' (1880), and 'Lettres au Professeur Gaullieur' (1895). (See CAUSERIES DU LUNDI). Consult D'Haussonville, 'Sainte-Beuve, sa vie et ses œuvres' (Paris 1875); Pons, 'Sainte-Beuve et ses inconnues' (ib. 1879); Troubat, 'Souvenirs du dernier secrétaire de Sainte-Beuve' (ib. 1890); Vattier, 'Sainte-Beuve' (ib. 1892); Fisher, 'A Group of French Critics' (1897); Brunetière, 'Evolution des genres' (Vol. 1, 1899); Harper, G. M., 'Sainte-Beuve' (New York 1909); Pollak, G., 'International Perspective in Criticism' (ib. 1914).

SAINTE CHAPELLE, Paris, one of the most interesting of the old architectural monuments of the French capital. It stands entire inside the Palais de Justice, in the large court to the left of the main entrance from the Boulevard du Palais. It was built in 1245-48, during the reign of Saint Louis, as the chapel of the royal palace, a few other remnants of which now form parts of the Palais de Justice. The main body (115 feet long and 36 feet wide) is a Gothic nave almost perfect in style. The upper chapel, used by the royal family, has an exquisite interior, and almost the entire wall-space is occupied by 15 large windows of stained glass set in beautiful tracery. Services are held in the chapel once a year at the opening of the courts.

SAINTE-CLAIRE DEVILLE, *sănt'klăr'-dê-vêl'*, **Henri Etienne**, French chemist: b. Saint Thomas, West Indies, 11 March 1818; d. Boulogne-sur-Seine, 1 July 1881, and educated in France. After considerable experience as a teacher of science he became professor of chemistry at the Sorbonne in Paris in 1859. He early began important and far-reaching researches into the phenomena of "dissociation," physicochemical reactions, which he was the first to study scientifically. In his own particular field of investigation and research he has done important work which increased and made more accurate our knowledge of chemical reactions. Deville put the aluminium and the magnesium industries on a practical and commercial footing and he produced both metals on a large industrial scale. He discovered toluene and anhydride of nitric acid and made useful re-

searches into the metallurgy of platinum and other metals. Consult Gay, Jules, 'Henri Sainte-Claire Deville, sa vie et ses travaux' (Paris 1889).

SAINTE CROIX, kroi, an island of the West Indies. See SANTA CRUZ; VIRGIN ISLANDS.

SAINTE CUNÉGONDE, kū'nē-gond, Canada, a city of Hochelaga County, Quebec, two miles distant from Montreal, of which it is a suburb. It has many handsome residences, churches and schools and some manufactures. Pop. about 12,000.

SAINTE GENEVIEVE, sânt jën'ē-vēv, Mo., city, county-seat of Sainte Genevieve County, on the Mississippi River, 46 miles south of Saint Louis. It was first settled by the French in 1735, being the oldest settlement in the State. The site of this original settlement was about three miles south of the present site, but a severe flood in 1785 caused the colonists to move to higher ground. In 1810 it had a number of large stores and was the place from which Saint Louis obtained supplies. It is situated in an agricultural and stock-raising region; there are limestone quarries and copper mines in the vicinity, and the city contains several lime kilns and flour mills; fruit-growing and wine-making are also important industries. It is the seat of a Roman Catholic convent and academy. Pop. 2,000.

SAINTE THÉRÈSE, or **SAINTE THÉRÈSE DE BLAINVILLE**, tă'rēz dē blān'vël', Canada, village in the province of Quebec, on the Rivière aux Chiens, a loop of the Saint Lawrence River, 15 miles northwest of Montreal, on the Canadian Pacific Railway. There is a Roman Catholic college here and a convent. Industries include the manufacture of furniture and pianos. Pop. 2,120.

SAINTES, sânt', France, town in the department of Charente-Inférieure, 28 miles southeast of Rochefort, occupies a picturesque slope overlooking the Charente, which is crossed at this point by a bridge formerly supporting the ancient triumphal arch of Germanicus. Among other interesting Roman antiquities are the ruins of an amphitheater, which is only surpassed by the Colosseum of Rome. In the Antiquarian museums are preserved 7,000 medals and many pieces of sculpture. Saintes, anciently known as Mediolanum, was once a bishop's see; the ancient cathedral (Saint Pierre), still standing, was nearly destroyed (1568) by the Huguenots. There are other ancient churches, including Notre Dame, a fine example of architecture of the 11th and 12th centuries, and the church of Saint Eutropius, founded in the 6th century and rebuilt in the 16th. The other public buildings are the Palais de Justice, a communal college, library and theatre. There are manufactures of iron, copper, woolen and cotton goods, pottery, casks and leather. Trade is in wheat, corn, brandy, timber, etc. Saintes was the ancient capital of the Santones, and later, of the province of Saintonge. Pop. about 20,000.

SAINTIN, sânt-tān, Jules Emile, French painter: b. Lemé, Aisne, France, 14 April 1829; d. Paris, 14 July 1894. He studied under Drölling, Picot and Leboucher and won several medals in the Salon and a third-class medal at

the Paris Exposition of 1889. Several years of his life were spent in the United States where he painted some fine portraits and several genres such as 'The Pony Express' (1863) and 'Abandoned' (1880). Among his American portraits is that of Stephen A. Douglas (1860). His work as a portrait painter was correct and academic, and most of his genre pictures derived their main interest from the subjects they represent, not from any inherent distinction of style or handling.

SAINTINE, sânt-tēn, pseudonym of JOSEPH XAVIER BONIFACE, French novelist, poet and dramatist: b. Paris, France, 10 July 1798; d. there, 21 Jan. 1865. He wrote about 200 plays, a volume of poetry and several philosophical stories. His best known work is 'Picciola' (q.v.) (1837), which received the Montyon prize, ran through 40 editions and was translated into several languages. He published a series of stories entitled 'Jonathan, the Visionary' (1827); 'History of the Wars in Italy,' etc.

SAINTS' DAYS are days set apart by the Roman Catholic Church for religious services in honor of particular saints, after whom the days are named in the calendar. The celebrations differ in different countries, and according to the relation of the name of a particular saint to a particular locality. In the United States and Great Britain such celebrations take the form of religious services held in churches. In continental Europe and in South America saints' days often take the form of great municipal or even national celebrations. In Sweden, which is Lutheran as to state religion, it is customary to celebrate what is known as the name-day or day of the saint after whom a person is named, in a similar manner to a birthday.

SAINTS' EVERLASTING REST, The, a devotional work published by Richard Baxter (q.v.) in 1650. By its deep piety and its style of dignified eloquence, hardly a word of which has grown obsolete, it has taken a place with the 'Pilgrim's Progress' in the literary treasures of English Nonconformity. Consult French, 'Baxter and the Saints' Rest' (1877).

SAINTSBURY, sânts'bū-rī, George Edward Bateman, English literary critic: b. Southampton, 23 Oct. 1845. He was educated at Oxford, was senior classical master in Elizabeth College, Guernsey, 1868-74, when he became headmaster of Elgin Educational Institute 1874-76. From 1875 to 1895 he was engaged in journalistic and literary work in London, and in the last-named year became professor of English literature in Edinburgh University. He holds a leading place among contemporary English critics and among his many published works are 'Primer of French Literature' (1880); 'Dryden' (1881); 'Short History of French Literature' (1882); 'Manchester' (1887); 'History of Elizabethan Literature' (1887); 'Essays in English Literature 1780-1860' (1890); 'Essays on French Novelists' (1891); 'Miscellaneous Essays' (1892); 'The Earl of Derby'; 'Corrected Impressions' (1895); '19th Century Literature' (1896); 'The Flourishing of Romance and the Rise of Allegory' (1897); 'Sir Walter Scott' (1897); 'A Short History of English Literature' (1898); 'Mat-

threw Arnold' (1899); 'A History of Criticism' (Vol. I, 1900; Vol. II, 1902; Vol. III, 1904); 'The Earlier Renaissance' (1901); 'Loci Critici' (1903); 'Minor Caroline Poets' (Vol. I, 1905; Vol. II, 1906); 'A History of English Prosody' (Vol. I, 1906; Vol. II, 1908); 'The Later Nineteenth Century' (1908); 'Historical Manual of English Prosody' (1910); 'History of English Criticism' (1911); 'History of English Prose Rhythm' (1912); 'The English Novel' (1913); 'First Book of English Literature' (1914); 'The Peace of the Augustans' (1915).

SAIONJI, sī'ōn-jē, **Kinmochi**, MARQUIS, Japanese statesman: b. Kioto, 1849. He studied law in Paris as a young man and became acquainted with M. Clemenceau and the younger Radicals of the Third Republic. He was for a time Minister Plenipotentiary to Germany and Austria-Hungary. For many years closely associated with the late Prince Ito, he succeeded the latter as leader of his party, became president of the House of Peers and of the Privy Council, Minister of Education and twice Prime Minister of Japan, 1906-08 and 1911-12. He is one of the three oldest statesmen of Japan, and acted as head of the Japanese delegation to the Inter-Allied Peace Conference in Paris.

SAIS, sā'is, Egypt, in hieroglyphics SA, a ruined city on the Rosetta or Canopic branch of the Nile, 67 miles northwest of Cairo; site now occupied by the village of Sa-el-Hagar, or Sa of the Stone, which contains no remains of temples or palaces. It was an ancient religious capital, whose famous temple of the goddess of Neith contained the mysterious veiled statue, the subject of Schiller's ballad and of Novalis' romance. In Sais the fête of burning lamps was celebrated, attracting many foreigners; and here was a tomb of Osiris. Sais was also a renowned educational centre frequented by the Greek sages. It gave its name to two Egyptian dynasties, founded by natives of the city. The Saiti kings ruled Egypt for 150 years, until the country was invaded by the Persians under Cambyses. Consult Lepsius, 'Briefe' (p. 12); Wilkinson, 'Modern Egypt' (Vol. I, p. 183); Champollion, 'L'Egypte' (Vol. II, p. 219); also Herodotus (II, 29, 59, 169), and Strabo (XVII, 801).

SAIVAS, sī'vaz, one of the three great divisions of the Hindu religion and meaning the worshippers of Siva. These are separated into sects which have varied in number at different periods in the religious history of Hindustan. The worship of Siva seems from a remote period more that of the learned and speculative classes than of the masses of the people. No poetic legends are recorded of this deity. Consult Wilson, 'Sketch of the Religious Sects of the Hindus' (1862); Monier-Williams, 'Religious Thought and Life in India' (1883); Barth, 'Religions of India' (trans., 1882).

SAJOU, same as SAPAJOU (q.v.).

SAJOUS, sa-zhoo', **Charles Euchariste de'Médicis**, American physician and author: b. at sea off coast of France, 13 Dec. 1852. He was graduated from Jefferson Medical College, Philadelphia, in 1878, and was clinical lecturer there 1884-90; professor and dean of the medical faculty of the Medico-Chirurgical College 1898, and professor and president of the faculty of Temple University Medical School after

1909. He received the degrees of LL.D. from Saint Joseph College 1909, and Sc.D. from Temple University in 1915; was made officer of the Academy of France in 1889; Knight of the Legion of Honor of France in 1892; Knight of the Order of Leopold of Belgium in 1890. Dr. Sajous is a Fellow of the American Philosophical Society and of the Academy of Natural Sciences and honorary and corresponding member of various foreign societies. He has edited Sajous's *Annual* of the Universal Medical Sciences (45 vols., 1888-96); Sajous' 'Cyclopedia of Practical Medicine' (8 vols., 1896 et seq.); is senior editor of the *New York Medical Journal* (1911-); was president of the American Medical Editors' Association 1903 and has written 'Diseases of the Nose and Throat' (1884) and 'The Internal Secretions and the Principles of Medicine' (1903-16). The latter work was the first to show that the ductless glands sustained life in the tissue cells and that they played a leading part in most diseases, as defensive organs.

SAKAI, sā'kī, Japan, on the southwest of the island of Hondo, seven miles south of Osaka. Before the rise of the latter town it was the chief commercial port of Japan. Osaka now monopolizes the trade. Pop. 67,706.

SAKHALIN, sā-gā-lēn', or **SAGHALIEN** (properly **KARAFUTU**), Siberia, a long mountainous island in the north Pacific, opposite the mouth of the Amur. Its area contains 24,560 square miles. The Strait of La Pérouse separates it on the south from Yezo, Japan, and the Sea of Okhotsk bounds its eastern and northern shores. The narrow and shallow Strait of Tartary separates it from the mainland. Mounts Bernijet and Ktöns-pal (2,000 to 5,000 feet) are the highest points of mountain ranges extending from north to south and interspersed with valleys of varying width. The principal rivers are the Tym and the Poronai, navigable for a short distance and teeming with fish, especially salmon. Petroleum and naphtha exist and coal is mined by Russian convicts. Agriculture does not succeed owing to the extremely rigorous climate. The island is covered with dense forests. Bears, tigers, sables and wild reindeer abound. Vegetation is Siberian in character. Sakhalin's history begins with the Stone Age, relics of which and of the Bronze Age are still extant, as seen in houses, bones and implements discovered. The island formerly belonged to the Chinese Empire, but early in the 19th century it was annexed by the Japanese who ceded it to Russia in 1875. By the Treaty of Portsmouth, N. H. (1905), following the Russo-Japanese War, the southern portion of the island was ceded to Japan by Russia, which retained the northern portion. The Japanese portion, now known as Karafuto, has an area of 13,253 square miles and a population of 49,463, and the Russian an area of 14,668 square miles and a population of 33,500. Besides the Russians and Japanese other inhabitants are Ainos, the aborigines, a primitive and peculiar race, Gilyaks and Oroks. The most important industry of the island is the herring fisheries, but large areas are highly adapted to agriculture and pasturage. There is a large forest area of larch and fir trees. The chief minerals are coal and alluvial gold.

SAKHARA, sāk-kā'rā, Egypt, the necropolis of Memphis, about two miles distant from the ruins of the ancient city on the confines of the Libyan Desert. The chief interest lies in its antiquities, tombs and catacombs. Many pyramids rise among its ruins, one of which is remarkable for its doorway of inlaid tiles, bearing a royal name. Mariette discovered numberless sarcophagi, catacombs of the sacred Ibis, tombs of the god Apis, numerous grottoes, etc. What is believed to be the oldest mummy in the world, that of a son of Pepi I of the 5th dynasty, probably over 6,000 years old, was discovered here.

SAKI, a South American monkey of the genera *Brachyurus*, *Pithecia* and related groups. Its marked peculiarities are a non-prehensile tail, covered with very long hair, round head, short muzzle, ears not unlike those of humans and long-hair covering of entire body. See **MONKEY**.

SAKI, sāk'kē, or **SAKE**, the native beer and common stimulating drink of the Japanese. It is made from rice and is drunk warm, producing a very speedy but transient intoxication.

SAKIEH, sāk'i-ē, **SAKIA**, or **SAKEE-YEH**, a machine used in Egypt for raising water from the Nile for the purpose of irrigation. It is a modification of the Persian wheel and consists of a series of cogged wheels, turned by a buffalo or camel, each revolution of the wheel working up a series of earthen pitchers which empty themselves into a trough or pool.

SAKTA, sāk'tā, the designation in the Hindu religion of a worshipper of the Sakti, the power or energy of the divine nature personified in a female form. If the tendencies of the worshipper are toward the adoration of Vishnu, then the personified Sakti is termed Lakshmi or Maha-Lakshmi; if it be toward that of Siva, the Sakti is dominated Parvati Bhavani or Durga. At least three-fourths of the Hindus of Bengal are of this sect, and of the remaining fourth, three are Vaishnavas to one Saiva. Wilson divides the Saktas into Dakshinis, Vamis, Kanchelias and Kararis. Another classification is into the Dakschinacharis and the Vamacharis, followers of the Right Hand and of the Left Hand Ritual. Consult 'Religious Sects of the Hindus' (1862, p. 32).

SAKUNTALA, sāk-kūn'tā-lā. This masterpiece of Hindu literature is by Kalidāsa, the leading poet of India's second, or Sanscrit, period. It is a drama in seven acts and the underlying theme as well as many of its details are derived from the Mahābhārata, the great national epic of the Hindu race. There are a number of versions of Sakuntala (also spelled Çakuntala or Shakuntala) extant, the Bengalee one coming closest to the original. The drama has also been fashioned for the use of the European stage by Wolzogen, Donsdorf and others. The story of the play runs as follows: King Dushanta weds Sakuntala, the adopted daughter of the pious hermit Kama, but on her being brought to his court he fails to recognize her, owing to a curse having been pronounced against him. The despairing bride is translated to the realm of the genii, until finally the recovery of a ring, the pledge of mutual faith and love, leads to the reunion of the couple. The great charm of Sakuntala lies

in the descriptive powers displayed by the poet, his keen appreciation of the beauties of nature and of the seasonal changes; his wealth of words is marvelous; his phraseology is often brilliant and picturesque, and the sentiments expressed, particularly as to the master passion, love, are delicate and psychologically true. The action, however, drags and is overburdened with side issues, and the diction suffers from its excessive artificiality and verbosity. Added to these defects is a lack of the sense of proportion, such as the Greek genius possessed in so high a degree. Nevertheless, all authorities are agreed on the rare and dainty charm of Sakuntala, and Goethe bestowed unqualified praise upon it. The exact time when the poet Kalidāsa lived and wrote this drama is shrouded in uncertainty. Indian tradition and authorities variously assign the time to the 3d century B.C. and up to the 6th century A.D. From strong internal evidence, particularly because of the extremely corrupted form of the Prakrit spoken in the play by the women and subsidiary characters, it is now concluded that the correct period must have been the 2d or 3d century A.D. Consult Schuyler, Montgomery, Editions and Translations of Çakuntala (in American Oriental Society Journal, Vol. XXII, Boston 1901); Henry, V., 'Les littératures de l'Inde' (Paris 1904); Macdonell, A. A., 'History of Sanskrit Literature' (London 1913).

WOLF VON SCHIERBRAND.

SAL-AMMONIAC. See **AMMONIA**.

SAL-TREE, a valuable timber-tree of India (*Shorea robusta*) second in importance only to the teak. It is found in large forests along the base of the Himalayas and again in another belt in eastern India. It belongs to the order *Dipterocarpaceae* and yields a hard, heavy dark-brown, close-grained wood which is very durable and highly valued, particularly for gun-carriages and railway ties. A whitish aromatic resin (saldammar) used to calk ships and also for incense (see **DAMMAR**) is obtained by tapping the trunk. The tusser silkworm feeds on the leaves. The sal forests are protected by the government of India.

SALA, sā'lā, George Augustus Henry, English journalist and author: b. London, 24 Nov. 1828; d. Brighton, Sussex, 8 Dec. 1895. He received some instruction in drawing, but at 15 was obliged to provide for himself. He was a theatrical scene painter for a time, then turned to etching and engraving and had some success as an illustrator. In 1848 he turned to literature and from 1851 to 1856 contributed regularly to *Household Words*, edited by Charles Dickens. His first experience as "special correspondent" was in the letters he wrote for this journal from Russia after the Crimean War. In 1863-64 he was in the United States reporting the Civil War for the *Daily Telegraph*, and later published 'My Diary in America in the Midst of the War.' He followed Napoleon III to Algiers and published as a result, 'A Trip to Barbary by a Roundabout Route' (1866). He established *Temple Bar*, a periodical which he edited from 1860 to 1866, and derived a large income from journalism, but much of his work is cheap and inflated, and no doubt was an important factor in the development of modern reprehensible newspaper methods. He wrote a critical biography

of William Hogarth (1860); and, in addition to works of travel already mentioned, 'America Revisited' (1882); 'A Journey due South' (1885); 'Right Round the World' (1888), works embodying his observations as a tourist and lecturer across the American continent to Australia and India.

SALAAM, sa-lām', or **PEACE BE WITH YOU**, the common salutation among Mohammedans. The answer is, "On you be peace and the mercy of God and his blessings." It is improper to address this answer to any but a believer.

SALAD PLANTS, various herbs whose tender, succulent foliage is eaten raw, with or without a dressing. In general, salads should be grown quickly and served as soon as possible after being gathered. They all delight in moist, rich soil with abundance of humus and nitrogenous plant food. Most of them may be sown as soon as the soil can be worked in spring, and some may be sown in autumn and allowed to remain until spring. Few do well in hot weather. Clean cultivation is essential with all of them, and since they are usually quick-growing plants, they are favorites for growing between the rows of later maturing plants, such as cabbage, peas, beets, etc., which are themselves used by market-gardeners in the same way, a later crop being put upon the land as soon as they are gathered. That is a crop of salads, one of cabbage and one of perhaps celery may be obtained from the same area in one season.

In America the most important salad is lettuce, which is extensively grown by truckers and market-gardeners, especially in the East from Florida to Massachusetts, the season starting in January in the South and advancing northward until June, the hot weather checking its production. In the autumn there is a less marked southerly migration. In the North large quantities are also grown under glass to supply local demands. Probably the endive ranks second as a market salad. Its consumption is, however, far less than that of lettuce, and it is less cultivated in the South than in the North, where the cooler climate is more suitable. As a home-salad mustard and cress are probably of next importance in America; in Europe they are grown in enormous quantities for the general market, but in America they are seldom offered for sale. Watercress is more important as a market salad and probably ranks next to endive. It is grown in streams or in damp ground, immense quantities being shipped to the Eastern markets from Virginia. Chicory and dandelion are both popular in the East, but probably more as pot-herbs than as salads. They usually require longer to attain edible size than lettuce and like endive are generally blanched. Chicory is occasionally used in the United States to make *barbe de capucin* and *witloof*, two salads very popular in Europe. The roots are dug in autumn, trimmed and for the former laid horizontally in pyramidal heaps with alternate layers of sand or soil in dark cellars and kept moist by occasional watering; for the second they are buried vertically and covered with some fermenting material for a few weeks. The former is the succulent leaf produced; the latter is a small head something like brussels sprouts. Either may be used as salad or as pot-herb.

SALADIN, sāl'a-dīn, or properly **SALAH-ED-DIN YUSSUF IBN-AYÜD**, sultan of Egypt and Syria: b. Tekrit, 1137; d. Damascus, 3 March 1193. He entered the service of Nureddin, emir of Syria; became vizier in Egypt about 1169; suppressed the Fatimites in 1171; was proclaimed sultan in 1174 and conquered Damascus and Syria. The great object of his policy was to expel the Christians from Palestine, and recover the city of Jerusalem (see **CRUSADES**). An atrocious massacre of Mohammedan pilgrims by Chatillon added to his ardor; and his vow of revenge against the perpetrator he was enabled to make good by his famous victory on the plain of Tiberias in 1187, where he captured Guy de Lusignan, king of Jerusalem, Chatillon (whom he cut down after the battle with his own scimitar) and many more. The fruits of this victory was the towns of Acre, Said and Beyrout; after which he laid siege to Jerusalem, which yielded (1187) in a capitulation, to the articles of which Saladin faithfully adhered. He then proceeded against Tyre, but failed in consequence of the destruction of his fleet by the Franks. The intelligence of the loss of Jerusalem reaching Europe produced the Crusade under the Emperor Frederick Barbarossa (q.v.), whose death inspired Saladin with hopes soon damped by the arrival of the forces of Richard Cœur-de-Lion of England, and of Philip Augustus of France. The recovery of Acre by the two kings took place in 1191, upon which event Philip returned to France, and Richard, after twice defeating the sultan, took Caesarea and Jaffa, and spread alarm as far as Jerusalem. At length a truce was concluded between Richard and Saladin (1192), by the terms of which the coast from Jaffa to Tyre was ceded to the Christians, while the rest of Palestine remained to the sultan. The departure of Richard freed Saladin from his most formidable foe. Though chargeable with unjustifiable means of acquiring power, Saladin employed it, when obtained, usefully for his subjects, whose burdens he lightened, while he benefited them by many useful works and establishments. Magnificent in his public undertakings, he was frugal in his personal expenses. He has been celebrated in Western literature for courage, moderation and justice. Scott introduces him into 'The Talisman,' disguised as the physician Adonbec and as Ilderim. Consult Gaston-Paris, 'La légende de Saladin' (Paris 1893); Reinaud, 'Notice sur la Vie de Saladin' (1874); Baha-ed-din, 'The Life of Saladin' (1897); Lane-Pool, 'Saladin, and the Fall of the Kingdom of Jerusalem' (1898); Yusuf ibn Rafi, 'The Life of Saladin' (tr. for Palestine Pilgrims' Text Society, London 1899).

SALADO, sā-lā'thō, a river of Argentina, rising in the eastern slopes of the Cordilleras, and emptying into the Paraná after a course of 750 miles. It is salty, hence the name.

SALAL, an evergreen shrub (*Gaultheria shallon*), of the northwestern United States, from 2 to 10 feet high, with dark-green leaves and reddish twigs, bearing racemes of flowers, succeeded in August by dark-purple fruit, "salal-berries," of the size of buck-shot, rough on the outside, very juicy and of a sub-acid flavor.

SALAMANCA, sāl-a-mān'ka, Mexico, a town in the state of Guanajuato, situated in the south-western corner of the state, on the rail-

road to Guadalajara. It lies in a wide, fertile but somewhat marshy plain. Among its seven churches one is a Gothic structure built on an ambitious plan. The chief industry of the town is the manufacture of porcelain. Pop. 13,497.

SALAMANCA, N. Y., village in Cattaraugus County, on the Allegheny River, and on the Erie, the Buffalo, Rochester and Western and the Pennsylvania railroads, 54 miles south of Buffalo. It was incorporated as a village in 1878. The lumber business is the chief industry, and there are several saw and planing mills; the village also has a tannery, wire-mattress factory, cigar factories, an embroidery factory, and railroad machine shops. It contains (1917) a national bank with a capital of \$50,000, and resources of \$1,248,948. It has both natural gas and electric-light plants, and a gravity system of waterworks. The town has a public high school, established in 1881, with a school library of over 3,000 volumes; and a Roman Catholic parish school. Pop. 8,370.

SALAMANCA, sā-lā-mān'kā, Spain, (1) capital of a province of the same name, in Old Castile, 120 miles northwest of Madrid, occupying three hills on the right bank of the river Tormes. The bridge across the river rests on 27 arches and is of Roman foundation. Its numerous and magnificent ecclesiastical and educational institutions have secured for Salamanca the title of "Little Rome." On the great plaza are the town-house, post office and stores. The Plaza Mayor is one of the finest squares in Europe, and is surrounded by an arcade supported by 90 Corinthian columns. The cathedral, begun in 1513, is a fine example of the florid Gothic, with an elaborate portal, lofty dome and graceful interior columns. There are also an old and massive cathedral of Norman-French style (1102), numerous other churches, and as many convents; the College of Saint Bartholomew or Old College (1410), a classic building with an Ionic portico; College of Jesuits; that of the military order of Clatrava, College of the Archbishop (1522, by Fonseca), a colossal and sumptuous edifice with a fine façade and a chapel containing sculptures by Michelangelo; and Saint Domingo, the largest convent. The University of Salamanca is one of the most venerable and celebrated in Europe (13th century), whose students once numbered 14,000, coming from all parts of the globe. The cloisters of the two buildings comprised in the university are remarkably elegant, with graceful arches and elaborate moldings. There are numerous other schools, a theatre, bull arena, asylums, hospitals, handsome residences and palaces, etc. The most distinguished of the latter are the palaces of the Marquis of Valdecarzana and of the counts Garcigrande, Maldenadas, Espinosas and Monterey. There is an electric-light plant and manufactures of leather, blankets, hats and pottery. Salamantica (its ancient name) was an important city of the Vettones. In 222 B.C. it was taken by Hannibal and later under the Goths was a favored city. It was ravaged by the Moors and retaken in 1095. Columbus was lodged (1484-86) in the Dominican convent here. In 1543 Philip II was married to Mary of Portugal. In 1812 the Duke of Wellington gained a victory over the French under Marmont. Pop. 29,830.

(2) The province of Salamanca has an area

of 4,829 square miles, the greater part of which is covered by forests of oak and chestnut, and an estimated population of 337,580. The principal rivers are the Tormes, Douro, Yeltes, Agueda and the Alagon. There are good harvests of cereals, hemp, oil and wine. Gold is found in the streams, and iron, lead, copper, zinc and coal in the hills, but the mines are only partially developed, partly due to the difficulties of transportation. The manufactures are unimportant and mainly for home consumption. The cloth of Bejar is especially good. Tanning of hides is a considerable industry. The province is traversed by a railway to Portugal. Besides the capital, the only other cities are Bejar and Ciudad Rodrigo.

SALAMANDER, the name applied generally to the species of tailed Amphibians (*Urodela*), but originally to the common European genus *Salamandra*. The smaller strictly aquatic species are known as newts (q.v.) or tritons; some of the larger species have received special names, as Kongo-snake, hellbender Siren and water-dog (qq.v.). The remaining salamanders are terrestrial or semi-aquatic and only rarely remain permanently in the water. One Californian species (*Autodax lugubris*) is partly arboreal. They are of small size and lizard-like form; but the popular notion that they are lizards is altogether erroneous as they are strictly batrachian in structure and life-history. The skin is smooth, glandular and scaleless, the skull possesses a well-developed parasphenoid bone and two occipital condyles, and all, except a few terrestrial species, pass through an aquatic gill-breathing stage. Some of the larger aquatic species advance but little beyond this condition; but in the great majority it is larval only and is succeeded by an abranchiolate and sexually mature state. The axolotl (q.v.) of the genus *Amblystoma*, is a remarkable instance of a sexually mature larva. Many adult salamanders breathe by means of lungs, but a recent noteworthy discovery is the total absence of lungs in a large proportion of species, in which respiration takes place partly in the skin, but especially by means of a special vascular area of the pharynx. Most of the species deposit their large eggs in water, sometimes in a mass of jelly, as *Amblystoma* (q.v.), sometimes separately or in strings, as *Spelerpes*; but others, like *Desmognathus fusca* and *Plethodon*, seek drier places beneath stones and guard the eggs, and the terrestrial salamanders of Europe (*Salamandra*) are ovoviviparous. All are carnivorous and subsist upon insects, worms, etc. They are chiefly active at night, and during the day conceal themselves beneath stones and logs. During cold weather they pass into a more or less profound state of hibernation. Owing to the numerous cutaneous glands the skin is always moist and cold, from which arose the remarkable superstition that these animals, which, as a matter of fact require abundant moisture to sustain life, have the power not only of resisting, but of quenching, fire. Pliny records that he tried the experiment, and the salamander was burned to a powder; yet the fable continued to be credited till very recent times. From this old belief the name is applied to many articles, and by the ancients to a mythical creature, having fire-resisting qualities. The cutaneous secretion is poisonous to

many of the lower animals. (For a classification of salamanders see *URODELA*; for development see *EMBRYOLOGY*). Consult Cope, 'Batrachia of North America' (Washington 1889); Gadow, 'Amphibia and Reptiles' (New York 1901); Phisalix-Picot, Mme., 'Recherches embryologiques, histologiques et physiologiques sur les glands à venin de la salamandre terrestre' (Paris 1900).

SALAMANDER, a kind of gopher (q.v.).

SALAMBA, the native Filipino name for a kind of fishing apparatus, used near Manila, fitted on a raft composed of several tiers of bamboos. It consists of rectangular net, two corners of which are attached to the upper extremities of two long bamboos, tied crosswise, their lower extremities being fastened to a bar on the raft, which acts as a hinge; a movable pole, arranged with a counterpoise as a sort of crane, supports the bamboos at the point of junction, and thus enables the fishermen to raise or depress the net at pleasure. The lower extremities of the net are guided by a cord, which, being drawn toward the raft at the same time that the long bamboos are elevated by the crane and counterpoise, only a small portion of the net remains in the water, and is easily cleared of its contents by means of a landing net.

SALAMIS, sā'l'a-mīs, ancient **PIT-YOUSA** (Island of Pines), modern **KOLURI**, an island off the coast of Greece, in the Gulf of Ægina, about 10 miles east of Athens. It covers an area of about 30 square miles; is of irregular shape and rocky surface, and separated from the mainland by narrow, winding channels, giving access to the beautiful Bay of Eleusis, which has the appearance of a lake. Its soil is well adapted to the olive, and vineyards thrive. The other chief product is honey. The old city of Salamis stood on the south coast, and the famous naval battle of 480 B.C., between the Greeks and Persians, soon after the great battle of Thermopylæ, was fought in the narrow eastern strait. The new city of Salamis is on the northeast coast. The principal town is Koluri. Solon and Euripides were natives of the old city.

SALAMMBÔ, sā'lām-bô', by Gustave Flaubert, is an attempt to renew, in an age of science and according to the spirit of realism, the historical novel, which in its typical form as created by Walter Scott and practised by his numerous followers was an outgrowth of the romantic temper. It presents a reconstruction of the life of Carthage in the 3d century B.C., utilizing some of the events of the war of the Mercenaries against the Carthaginians as told by Polybius (Book I, last chapter). In preparation for his task he undertook a journey to the scene of his story, studied minutely the records and monuments of old Semitic civilization and sought patiently through familiar acquaintances with the present inhabitants of the region to discover in their life and character clues to the past. To those who impeached the accuracy of his picture he replied at length and in detail, citing authorities and warmly repelling all criticism that hinted either at ignorance or carelessness. But it is not for its erudition that the book has its fame, but for its art. Flaubert was first of all an artist, and if he

took great pains to ensure truth in the matter of his work, he took even greater pains to clothe the material in a perfect garment of words. For him, as for all great stylists, there was but one perfect word and one perfect phrase in a given case, and he knew no peace nor rest till he had found it. *Salammbô* is not a moving tale of adventure, but a series of pictures, rich, full, vivid and exquisitely wrought, in a texture of words that caresses the ear. They have both an intellectual and a sensuous charm. But they are often violent, painful, abhorrent, leaving us oppressed with a sense of the cruelty and mockery of life in Flaubert's pessimistic vision of it. Sainte-Beuve devoted a series of articles to *Salammbô* in 'Nouveaux lundis' (Vol. V). Flaubert wrote a rejoinder that is to be found in current editions of the novel and in his 'Correspondence,' Vol. II. An English translation was made by M. French Sheldon (London 1886).

ARTHUR G. CANFIELD.

SALANDRA, sa-lān'dra, **Antonio**, Italian statesman: b. Lucera, Apulia, 1853. For many years a professor of administrative law at the University of Rome, he entered Parliament as deputy for his native city and early became associated with Baron Sonnino (q.v.) in the "party of constitutional opposition" against the political degeneracy of "Giolittism." After holding various posts in several cabinets Signor Salandra became Premier in March 1914 on the resignation of Giolitti. During the first months of his administration he was engaged in a severe struggle against the Parliamentary majority controlled by Giolitti. On the outbreak of the European War, Salandra refused the assistance of Italy to Germany and Austria on the ground that the Triple Alliance stipulated co-operation only in case of an attack. The Foreign Minister in his Cabinet, San Giuliano, inclined more toward the Central Powers or at least benevolent neutrality. Nor was the Foreign Minister the only member of the Cabinet to oppose the Premier's policy. With the support of Signor Martini, the Colonial Minister (and a sincere friend of France), Salandra succeeded in overcoming the opposition of his colleagues. He had correctly gauged the temper of the country and the disinclination of the army and navy to fight on the side of Austria. His hands were strengthened by the somewhat opportune death of San Giuliano in October 1914, which enabled him to invite his former chief, Baron Sonnino, to accept the portfolio of Foreign Affairs. Both were resolved from the beginning to cast in their lot with the Allies in due course, though it was necessary first to place the army on an efficient footing and to break the links of economic dependence which bound Italy to the principal partner of the alliance. While Prince von Bülow and other agents of the Central Powers were exerting themselves to influence Italian opinion, the government prepared for the breach. At the instigation of von Bülow the ex-Premier Giolitti endeavored to stir up the king and Parliament to support the German cause, and to bring about the fall of Salandra. These machinations were an open secret and only served to heighten public indignation against the conspirators. Salandra decided on a bold stroke. He tendered his resignation to the king on 13 May

1915. Italy was electrified; enthusiastic gatherings demanded "War or the Republic." It was openly expressed that the king would stake his crown if he yielded. Three days later came the news that Salandra's resignation was not accepted; the demonstrations ceased; Giolitti and the German agents left Rome, and 10 days later Italy declared war. Signor Salandra resigned in June 1916 and was succeeded by Signor Boselli.

SALANGANE, a swift (*Collocalia fuciphaga*) of the Malayan Archipelago, famous as the producer of the edible birds' nests. See **BIRDS' NESTS, EDIBLE**.

SALARY GRAB, in American history, the popular name for the general increase in Federal salaries in 1873. The Constitution provides for the compensation of the President, senators, representatives, justices and Federal officers from the Federal treasury. The Act of 3 March 1873 provided that the President's salary be increased from \$25,000 to \$50,000, that of the chief justice from \$8,500 to \$10,500, those of the Vice-President, Cabinet officers, associate justices and speaker of the House from \$8,000 to \$10,000, and of senators and representatives from \$5,000 to \$7,500. Another act, 4 March 1873, was retroactive as regards the salaries of members of Congress during the previous two years. This, the essence of the "salary grab," excited so much indignation that the laws were repealed, except those affecting the salaries of the President and justices. By later legislation, enacted without adverse criticism, \$25,000 was appropriated for the President's traveling expenses (59th Congress, 2d session), and his salary was fixed at \$75,000 per annum (60th Congress, 2d session). In 1918 the salary of the Vice-President was \$12,000 per annum; Cabinet officers, \$12,000 each; chief justices, \$15,000; associate justices, \$14,500 each; circuit judges, \$7,000 each; chief justices, Court of Claims, \$6,500; associate judges, \$6,000, and United States senators and representatives, \$7,500 per annum each and 20 cents per mile for traveling to and from Washington.

SALAWATTI, sā-lā-wā'tē, a Melanesian island off the western coast of New Guinea, off the northwestern extremity of Paupa, from which it is separated by Galewo Strait, covers an area of about 670 square miles. A chain of chalk cliffs, rising to a height of 2,500 feet, skirts the northern coast; the remaining portion is a deep valley covered with virgin forests. Salawatti was discovered by Watson in 1764. It is regarded as belonging to Dutch New Guinea. Pop. (est.) 5,000.

SALAYER, or **SALEYER ISLANDS**, East Indies, a small group of islands off the southern coast of Celebes from which they are separated by the Strait of Salayer, 13 miles wide. These islands form a part of the Dutch province of Macassar, the greatest native mart of the archipelago, in the trade passing east as far as and including New Guinea—tortoise shell, pearl shell, spices, birds-of-paradise skins and beche-de-mer. The principal island of the group is Salayer, or Great Salayer, about 35 miles long by 8 miles broad. Pop. of group, 60,000.

SALDANHA (sāl'dā'nā) **BAY**, South Africa, on the west coast of Cape Colony, 80

miles north of Cape Town, is a minor commercial port on the Atlantic, for the western territories of South Africa. It is chiefly of service in the coast trade, and of all the harbors of this seaboard is the only one affording shelter and anchorage at all seasons. It was formerly the chief Dutch naval station in South Africa.

SALE, **George**, English Oriental scholar: b. supposedly in Kent, about 1680; d. London, 13 Nov. 1736. Little is known of his life except that he was a solicitor in London, and at an early period turned his attention to the study of Arabic and other Oriental languages. In 1726 he began the publication of an Arabic translation of the New Testament for the Society for the Promotion of Christian Knowledge, and was for years engaged in the work of that association. He is best known by his admirable translation of the Koran in 1734, still highly esteemed. He wrote many Oriental biographies for Bayles' 'General Dictionary' (10 vols., 1734) and was a contributor to the 'Universal History' (1739). Consult Davenport, 'Sketch of the Life of George Sale.'

SALE, **Sir Robert Henry**, English military officer: b. Buckden, Huntingdonshire, 19 Sept. 1782; d. Mudki, India, 18 Dec. 1845. He entered the army with an ensign's commission in 1795, was promoted lieutenant in 1797 and in 1798 was ordered to India. He was engaged at Seringapatam, and in 1810 took part in the expedition against Mauritius. In 1813 he was promoted major, and in 1815 he returned to England with his regiment. He served in the expedition against Burma in 1824; in 1838 became brevet-colonel and was placed in command of a brigade in the army of the Indus. In the war with Afghanistan which followed Sale played an important part. He became major-general in 1840; was in command of the army which stormed Khurd Kabul Pass in 1841 and defended Jelalabad in the siege of 1841-42. He was knighted for his conduct at Kabul, received the thanks of Parliament for his services in the war, and the decoration of G.C.B. In the Sikh War he was wounded at the battle of Mudki, 18 Dec. 1845, and died three days later.

SALE, in law. See **SALES**.

SALEM, sā'lēm, Ill., city, county-seat of Marion County, on the Baltimore and Ohio, Southwestern and other railroads, 97 miles southeast of Springfield. It is in an agricultural and coal-mining region; its chief industry is the culture, evaporation and shipment of fruit. It has also several flour mills. Under the National Banking Law of 1913, it is in Federal Reserve District No. 8, and in 1917 had a national bank with a capital of \$50,000, and resources \$452,337. It contains a public high school, founded in 1870. Pop. 2,669.

SALEM, India, (1) chief town of a district of the same name, 207 miles southwest of Madras. It is well built, but unhealthy, being located in a narrow valley and subject to sudden and frequent changes of temperature. It has important manufactories of cotton, silk and cutlery. There is a municipal college, three printing presses, four reading-rooms and an English mission. Pop. 59,153. (2) The district embraces 7,529 square miles and is very hilly, intersected by broad plains. The principal rivers are the Cauvery with its numerous trib-

utaries. The forests are valuable, magnetic iron ore abundant, there are deposits of corundum and chromate of iron. The chief crops are millet, grain, rice, ragi, oil seeds and some cotton, indigo, coffee and tobacco. Much of the area is irrigated.

SALEM, Mass., city, one of the county-seats of Essex County, on a peninsula formed by two inlets of the Atlantic, known as North River and South River, and on the Boston and Maine Railroad, 14 miles northeast of Boston. It was founded in 1626 by Roger Conant and chartered by John Endicott in 1628. The church was organized 6 Aug. 1629 with Samuel Skelton and Francis Higginson as pastor and teacher. In 1633 Roger Williams was pastor of the church here, but was driven out in 1636. In 1692 the witchcraft delusion broke out, and 19 persons were hanged as witches on Gallows Hill, while Giles Cory was pressed to death for refusing to plead, the only instance on record in America under the English statute. (See *WITCHCRAFT*). In 1774 the first provincial assembly was held here and declared for the independence of the Massachusetts colony; and in 1775 the British under Captain Leslie were prevented from crossing the North Bridge in their search for arms and ammunition. Salem furnished over 150 armed privateers during the Revolution. It was incorporated as a city in 1836, and furnished a large quota of troops during the Civil War. It was the birthplace, and for a time the residence, of Nathaniel Hawthorne. Before the War of 1812 Salem had practically a monopoly of the East Indian and China trade; since then the foreign commerce has gradually been transferred to Boston and other ports, but there is an important coasting trade in coal, large quantities of which are landed here for transportation to inland towns. The manufacturing industries are also of importance; they include a large cotton mill, tanneries, a lead factory, chemical works, cordage works and shoe factories. In 1914 the city had 178 manufacturing plants, employing \$9,823,520 capital, using materials valued at \$7,936,035, and yielding products valued at \$13,652,586. Under the National Banking Law of 1913, the city is in Federal Reserve District No. 1, and in 1917 had a national bank with capital \$100,000, and resources \$551,533. The city is connected with Beverly, Peabody, Marblehead, Lynn and other towns by electric road, and is a centre of local trade. The town is irregularly laid out, but has a number of beautiful modern residences and three public parks. There are also several of the earliest colonial houses standing, and a large number of mansions built in the days of the town's commercial supremacy; among the former are the Corwen, or "witch house," and the birthplace of Timothy Pickering. Among the numerous points of interest in Salem are the old cemetery, formerly known as "The Burying Point," the old courthouse, where the witchcraft trials were held, the new courthouse, the new city hall, the public library, the Salem Athenæum, the Essex Institute with a valuable library of nearly 400,000 volumes and the Peabody Academy of Sciences. The Essex Institute contains a valuable historical collection of relics of colonial days and the witchcraft craze, a fine collection of old furniture and works of art, and a large number of valu-

able manuscripts; the Peabody Academy of Sciences contains an almost complete Essex County natural history collection, an ethnological collection from the Orient, Mexico and South America, largely gathered by the Salem sea captains, Japan and China being largely represented; also an interesting collection of the models and pictures of ships built in Salem. The charitable institutions include a hospital, an old ladies' home, an old men's home and a city orphan asylum. The city has a public classical and high school established 1856, and three Roman Catholic parochial schools; it is also the seat of two private secondary schools, a commercial school and a State normal school. The city government is vested in a mayor, a board of aldermen of seven members and a city council of 24. Pop. 43,697. Consult Felt, 'Annals of Salem' (2 vols.); Osgood and Batchelder, 'Historical Sketch of Salem'; Powell, 'Historic Towns of New England'; Putnam, 'Old Salem'; Silsbee, 'Half Century in Salem,' and Visitor's Guide to Salem' (published by the Essex Institute).

SALEM, N. J., city, county-seat of Salem County, on the Salem Creek near its junction with the Delaware, and on the West Jersey and Seashore Railroad, 31 miles southwest of Philadelphia, Pa. It was first settled in 1641, and this first colony was succeeded by a Swedish fort; it passed into the hands of the Dutch, then to the English in 1664, and was in that portion of New Jersey which was bought by the Quakers in 1674. The Quakers established a new and prosperous colony, and in 1682 Salem was made a port of entry; in 1778 it was plundered by the British. It is the trade centre of a fertile agricultural region; and in addition to its railroad facilities has regular steamboat communication with Philadelphia. It has also a variety of manufacturing interests, including fruit canning establishments, iron foundries, glass manufactories, flour mills, an oil-cloth factory and a hosiery mill. It had (1917) two national banks with a combined capital of \$250,000 and resources of \$3,638,874. It contains a public library, founded in 1804, and a Friends' preparatory school. Pop. 6,614.

SALEM, Ohio, city in Columbiana County, on the Pennsylvania Railroad, 61 miles southeast of Cleveland. It is the largest town in the county, and the centre of a rich agricultural and stock-raising region. Its manufacturing interests are numerous and varied; they include machine shops, manufactories of engines, wire nails, pumps and stoves, galvanized iron works, furniture, church furniture, church organ factories, brick-works and tile-works. There are (1917) two national banks with a combined capital of \$200,000 and resources of \$2,963,298. The city has a public high school, established in 1865. Pop. 8,943.

SALEM, Ore., city, capital of the State and county-seat of Marion County, on the Willamette River, and on the Southern Pacific Railroad, 44 miles south of Portland. It was first settled in 1840 by Methodist missionaries, was incorporated as a city in 1853 and became the State capital in 1860. It has regular steamer connection with Portland, and is the trade centre of a fertile agricultural region. Its manufacturing interests are numerous and important; they include flour mills, woolen mills, fruit

evaporating and canning establishments, tanneries, brick-kilns, tobacco factories, carriage and wagon factories, and agricultural implement works. In 1914 there were 67 manufacturing plants, employing \$2,365,366 capital, and yielding products valued at \$2,845,844. The city is well built with wide regular streets and two public parks. The State capitol, built in 1875-76, is a handsome structure; among the State institutions in the city are the Institute for Deaf-Mutes, the Institute for the Blind, the insane asylum, the reform school, and the penitentiary. Under the National Banking Law of 1913 the city is in Federal Reserve District No. 12, and in 1917 had two national banks with combined capital of \$225,000, and resources of \$2,726,256. The city contains the State and a Masonic library, and a public high school established in 1892; and is the seat of the Academy of the Sacred Heart (Roman Catholic), of the Capital Business College and of Willamette University (Methodist Episcopal). At Chemawa, a few miles distant, is an Indian industrial training schools. Pop. 14,094.

SALEM, Va., town, county-seat of Roanoke County, in the Roanoke River, and on the Norfolk and Western Railroad, 51 miles west of Lynchburg. It is the centre of an agricultural and tobacco-growing region, and has a variety of manufacturing interests, including tobacco factories, tanneries, chair and carriage factories. It has a national bank (capital, 1917, \$75,000, resources \$679,573) and a State bank. The charitable institutions include two orphan asylums. There are medicinal springs in the vicinity, and it is a popular resort with Southerners. The town has a public high school, and is the seat of Roanoke College, established 1853 under the control of the Lutheran Church. Pop. 3,849.

SALEM WITCHCRAFT. See WITCHCRAFT.

SALEMA, a Pacific Coast food-fish (*Kyphosus analogus*), about 18 inches long and steel-blue in color. It is one of the rudder-fishes, allied to the croakers, and several closely related species are known as chopas, especially *K. sectatrix*, a large West Indian and Florida form, which is called "chub" at Key West, and affords good sport for the angler.

SALEMBIER, sa'lōn-byā', Louis, French clergyman and historian: b. Leers, 7 March 1849. He was educated at Cambrai and at the University of Lille, and in 1873 was ordained to the priesthood of the Roman Catholic Church. In 1873-77 he was curate at Saint James', Douai; in 1877-93 chaplain at the monastery of Esquermes, Lille, and after 1893 held the chair of church history at the University of Lille, of which he was also secretary-general after 1898. His numerous works include 'Les examens de jeunes filles dans le nord de la France' (1883); 'Cardinal Pierre d'Ailly, évêque de Cambrai, 1350-1420' (1886); 'Petrus de Alliaco' (1886); 'Le Bienheureux Edmond Campion et ses compagnons martyrs' (1888); 'Notions de psychologie à l'usage des jeunes filles' (1890); 'Un évêque de Cambrai et la découverte de l'Amérique' (1892); 'La faculté de théologie de Paris et ses docteurs les plus célèbres' (1898); 'Le grand Schisme d'Occident' (1900; 4th ed., 1906; Spanish ed., 1902; Ital. ed., 1903; English ed., 1907); 'Une nouvelle histoire du

Concile de Trente' (1902); 'L'histoire ecclésiastique et M. l'Abbé Loisy' (1908); 'Hommes et choses de Flandre' (1912), etc., and contributions to reviews and periodicals.

SALEP, a demulcent and slightly nutritive drug, consisting of the oval tubers of certain orchids (*Orchis mascula* and *O. morio*), but not of the hand-shaped tubers of *O. latifolia* and other species. These tubers are prepared in central and southern Europe and in the Levant, and are dug up as soon as the flower-stalks decay, being then in best condition; the skin is rubbed off, and they are dried, appearing as brownish-yellow, translucent and horny bodies, inodorous and insipid in taste. The powdered salep, containing a large amount of mucilage and starch, makes a nutritious jelly with water, and is a suitable food for convalescents. The *Tacca pinnatifida*, growing in the islands of the Pacific, furnishes a starch called Otaheite or Tahiti salep.

SALERATUS, aerated salt; originally potassium bicarbonate, an imperfectly carbonated salt, formerly much used in cooking. The name is now commonly applied to the commercial article sodium bicarbonate, which is used in cookery to neutralize acidity and for raising dough through the evolution of carbonic acid, and is also a common constituent of baking-powders.

SALERNO, sa-lér'nō (Ital. sāl-ēr'nō), Italy, (1) capital and seaport of the province of the same name, on the Gulf of Salerno, 32 miles southeast of Naples. It stands upon an acclivity whose summit is crowned by the ruins of an ancient citadel, and is surrounded by a massive stone wall. The Marina is a broad promenade winding for one and one-half miles along the shore. The lava-paved streets are bordered with few good buildings, the chief of which is the cathedral (1084), of Gothic architecture, adorned with a portico of porphyry and Corinthian pillars from Paestum — the ruins of which are in the vicinity. Here are the tombs of Margaret of Anjou, of Gregory VII and a sepulchre containing the bones of Saint Matthew. Other edifices are the governor's palace, theatre, hospitals, churches and convents. It also has courts of justice, a seminary and a lyceum. The chief industries are cotton and silk spinning and printing. The manufactures are glass, ceramics, macaroni, iron and leather goods, thread, linen, etc. There is excellent wine in the neighborhood. Founded by the Greeks, Salerno became an important city under the Romans, passing into possession of the Goths and later to the Lombards, who in turn were expelled by the Normans. Of the ancient city, Salernum, are still to be seen several temples, an amphitheatre and a theatre. In the mediæval period it was celebrated for its school of medicine, founded by Robert Guiscard (11th century). It was annexed to the kingdom of Naples at a later period. Pop. 48,247. (2) The province has an area of 1,916 square miles. It occupies the extremity of Campania on the Tyrrhenian Sea. It is covered with spurs of the Apennines, the chief of which are Monte Cervati, Polveracchio, Alburno and Sacro. The principal streams are the Tusciano, Mingardo and Alerto; the products are wheat, corn, flax hemp, olives, figs, wine and fruit. Pop. 571,213. (3) The Gulf

of Salerno, or Gulf of Pæstum, is a semi-circular indentation of the Mediterranean Sea, separated from the Bay of Naples by Point Campanellas. On its shores stand the picturesque and interesting towns of Amalfi and Salerno and the ruins of ancient Pæstum (q.v.).

SALERNO, School of (*Schola Salernitana*), a medical school at Salerno, Italy, famous in the Middle Ages, and important not so much for its contributions to medical knowledge as for its services in retaining the knowledge already possessed, through a period when all branches of learning were suffering decline, and forming a connection between ancient and modern medicine. As early as the 7th century some of the prelates of the Benedictine monastery at Salerno were famous for medical as well as other learning; but the school, or group of schools of medicine, which came into existence at Salerno was secular in character, the wives and daughters of the professors were often deeply learned and acted as teachers, and law and philosophy were taught as well as medicine. The school was at the height of its glory from the 9th to the 13th centuries; but from that time its decline was steady, owing to the more rapid advancement of other schools. At the zenith of the school's fame the city was known as *Civitas Hippocrates*, and it attracted many famous personages, among them William of Normandy, later Conqueror of England. The teachings of the school are fairly represented by existing works, but these are chiefly compilations founded on the teachings of Hippocrates and Galen. Such advances in knowledge as the school made were those of practical experience; and while a considerable knowledge of drugs was possessed at Salerno the treatment administered was in the main dietic. Anatomy they disregarded almost wholly. The medical school was dissolved by an edict of Napoleon in 1811, and the other departments closed in 1817.

SALES, sālz or sāl, **Saint Francis de.** See **FRANCIS DE SALES, SAINT.**

SALES. A sale is a contract by which property is transferred for a price in money. Usually the term is restricted to the sale of personal property. A sale is differentiated from other transfers of property by the fact that it is of the general or absolute ownership and by the further fact that it is for a price. A contract to sell, also called an executory contract of sale, is a contract by which the seller is to transfer property to the buyer for a price which the latter pays or agrees to pay. A contract of sale may be absolute or conditional.

To constitute a valid sale, there must be, as in all contracts, competent parties and mutual consent. In addition, there must be a subject matter to be sold and a price or consideration in money. If the price exceeds a specified amount, the contract of sale, to comply with the Statute of Frauds, must generally be in writing unless there is a part payment or some of the goods are delivered and accepted. A contract for the sale of goods not yet acquired by the seller is construed to be a contract to sell. If parties agree upon a sale, but do not fix the price, the law implies a reasonable price. The acceptance of an offer to buy or sell may be expressed or implied. Many questions of real difficulty arise in the law as to

when title passes to the buyer, and the determination of the question is important in the law of insurance, liens, etc. Where a contract of sale provides that the buyer may return the goods or pay the price, the property in the goods ordinarily passes to the buyer subject only to a defeasance by the return of the goods. Under a completed sale of goods the title passes from the seller to the buyer immediately, at the place where the contract is completed. The intention of the parties controls if the sale is of specific or ascertained goods and this may be shown either by circumstances or declarations. If by the terms of the agreement any condition is to be performed or any material act to be done, as to identify the goods, the title generally does not pass until such act is performed. A sale on trial or approval is held to be a sale upon a condition precedent and the contract is executory, the title passing only after the buyer has accepted the goods.

Conditions are distinguished from warranties generally in that the former constitute the basis of the contract on a breach of which the parties may treat the contract as terminated, whereas a warranty is merely a collateral undertaking. Warranties are of two kinds: express and implied. Formerly the harsh rule of *caveat emptor* was applied to sales, but to-day the law protects the buyer by implying various warranties in contracts of sale. Generally speaking, an implied warranty arises on sales as to merchantability, title, fitness for purpose intended and that the goods shall fill the requirements of the contract, but not as to quantity, quality or value. See **CONTRACT; WARRANTY.**

The law of sales in England and Ireland has been much simplified by the Sale of Goods Act, passed in 1893. The law of Scotland differs somewhat from that of England as to distinctions between conditions and warranties and as to the application of the Statute of Frauds in relation to sales.

An effort has recently been made in the United States to simplify the law of sales by codification, and up to June 1917 this effort had met with substantial success by the enactment of the Uniform Sales Act in no less than 18 States of the Union.

EDWARD F. DONOVAN.

SALESIAN FATHERS. See **ORDERS, RELIGIOUS.**

SALESMANSHIP, The Psychology of. The salesman like the advertiser must influence the minds of men. He must influence men to buy goods and to buy his particular goods. Serving in such a capacity a knowledge of the fundamental principles of psychology will generally add to his effectiveness. He, too, must know when and how to make use of argument, when to appeal to this motive and when to that one. He must know that in most acts of deliberation there is a point when the occurrence of an apparently insignificant idea will swing a possible customer to favorable or unfavorable action and he must respond to that situation with the suggestive word destined to close his sale.

That the sales world recognizes the importance of psychological knowledge as a part of each salesman's equipment is clearly shown

by the increasing number of books and articles intended to show how psychological fact may be used in increasing selling efficiency. Besides this there are growing up all over the country public and private sales schools and sales schools conducted by business organizations for their employees, all of which are teaching with varying degrees of success a new science of salesmanship which has as its basis the elementary principles of psychology.

The opinion is also spreading that not alone the salesman but also the man who employs him, needs psychological knowledge. The modern salesman is frequently given a thorough course of training before he is sent out to visit the customers of his firm or possible customers of his firm. Now modern educational methods rest upon a distinctly psychological basis, so he who would train men in a sales school must, like any other teacher, familiarize himself with educational psychology in certain aspects, at least, if he would make the most of the training period of his men.

Then there is another highly important application of psychology to the problems of the selling organization. The methods of selecting the sales force have been and are still in many instances of a surprisingly hit or miss character. As a new development, psychologists are being called in by certain progressive concerns to standardize their methods of selecting men. While the science of mental measurement is still in a comparatively undeveloped stage, certain facts regarding a man can be determined, with a fair degree of accuracy, by means of mental tests. For example, mental tests will give a strong indication of the general native intelligence of a man. This fact alone will not of course give complete information as to the selling ability of an applicant, but, all things considered, the greater native intelligence a man has the more likely he is to succeed in a selling position. So, when taken as additional information about an applicant, the information secured from such tests is highly valuable. Present mental tests investigations are hastening the day when more specific information about applicants for sales positions can be obtained by this method.

Psychological investigations into the problems of character traits, the judgment of such traits and their bearing upon specific lines of work are bringing out further results of great utility for the sales manager. In short, the sales organization, like all other organizations so intimately concerned with the modes of human thought and action and with the differences which we know exist between one man and his neighbor, is sure to reap increasing benefits from the modern efforts of psychologists to work out practical solutions for the problems of the human failures and misfits.

WALTER DILL SCOTT,

Director, Bureau of Salesmanship Research,
Carnegie Institute of Technology, Pittsburgh.

SALFORD, sâl'fôrd, England, a corporate town of Lancashire, adjoining Manchester, of which industrially and economically it is practically an integral portion, and with which it is connected by 16 bridges and several railroad viaducts; area, eight square miles. There are four parks, a museum and four public libraries. Pop. about 233,970. See MANCHESTER.

SALIC LAW, an ancient code or system of jurisprudence of the Salians, a tribe of Germans, who originally inhabited the country between the Meuse and the Rhine, but in the 5th century invading and conquering Gaul under Clovis, they founded the French monarchy. Their code appears to have been committed to writing about the 5th century, but according to Hallam it did not originate before the time of Clovis. The particular law, commonly called the Salic law, by which females were excluded from the throne of France, has been the subject of much dispute, and its modern application was probably fortuitous. The laws of the Salians do not appear to have usually excluded women from inheritance, and the particular law on which the exclusion rests did not originally refer to the crown, but to certain lands called Salic; and does not appear to have excluded women from the line of inheritance, but only from inheriting immediately. Its object may have been to secure the performance of military service. It remained in force from this time till the close of the French monarchy.

SALICIN, $C_{12}H_{16}O_7$, a glucoside, discovered by Leroux, existing in the bark and leaves of most varieties of the willow and poplar. Colorless, silky, crystalline needles, bitter taste, soluble in water or alcohol. Boiling with dilute acid gives glucose and saligenin or salicyl alcohol. Oxidation gives salicylic acid. Used to some extent as an anti-periodic in malarial disorders, but not as efficient as quinine. Believed by some to be valuable as a substitute for salicylic acid in the treatment of rheumatism. Dose 10 to 30 grains.

SALICORNIA, a genus of the *Chenopodiaceæ*, with about 10 species, growing in saline soils, named from the saline properties of the genus, and the horn-like branches. The three American species are curious naked, jointed plants, sometimes two feet high, with many opposite terete branches and leaves reduced to mere scales at the nodes, and appearing to ensheath the upper joints. The flowers are also reduced to pistils and stamens, and are pocketed in groups in hollows at the axils of, and behind, the upper scales. They are succulent herbs, so brittle as to be called glassworts, and grow over such large areas of marsh lands that when their usual green hue turns to red in the autumn they form great patches of vivid color. Hence the common name marsh samphire. There are five or six known species, and some of them yield soda in large quantities, especially the *Salicornia brachiata*, common along the coasts of India and those of Indian salt-lakes.

SALICYLIC (sal-î-sil'ik) **ACID AND SOME OF ITS IMPORTANT COMPOUNDS.** Salicylic acid, ortho-oxy-benzoic acid, $C_6H_4.OH.CO_2H$, occurs in the free condition in the buds of the *Spiræa ulmaria* (meadow-sweet) and as a methyl ester in the oil of *Gaultheria procumbens* (wintergreen). It may be prepared by oxidation of saligenin, a compound obtained from salicin; also by action of carbon dioxide on dry sodium phenolate at ordinary temperatures. The resulting phenyl sodium carbonate is heated for several hours in an autoclave to about 285° when it is decomposed into dry sodium salicylate; which

is dissolved in water, precipitated by a mineral acid and the acid purified by recrystallization. A very pure form is obtained by the action of alkalis on oil of wintergreen. Fine white needle-like crystals of a sweetish acid taste, slightly soluble in cold water, easily so in hot. Its aqueous solution assumes a violet hue upon the addition of a small amount of ferric chloride. It is a valuable antiseptic, the presence of even very small amounts being sufficient to prevent the decomposition of most animal and vegetable tissues or products. Formerly used extensively in the preservation of milk, beer, cider, meats, canned goods and other food products, it has more recently been condemned as injurious to the digestive organs and to the general health, and in many of the States its addition to foods is prohibited. It forms a number of crystalline salts of the metals, the most important being.

Sodium Salicylate, a white or pinkish white finely crystalline body, of a sweetish taste, soluble in water or alcohol. Often used as a preservative in place of the free acid, but the most important use is as a remedy for rheumatism, gout, etc. Dose from 10 to 30 grains.

Methyl Salicylate, $C_6H_4(OH)CO.OCH_3$, forms about 90 per cent of the oils of wintergreen and of birch. It may be made synthetically by the distillation of two parts salicylic acid, two parts methyl alcohol and one part concentrated sulphuric acid, and is then called synthetic oil of wintergreen. The compounds derived from salicylic acid that are used in medicine are very numerous, some of the important ones being Salicylanid, Saloi, Salophen, Betol, Salifebrin, Salipyrin, etc. They are used as antiseptics or as antirheumatics.

SALICYLOL, SALICYLIC ALDEHYDE, or ORTHO-OXY-BENZOIC ALDEHYDE, is a volatile oil occurring in the blossom of the meadow-sweet. May be obtained by careful oxidation of saligenin or salicin. An aromatic oil, colorless when pure but turning red on exposure to light and air, slightly soluble in water, easily so in alcohol. Used to some extent in the perfume industry, and as a flavoring substance. Said to be added to vermouthe and other liqueurs.

SALIDA, sa-li'da or sa-lé'da, Colo., city in Chaffee County, on the Denver and Rio Grande Railroad, 64 miles southwest of Colorado Springs. It is the centre of a mining region where iron, copper and silver are the principal ores; marble, onyx and limestone are also quarried in the vicinity, and agricultural, dairying and stock-raising interests are of some importance. Medicinal hot springs have made Salida a favorite health resort. It has good roads and some of the best mountain scenery in the West. The city contains large railroad shops, and two banks. The Rio Grande General Hospital is located here, and there is a public high school. The chief public buildings are the library, city hall and churches. The value of taxable property is \$3,050,000. The government is vested in a mayor and council. The municipal receipts and expenditures average \$38,000 yearly. Pop. 4,425.

SALII, sā'lī-i, priests of Mars in ancient Rome, so called from the Latin word *salire*, to leap and dance. Numa fixed their number at 12; Tullus Hostilius added another 12, who

were called Salii Collini. Their origin is thus accounted for by the Romans: In the time of Numa, Rome was desolated by a pestilence, which ceased when the gods let fall from heaven the "ancile" (a shield of a peculiar form). The soothsayers declared that this shield was the sign of the perpetuity of the Roman power, and advised that 11 others should be made similar to it, so that the true ancile could not be so easily purloined. This advice was followed. On the 1st of March every year when the Salii offered sacrifices to Mars they carried the shields about the city, clashing them together, executing warlike dances and singing the Salian hymns—ancient songs in praise of Mars and the other gods, and of distinguished men, particularly of Mamurius, who made the 11 shields. The dress of the Salii was a purple tunic embroidered with gold, and bound with a brazen belt, and a toga with a purple border. On their head they wore a high cap in the form of a cone, with a sword by their side, a spear or rod in their right hand and an ancile in their left. None but patrician youths whose parents were alive could be admitted among the Salii.

SALINA, sā-lē'na, Kan., city, county-seat of Saline County, on the Smoky Hill River, and on the Union Pacific, the Missouri Pacific, the Atchison, Topeka and Santa Fé and the Chicago, Rock Island and Pacific railways, 110 miles west of Topeka. Salina was founded in 1857 by Col. William A. Phillips; became a borough in 1873 and a city in 1880. It is governed by a mayor and eight councilmen, elected for two years. It is the commercial centre for a fertile agricultural and stock-raising region, and a valuable salt springs and gypsum quarries are in the vicinity. It has several grain elevators and exports large quantities of grain; extensive flour and paper mills and other manufacturing. Under the National Banking Act of 1913, the city is in Federal Reserve District No. 10, and in 1917 had two national banks with combined capital of \$3,796,648. There are 11 denominational churches, high school, public library and Federal court buildings. It is the seat of Saint John's School (Protestant Episcopal), Kansas Wesleyan University, Normal University and the Kansas Wesleyan Business College. Pop. 9,688.

SALINA CRUZ, Mexico, Pacific seaport in the state of Oaxaca, 12 miles south of Tehuantepec, on the Tehuantepec Railroad, of which it is the southern terminal. It had a fine harbor and steamship connection with many foreign countries. Pop. 6,138.

SALINA FORMATION, or SALINA STAGE, in North American geology an important group of beds, belonging to the upper part of the Silurian series (q.v.), named from a township in Onondaga County, N. Y., where salt springs, issuing from this formation, were discovered in the 17th century by the Jesuit missionaries. The formation, which consists mainly of shales, with frequently extensive salt and gypsum beds, comes to the surface in an east and west belt extending from Herkimer County, N. Y., westward across the Niagara River into Canada. Its erosion has caused a belt of low, often swampy, country, averaging normally from 8 to 15 miles in width, which is followed by the Erie Canal and the New

York Central and other railroads. The formation extends across Canada, where its outcrop is chiefly drift-covered, into Michigan, where it comes to an end. Southward it is known in northern Ohio (500 feet thick) at a depth of 2,000 feet below the surface, but disappears in southern Ohio. Southeastward the formation is known in Pennsylvania and Maryland. The salt of the formation is distributed in irregular lenticular beds, which, with their outer stratified shale seams, often aggregate several hundred feet in thickness. The salt is largely obtained from wells by the leaching process and the solar evaporation of the brine. The chief localities where this is carried on in New York State are Syracuse and Warsaw. The beds of this formation are for the most part non-fossiliferous and were deposited in an enclosed basin or dead sea which characterized eastern North America in late Silurian time. See PALEOZOIC; SALT.

SALINAN (sā-lē'nān) **INDIANS**, named from Salinas River. A linguistic family of North American Indians formerly inhabiting parts of San Luis Obispo, Monterey and San Benito counties, California, their habitat extending from the Coast Range to the Pacific and from the headwaters of the Salinas River to near the present Solidad. They subsisted by hunting and fishing, eking out their livelihood by means of acorns, seeds and roots. They manufactured coiled basketry, but of their general habits and customs almost nothing is known. No name for themselves as a body, for their language or for any division, either in their own or in any other Indian language, is known. They were named by Lathman (1856) and Powell (1891), and are known to have practiced cremation. The missions of San Antonio (1771) and San Miguel (1797) were established among them by the Spanish fathers, the baptisms during the mission period numbering 4,400 and 2,400 respectively. The population gradually decreased, however, and now the stock is represented by only a score of individuals.

SALINAS, sā-lē'nās, Cal., city and county-seat of Monterey County, 85 miles southeast of San Francisco, on the Southern Pacific and the Pajaro Consolidated railroads. It is situated in an agricultural and dairying region and sugar-beet culture is an important industry. In the town are machine shops and flour mills and nearby is a large beet-sugar factory. Pop. 3,726.

SALINAS, a river in California, in Monterey County, which flows north by west into Monterey Bay. It is about 150 miles long.

SALIS-SEEWIS, zā'lis-zā'vīs, **Johann Gaudenz**, **BARON VON**, Swiss poet: b. Seewis, canton of Grison, 26 Dec. 1762; d. there, 29 Jan. 1834. He went to Paris in 1779, entered the Swiss Guards and eventually became adjutant to Masséna. He lived in Switzerland after 1793, was influential in Swiss politics and until 1817 was inspector-general of the Swiss military forces. His verse was widely known and deals chiefly with nature. Several of his poems were translated by Longfellow. His collected verse appeared 'Gedichte' (1793; 12th ed., 1839).

SALISBURY, sālzb'ūrī, **Edward El-dridge**, American philologist: b. Boston, Mass., 6 April 1814; d. New Haven, Conn., 5 Feb.

1901. He was graduated from Yale in 1832 and from Yale Divinity School in 1835. After some years spent abroad in the study of Oriental languages, he was professor of Arabic and Sanskrit at Yale in 1841-54. On resigning the chair he provided an endowment for it and subsequently gave the university his Oriental library. He was president of the American Oriental Society in 1863 and for several years conducted its official organ. He was the author of a 'Discourse on Arabic and Sanskrit Literature' (1843); 'Principles of Domestic Taste' (1877); 'Genealogical and Biographical Monographs' (3 vols., 1885-88), etc.

SALISBURY, **Robert Arthur Talbot Gascoyne Cecil**, 3D MARQUIS OF, English statesman: b. Hatfield, Hertfordshire, 3 Feb. 1830; d. there, 22 Aug. 1903. He was a descendant of the great Lord Burghley, Queen Elizabeth's Secretary of State. Educated at Eton and Oxford, he was elected a Fellow of All Souls' College in 1853 and in the same year was elected member of Parliament for Stamford in Lincolnshire. He held this seat as a Conservative or "Tory" until his succession to the marquise on the death of his father in 1868. As a young man he visited Australia and New Zealand, where he worked for a time in the gold mines. While in the Commons he was known as Lord Robert Cecil, until the death of his elder brother in 1865, when he assumed the courtesy title of Viscount Cranborne. Between 1860 and 1883 he contributed 33 articles to the *Quarterly Review* on foreign affairs and weighty domestic problems. For some years, also, he wrote editorials on foreign affairs for the *London Standard*. In Parliament he quickly made his mark as a brilliant and caustic debater, active in the discussion of public measures and an uncompromising upholder of the central doctrine of conservatism, namely, that it is better to endure almost any political evil than to risk a breach of the historic continuity of government. In the Derby Cabinet (1866) he became Secretary of State for India, which post he resigned in 1867 because of the Reform bill. In 1869 he was elected chancellor of the University of Oxford, and was again sent to the India Office by Disraeli in 1874. At the close of the Turkish-Serbian War in 1876 he was sent as Special Ambassador to Constantinople, visiting the Paris, Berlin, Vienna and Rome chancelleries on the journey. He was virtually the leader of the seven plenary meetings held at the conference, which broke up in January 1877 on Turkey declaring that its recommendations of reform were inadmissible—and Europe withdrew to await the inevitable war. At the end of the Russo-Turkish War (q.v.) Salisbury became Foreign Secretary three weeks after the signing of the Treaty of Saint Stefano, when he immediately issued the famous "Salisbury Circular." This was an admirable exposition of British policy in the Near East and declared that, as the position of Turkey had been settled by the Powers of Europe in the Treaty of Paris, 1856, the signatories thereto had the right and the duty to see that no modifications of it should be made without their consent. Russia recognized that the circular meant either war or a conference, and the Berlin Congress (q.v.) resulted. Beaconsfield and Salisbury represented Great Britain at the congress.

The Gladstone campaign of 1880 brought the Liberals into office and Salisbury into opposition till 1885, when Gladstone was defeated on a budget resolution. In June, Salisbury formed his first ministry, taking the Foreign Office for himself. In February of the following year (1886) Gladstone came into power again. By July he had introduced his first Home Rule bill and had been defeated, giving place to the second Salisbury administration, the latter again combining within himself the offices of Premier and Foreign Secretary. During this administration, which lasted till 1892, several measures of importance were introduced; but Home Rule, once more placed at the head of the Liberal program, aroused, through Gladstone's influence, so wide an interest that the general elections of June 1892 once more swept the Conservatives from office and Gladstone returned with a majority of 40. Perhaps the most memorable achievement of Lord Salisbury's foreign policy was the Anglo-German agreement with regard to Africa (1890), by which the relations of Germany, Portugal and Great Britain in Africa were settled and "spheres of influence" were marked off. England obtained the protectorate of Zanzibar and gave Germany the island of Heligoland. When the second Home Rule bill was thrown out by the House of Lords, Gladstone relinquished the premiership to the Earl of Rosebery, who resigned in 1895. Salisbury then entered on his third and last premiership, from 2 July 1895 to 11 July 1902. He had to deal with the Armenian and Cretan questions, with the Chinese imbroglio, the Venezuelan boundary controversy and the South African War (1899-1902). After the 1900 elections, by which the government received a popular mandate to carry the war on "to a finish," Lord Salisbury reconstructed his cabinet and handed the Foreign Office over to Lord Lansdowne. Salisbury withdrew from public life 11 July 1902 and was succeeded as Premier by his nephew, Mr. Arthur James Balfour (q.v.). Between 1895 and 1902 the leading figure in the government was the late Joseph Chamberlain, Colonial Secretary, a former bitter antagonist of Salisbury. Throughout his long public career of 47 years, the Marquis of Salisbury was a consistent Tory. He had many intellectual gifts; an extensive knowledge, a mastery of the English language, a mordant and effective style in debate and a singular mental clear-sightedness. He saw so clearly and stated so plainly the reasons against any particular course of action that he frequently seemed to stop the way to any action at all. On occasion, too, he asserted the claims of his country with such unflinching and rigid logic as to place the other side in a position of difficulty and almost of humiliation, though he was not prepared to follow up his words by deeds, and was quite ready to accept a compromise. He harbored a strong dislike and a mistrust of Germany; he regarded the ambitions of that country as a standing menace to England. In later years he attempted to bring about a better understanding with Germany, as well as with France and Russia. From the outset of the Spanish-American War he strongly set his face against the scheme of a European coalition in favor of Spain. Of a scientific bent of mind—he was an expert electrician and a keen student of

chemistry—Lord Salisbury was entirely indifferent to public opinion and impatient of ceremonial and court functions. In his early career he rather mistrusted the masses, a sentiment gradually replaced in later years by an unswerving belief in the solid sense of his countrymen. He never played to the gallery or made flowery speeches. Yet he ultimately acquired the supreme confidence of both partisans and opponents, simply because he was above the political temptations of ordinary men.

SALISBURY, Rollin D., American geologist: b. Spring Prairie, Wis., 17 Aug. 1858. He was graduated from Beloit College, Wisconsin, and taught in the academy of that institution in 1881-83. He accepted the chair of geology there in 1884, occupying it until 1891 with the exception of 1887-88, which he spent at the University of Heidelberg. He was appointed professor of geology at the University of Wisconsin in 1891, and since 1892 has occupied the chair of geographic geology at the University of Chicago. He has been dean of the Ogden Graduate School of Science in the University of Chicago since 1899, and head of the department of geography in the same university since 1902. He has been connected with the United States Geological Survey since 1883, was connected with the New Jersey State Geological Survey from 1891 to 1910, and has been with the Geological Survey of Illinois since 1900. Besides various lesser reports, he has published a volume on the 'Physical Geography of New Jersey' (1896), and another on 'Glacial Geology of New Jersey' (1902). He has also published 'Geography of Chicago and its Environs,' with W. C. Alden (1899); 'Geography of the Region about Devil's Lake and the Dalles of Wisconsin' with W. W. Atwood (1900); a three-volume treatise on 'Geology,' with Prof. T. C. Chamberlin; 'College Geology' and 'Introductory Geology,' with the same author; 'Physiography, Advanced Course'; two smaller works on physiography: 'Elements of Geography,' with Prof. H. H. Barrows and W. S. Tower, and 'Modern Geography,' with the same authors.

SALISBURY, formerly FORT SALISBURY, Africa, capital of Southern Rhodesia, in Mashonaland, 372 miles by rail from Beira on the eastern coast, and 298 miles by rail north of Bulawayo. Its two parts are known as the Causeway and Kopje, separated by an intervening space of about three-quarters of a mile. Municipal and government offices have been established; and there are several hospitals, a cathedral, stock exchange and other buildings. Causeway is the residential district and government headquarters; the Kopje, the

business district. Gold and coal mines abound in the environs, and the plateau is suitable for agriculture. The increasing native and European population includes over 500 whites.

SALISBURY, Conn., town, Litchfield County, on the Housatonic River, and on the Philadelphia, Reading and New England Railroad, 63 miles northwest of Hartford. The town contains the villages of Salisbury, Lakeville, Lime Rock, Chapinville and Ore Hill. It was first settled about 1720 by Dutch from New York; New England settlers came to the town about 1740 and it was incorporated in 1741. The mining of the iron ore found in the vicinity soon became an important industry, and during the Revolutionary War much of the cannon, shot, etc., for the colonies was made at Salisbury. The iron mines continue to yield ore of excellent quality, and the town has several blast furnaces, also a cutlery factory, a railroad machine shop and a foundry. The region is hilly, and the township contains Bear Mountain, the highest elevation in the State. The Connecticut School for Imbeciles is located here; there is a public academy (high school), a public library, established by the Library Association in 1771; also Saint Austin's School, a Protestant Episcopal secondary school, Saint Mary's Convent, Hotchkiss School, Scoville Memorial Library. Pop. 3,522.

SALISBURY, or **NEW SARUM**, nū-sā'rūm, England, a cathedral city, the capital of Wiltshire, 80 miles southwest of London, stands on the Avon at its confluence with several smaller branches. It is built in modern style, and the streams by which it is divided are crossed by bridges which connect the various sections of the town. Most conspicuous among the public buildings is the splendid cathedral, dating from 1220, one of the grandest and most interesting specimens of Gothic architecture in England. It is in the form of a double cross, with a graceful and exquisite interior and has a spire 404 feet high. The light and airy pillars and pilasters are of Purbeck shell marble. There is some stained glass, and many interesting old monuments. Within the spacious precincts of the cathedral are the episcopal palace, the deanery and other buildings. There are three parish churches in the town, besides a Roman Catholic chapel, an artistic structure. The market-place is a central wide open space, at the southeast corner of which stands the council-house, with a handsome Doric portico. Saint Nicholas Hospital and the Poultry Cross are ancient edifices of some architectural merit. Educational and charitable institutions are numerous. Salisbury was formerly renowned for its manufactures of woollens and cutlery, but is at present chiefly important as a distributing centre. Pop. 21,476.

SALISBURY, Md., village, county-seat of Wicomico County, on the Wicomico River, and on the Baltimore, Chesapeake and Atlantic, and the New York, Philadelphia and Norfolk railroads, 84 miles southeast of Baltimore. It is in an agricultural and lumbering region, and has a large trade, exporting chiefly grain, fruit, vegetables and lumber. The most important manufacturing establishment is a yellow pine box factory, the largest in the United States; there are also saw and planing mills, flour mills and a wool carding mill. There

are (1917) two national banks, with combined capital of \$180,000 and resources of \$1,633,985. The village has a public high school established in 1872. Pop. about 6,690.

SALISBURY, N. C., city, county-seat of Rowan County, on the Southern railroad, 130 miles west of Raleigh. It was originally settled by English churchmen from Salisbury, England, and was named for that city; it was selected as the county-seat as early as 1753, but was not chartered until 1770. It is the centre of an agricultural and mining region; and contains tobacco-factories, iron foundries, machine shops, railroad workshops, tanneries and cotton and woolen mills. There are (1917) two national banks, with combined capital of \$150,000 and resources of \$1,737,757, and a State bank. The city has a public high school, established in 1899; and it is also the seat of Livingston College, established in 1882, by the African Methodist Episcopal Church, for the education of the colored race, and the State Colored Normal School. Pop. 7,153.

SALISBURY PLAIN, England, in the county of Wilts, is a high rolling plain of considerable extent and of chalky formation, from which diverge the majority of the hill chains of central and southern England. The name applies actually to the district lying between Salisbury and Devizes, although the plain may be said to extend both north and south of Salisbury. It is about 20 miles long, by 14 broad, the greater length being from north to south. Eight miles north of Salisbury upon this plain stands the historical and desolate Stonehenge (q.v.).

SALISHAN (sā'lish-an) **INDIANS** (Okinagan, *sālst*, "people"), referring specifically to the Flathead Indians, hence Salish, or Selish, of which the stock name is an adaptation. A linguistic stock of North American Indians comprising a large number of tribes or bands, most of them insignificant in numbers, the original habitat of which included an isolated area on the Oregon Coast, occupied by the Tillamook and Nestucca, who were separated from their congeners to the north by Chinookan and Athapaskan tribes; then beginning on the northern coast of Shoalwater Bay, Salishan tribes occupied the entire northwestern part of Washington, including the Puget Sound region, excepting small tracts about Cape Flattery and southward, and near Port Townsend, which were held by Chimakuan tribes. Eastern Vancouver Islands was also inhabited by Salishan tribes, while the greater part of their territory lay on the mainland opposite, including much of the upper Columbia. On the south they were hemmed in mainly by Shahaptian tribes; on the east they dwelt to a little beyond the Arrow lakes and their feeder, one of the extreme northern forks of the Columbia, where they were met by Lewis and Clark in 1804. On the northeast Salishan territory extended to about lat. 53°. In the northwest the main area did not reach Chilcat River, but the Bella-coola occupied an isolated area on Dean Inlet, Burke Channel and Bellacoola River, British Columbia. The Salashan tribes were successively visited by Juan de Fuca (1592), by the Spanish navigators who later explored the coast, by George Vancouver (1792-94) and by Lewis and Clark (1804-06), who gave the first

definite information regarding them. The fur-traders penetrated their country early in the 19th century and while Astoria, at the mouth of the Columbia, was not founded within their immediate territory, its establishment formed the beginning of the change in the primitive condition of the Salishan and the surrounding tribes which perhaps reached its climax soon after the establishment of the trading post at Victoria, British Columbia, in 1843. In their habits and customs the Salishan Indians may be divided into the coast and the interior groups. Among the former, at least, the gentile system is recognized, descent being in the male line; their houses are long communal structures, built of puncheons and designed to accommodate several families, each with its own fire. Sea products formed their chief sustenance; the canoe played an important part in their daily life; slavery was practised, and the *potlatch*, a curious institution which consisted of elaborate feasting and the distribution of personal property, held sway to such an extent as frequently to impoverish the most progressive members of the tribe. The interior Salishan tribes hunted and fished for salmon in the many streams that drain their former territory. Their houses, unlike those of the coast, were conical and constructed of poles covered with grass, pine-needles, bark and earth. The custom of head-flattening was practised particularly among the coast Salish, but, strange as it may seem, this habit did not prevail among those members of the stock now designated by the name "Flat-heads." There are many tribes or sub-tribes of the Salishan stock in Washington, Montana and British Columbia, numbering in all about 18,500 individuals, of whom about 8,000 are within the limits of the United States. The principal Salishan tribes within Canadian territory are the Lillovet, Okinagan, Thompson Indians and Lhuswap. Of the population of the Canadian divisions of the stock little reliable information is obtainable, as many tribes or tribal divisions are assembled on each of several reservations, only the combined population of which is known. These are distributed as follows: Fraser River Agency, about 5,000; Kamloop's Agency, about 2,600; Cowichan Agency, about 1,850; Okinagan Agency, 950; Williams Lake Agency, 1,900; Kootenay Agency, 50. The principal Salishan tribes or bands on reservations in the United States are:

Colville Agency, Washington.—Cœur d'Alène (Skitsuish), 474; Colville, 296; Kalispel or Pend d'Oreilles, 150; Lake or Senijextee, 307; Spokane, 653; Okinagan, 575; Sanpoil and Nespelim, 400, making a total of 12,350.

Puyallup Agency, Washington.—Chehalis, 156; Georgetown, Humptulip, Quaitso and Quinaiel, 324; Nisqualli, 107; Puyallup, 536; Skallam or Clallam, 317; Skokomish, 165; Squaxon, 118.

Tulalip Agency, Washington.—Lummi, 340; Muckleshoot (collective), 148; Port Madison, 150; Swinomish, 313; Tulalip, 488.

At Large in Washington.—Nooksak, 200; Piskwans or Wenatchi, 166.

Flathead Agency, Montana.—Charlot's band of Flatheads, 157; Confederated Flatheads, Pend d'Oreilles and Kootenai, 1,310; Lower Kalispel or Pend d'Oreilles, 53; Spokane, 77.

Since the above statistics were published many of the younger Indians have left the reservations and gone into civilized life, which has reduced those remaining on the various agencies to over 10,000 in Canada and over 8,000 in the United States. Consult Curtis, E. S., 'Indian Days of the Long Ago' (Yonkers 1914); Farrand, L., 'Basket Designs of the Salish Indians' (New York 1900); Trey, A., 'Von Salis-Seervis' (Frauenfeld 1889); Hill-Tout, C., 'British North America' (London 1907); Hodge, 'Handbook of American Indians' (Washington 1910); Pöder, G. W., 'Der Dichter Johann Gaudenz von Salis-Seervis' (Saint Gall 1863); Smet, P. J. de, 'Letters and Sketches' (Philadelphia 1843).

SALIVA. See SALIVARY GLANDS.

SALIVARY GLANDS, the glands which secrete saliva, the fluid of the mouth, or spittle. By means of these secretions the food in the mouth is brought to a pulpy state, and through the chemical action of saliva certain changes are effected in the constituents of the food. In man the salivary glands comprise three pairs, as in the mammalian class generally. Of these the largest is the parotid gland, lying in front of the ear, before the mastoid process of the temporal bone, and behind the ramus of the lower jaw. Its duct is the parotid duct, or duct of Steno. It opens into the mouth opposite the second upper premolar tooth. This gland measures from two and one-half to three inches in length, and is supplied with blood by branches from the main trunk of the external carotid artery, from the temporal, facial and other blood-vessels. The nerve supply is chiefly derived from the vegetative nervous system. The submaxillary gland, next in size, is in the lower portion of the lower jaw, above the digastric muscle. Its duct (Wharton's duct) is about two inches long, and its arteries and veins are derived from the facial and lingual vessels. The third distinct salivary gland, the sublingual, is still smaller, and is situated on the floor of the mouth, beneath the front part of the tongue. It is from one and one-half to two inches through its long axis. Its numerous ducts open on the floor of the mouth by many minute apertures. The excretory ducts of subsidiary glands in the mouth open simply on the mucous membrane of the mouth. The minute or microscopic structures of the salivary glands are composed of lobes in turn composed of lobules, each of which contains a small branch of the main duct of the gland, the subdivisions of which ultimately terminate in minute vesicles or sacs, known as acini. The salivary fluid as found in the mouth is usually mixed with the mucus secreted by the mucous or lining membrane of the mouth, and is thus rendered of viscid consistence.

Salivary glands are absent in some mammals, as whales; in some reptiles, as crocodiles; and in most fishes. In mammals alone salivary glands are present of the definite structure seen in man; but in many reptiles, as in serpents, definite (buccal) glands exist, within the inside margin of the jaws. In birds the submaxillary glands may be of large size; and in some forms, as woodpeckers, the saliva may be normally of a viscid consistence, adapted for smearing the tongue, and for thus aiding in the capture of insect-prey. Swifts, as is well

known, secrete in their salivary glands a glutinous substance of which in great part, often almost wholly, they build their nests. (See BIRDS' NESTS, EDIBLE).

When first secreted, saliva gives an alkaline reaction. During digestion this alkaline condition persists. During fasting saliva gives a neutral reaction, as also when slowly secreted, its alkalinity then being neutralized by the acid of the mucus of the mouth. Microscopically examined, saliva shows minute solid particles, probably derived from the secreting structures; and when mixed with the fluids of the mouth it contains also epithelial scales from the mouth and tongue, and mucus corpuscles, mostly from the tonsils. Freed from these, the saliva is a fluid either colorless or bluish-gray.

During mastication the flow of saliva is greatly accelerated, the presence of food in the mouth acting as the stimulus to its secretion; and different foods affect the secretion in different degrees; while mental impressions, without the presence of food, will cause saliva to flow, or will "make the mouth water." Under the action of different branches of the vegetative nervous system the secretion may be thin and watery, or thick. It is constantly subject to mental impressions, such as fear and hate and haste and fatigue. The functions or uses of saliva are both mechanical and chemical. It acts mechanically to incorporate and mix the food in the mouth, to render swallowing easier and to keep the tongue and mouth moist, so aiding articulation. (See DIGESTION).

The secretion of the pancreas markedly resembles that of the salivary glands in chemical composition, and exerts an action on the food similar in many respects, and in those forms in which salivary glands may be wanting or undeveloped the pancreatic secretion may supply the place of the salivary fluid. This action is chiefly confined to a slight action upon starches, partly converting them to sugars. Hence the slight sweetness of bread when chewed. Among invertebrates salivary glands are usually well represented. Insects and other *Annulosa* and the generality of mollusks thus possess definite structures devoted to the secretion of the salivary fluid.

Calculus concretions (salivary calculi) may form in the salivary glands, and may cause obstruction of their ducts, and necessitate the performance of an operation for their removal. Saliva would appear to become abnormal and to constitute a source of infection in hydrophobia or rabies; and syphilis is said to have been transmitted through this medium. Occasionally the elements of urine have been present in saliva—forming the so-called urinary saliva of pathologists—in consequence of diseased conditions, on the removal of which the secretion became restored to its normal composition. Milky saliva, so named from the presence of milk constituents, has also been described as a condition occurring in some parturient women. See Higier, 'Vegetative Neurology' (1919).

SALIVATION, or **PTYALISM**, a superabundant secretion of saliva, sometimes occurring in disease, but usually, in medicine, either determined locally by the use of masticating irritants or by drugs which act upon the whole system, especially by mercurial preparations.

In the last case it is accompanied by a coppery taste and by the swelling of the gums, which become of a pale rose color, except close to the teeth, where they are of a deeper red. The breath is "mercurial" and very fetid, and the teeth seem elongated and loosened. If the use of mercury is continued the swelling of the gums increases; it affects the tongue and all the salivary organs; finally, the mucous membrane is studded with small superficial ulcers covered with a white skin. Salivation is ordinarily anticipated, during mercurial treatment, by maintaining cutaneous perspiration by means of warm baths, friction and exercise. If salivation is persistent notwithstanding the use of these means, emollient gargles containing more or less of opium are used, and on the abatement of the salivation they are replaced by astringent tonics. Salivation was formerly frequent, but has become rare through modifications in mercurial treatment.

SALIX, one of the two genera of the family *Salicaceæ* (the other being *Populus*). The species are dioecious trees and shrubs, inhabiting principally the northern hemisphere and the temperate and arctic zones, and very abundant therein, especially along the banks of streams and ponds. The leaves are alternate and narrow and the small flowers, reduced to a disc bearing either stamens or pistil, according to sex, are gathered into unisexual catkins, each flower subtended by a bract. These catkins usually appear before the leaves, and are fertilized by insects, having nectaries for their attraction, the male flowers, moreover, showing large bright-colored anthers and a honey-like odor. The two-valved capsules contain numerous seeds, crowned by dense plumes of soft hairs, which enable them to float off on the wind and be disseminated by it. There are described nearly 300 species of *Salix*, which have been broadly classified as Sallows, Osiers and Willows.

Many fossil forms of *Salix* have been found. Salicin is a crystalline glucoside obtained from the bark of various species of *Salix*, and is one of the sources of salicylic acid, for which it is sometimes substituted in medical practice. See also WILLOW.

SALLEE, sā-lē', **SALI**, **SLA**, or **SULLEE**, Morocco, a seaport on the western coast of the Atlantic, 106 miles west of Fez, at the mouth of the Buregreb, formerly the great centre of Moorish piracy, immense depredations being committed from it upon European commerce. It is particularly noted for the carpets which it produces, of fine texture and bright colors. The river, which formerly admitted large vessels, is now choked up with sand. On the opposite side of the river stands Rabat (q.v.), called often New Sallee. Pop. of Sallee about 17,360.

SALLUST, sāl'üst (GAIUS SALLUSTIUS CRISPUS), Roman historian: b. Amiternum, in the Sabine district, 1 Oct. 86 B.C. (668 A.U.C.); d. Rome, 13 May 35 B.C. (719 A.U.C.) or 34 B.C. (720 A.U.C.). He held the offices of quæstor and *tribunus plebis*, attained senatorial rank, was of the Cæsarian faction in the Civil War, went to the war in Africa as prætor in 47 B.C. and after the close of the struggle at Thapsus was made commander in Africa with title of proconsul. Having returned to Rome in 45 B.C., he formed the extensive gardens celebrated as

the *horti Sallustiani*. The chief remains of his historical works are two monographs, one on the conspiracy of Catiline ('*De Conjuratone Catilinæ*'), the other on the war against Jugurtha ('*De Bello Jugurthino*'). The 'Catiline' was prepared more largely from literary sources than from the original documents which appear to have been accessible; hence it is vague and inaccurate as to chronology and fact. It aims rather at the explanation of motive and general development, and this it expresses with frequently epigrammatic neatness, but at times so sententiously as to be obscure and involved. The 'Jugurtha,' which commemorates the five years' war between the Romans and Jugurtha, the king of Numidia, or from 111 B.C. to 106 B.C., exhibits much the same features, but is based on a more thorough research and is more finished and even in style. Of Sallust's largest work, the five books of '*Historiæ*,' there are extant only four speeches, two letters and a few fragments. This work is believed to have been planned to describe the events occurring between Sallust's death, 78 B.C. and the year of Cicero's prætorship, 66. There are editions of the 'Catiline' by Schmalz (1886), Thomas (1884), Cook (1884) and Turner (1887); of the 'Jugurtha' by Thomas (1887); Schmalz (1886) and Brooks (1885); Frazer (1890), Merivale (1858), and Capes (1884). There is an English version by Poliard (1882).

SALLY-LUNN, the name given a popular teacake; so called from Sally Lunn, a pastry cook of Bath, England, who used to cry them about in a basket at the close of the 18th century. Dalmer composed a long-popular song about the cakes.

SALM-SALM, zälm-zälm, **Felix**, German soldier: b. Anhalt, Prussia, 25 Dec. 1828; d. Gravelotte, Alsace, 18 Aug. 1870. He was the youngest son of the reigning prince Salm-Salm, and became an officer in the Prussian army, but later joined the Austrian army. In 1861 he came to the United States and served during the Civil War as colonel of the 68th New York regiment. He next offered his services to Maximilian, of Mexico, whose fortunes he followed as aide-de-camp and chief of the imperial household, until the death of that emperor, when he again entered the service of Prussia. He was killed in the battle of Gravelotte during the Franco-Prussian War. His wife, **AGNES LECLERQ** (b. Baltimore, Md., 25 Dec. 1840; d. Karlsruhe, Germany, 21 Dec. 1912), an American actress, whom he married in 1862, accompanied him upon all his subsequent campaigns, and became known for her deeds of bravery and ministrations to the sick and wounded, especially during the Franco-Prussian War. Her experiences in Mexico and other fortunes of war are told by her husband in his book '*My Diary in Mexico in 1867*.' She published '*Ten Years of My Life*' (1875).

SALMAGUNDI, a dish of minced meat, seasoned with pickled cabbage, eggs, anchovies, olive oil, vinegar, pepper and similar ingredients. In an applied sense the word means pot-pourri, a medley, a miscellany.

SALMAGUNDI CLUB, a famous club of artists in New York, organized in 1871. In 1917 it had 480 resident and 234 non-resident members. The club house in West 12th street,

New York, was formerly the residence of Rogers, the sculptor.

SALMASIUS, sāl-mā'shī-ūs, **Claudius** (Latinized name of **CLAUDE DE SAUMAISE**), French scholar: b. Sémus-en-Auxois, 15 April 1588; d. Spa, 3 Sept. 1653. His father, a learned man, instructed him in the ancient languages, and then sent him to Paris to study philosophy. His edition of '*Florus*,' published in 1609, is a remarkable proof of his early erudition. In 1606 he went to Heidelberg to study law under the celebrated Gothofredus (Godefroi). On his return to France in 1610 he began to practise law, but soon withdrew to devote his whole time to critical labors and learned controversies. His mother, a Calvinist, had educated him in Protestant principles; and in 1623 he married a Protestant. Several years later he passed some time at the country-seat of his father-in-law, near Paris, where he completed his great labor on Pliny and Solinus. In 1629 his father was desirous of transferring to him his own place as magistrate, but as he openly professed Calvinism, the keeper of the seals, Marillac, refused to sanction the nomination. In 1651 he accepted the professorship which had been held by Scaliger at the University of Leyden. His friends made several attempts to recall him to France, and Cardinal Richelieu offered him a pension on condition of his writing a history of his ministry; but Salmasius declined all these offers. In 1649 Charles II of England induced him to write a defense of his father ('*Defensio regia pro Carolo I*'), which was answered by Milton's '*Defensio pro Populo Anglicano*.' (See **MILTON**). The '*Defensio Regia*' offended his republican patrons in Holland, and he accepted the invitation of Queen Christina to visit Sweden (1650). But the climate was so unfavorable to his health that he returned to Holland the following year. The most important of his works are '*Plinianæ Exercitationes in Solinum*' (1629); '*Scriptores Historiæ Augustæ*'; '*De Mutuo*'; '*De Usuris*' (1638); '*De Modo Usurarum*' (1639); '*De Fœnore Trapezitico*'; '*De Re Militari Romanorum*'; '*De Re Hellenistica*'; '*Observationes in Jus Atticum et Romanum*' (1645). Besides the classical and many modern languages, he was acquainted with Hebrew, Chaldaic, Arabic, Persian and Coptic. A collection of his 'Letters, to which his 'Life' is prefixed, was published after his death by Antony Clement (Leyden 1656).

SALMON, Daniel Elmer, American veterinarian: b. Mount Olive, N. J., 23 July 1850; d. 20 Aug. 1914. He was educated at the universities of Cornell and Paris. In 1879-84 he was investigator for the United States Department of Agriculture, after which he organized the Bureau of Animal Husbandry, acting as its chief in 1884-1906. He was head of the department of veterinary science at the University of Montevideo, Uruguay, in 1906-12. In 1898 he was president of the United States Veterinary Association. Salmon made many important investigations concerning communicable diseases of cattle and was responsible for much of the advancement in recent years of the care and inspection of cattle and the prevention of disease among them.

SALMON, sām'ôn, **George**, Irish mathematician and theologian: b. Dublin, Ireland,

25 Sept. 1819; d. there, 22 Jan. 1904. He was educated at Trinity College, Dublin, took orders in the Anglican Church and was professor of divinity at Dublin University in 1866-88. He was president of the mathematics and physics section of the British Association in 1878, and from 1888 till his death was provost of Trinity College, Dublin. He published 'Conic Sections'; 'Geometry of Three Dimensions'; 'The Reign of Law' (1873); 'Non-miraculous Christianity' (1881); 'Gnosticism and Agnosticism' (1887); 'Infallibility of the Church' (1888); 'Introduction to the New Testament' (4th ed., 1890); 'Cathedral and University Sermons' (1900), etc.

SALMON, a fish of the family *Salmonidae*, regarded as the highest type of the true or teleostean fishes. The eminent American ichthyologist, Dr. D. S. Jordan, who has made a special study of this group, speaks of it as follows: "As now restricted, this is no longer one of the large families of fishes, but in beauty, activity, gaminess and quality as food, and even in size of individuals, different members of the group stand easily with the first among fishes. The *Salmonidae* are confined to the northern regions, and north of about 40° N., are everywhere abundant where suitable waters occur. Some of the species, especially the larger ones, are marine and anadromous, living and growing in the sea, and entering fresh waters to spawn. Still others live in running brooks, entering lakes or the sea as occasion serves, but not habitually doing so. Others again are lake fishes, approaching the shore, or entering brooks in the spawning season, at other times retiring to waters of considerable depth. Some of them are active, voracious and gamy, while others are comparatively defenseless and will not take the hook. The large size of the eggs and their lack of adhesiveness, with the ease by which the eggs may be impregnated, render the salmon and trout especially adapted for artificial culture. The *Salmonidae* are of comparatively recent evolution, none of them occurring as fossils, unless it be in recent deposits. The instability of the specific forms and the lack of sharply defined specific characters may be in part attributed to their recent origin, as Dr. Gunther has suggested."

The family includes the American genera *Coregonus* (whitefish), *Argyrosomus* (ciscoes), *Stenodus* (inconnus), *Cristivomer* (lake-trout), *Salvelinus* (chars or "trout"), *Oncorhynchus* (Pacific salmon), and *Salmo* (Atlantic salmon, and salmon-trout).

Atlantic Salmon.—The body of the Atlantic salmon (*Salmo salar*), native to the rivers of both sides of the North Atlantic, is moderately elongate and but little compressed; the greatest depth is about one-fourth the total length without the caudal fin. The length of the head is about equal to the depth of the body. The mouth is of moderate size. The scales are comparatively large and number about 120 in the lateral line. The dorsal fin has 11 rays and the anal, nine rays. The color, like the form, varies with sex, age, food and condition. The adult is brownish above and silvery on the sides, with numerous small black spots often X or XX shaped, on the head, body and fins, and with red patches along the sides of the male. Young salmon (parrs) have about 11 dusky cross-bars,

besides black and red spots. Weight 15 to 40 pounds.

Its original natural range in America stretched from Greenland to Long Island Sound.

The vast abundance of salmon was one of New England's chief recommendations to immigration in colonial days. The Merrimac is reported to have been so filled with them during the spring migration that they sometimes crowded those near the banks out on dry land. Even as late as 1783 Peters reported in his 'History of Connecticut' that the "shad, bass and salmon more than half supported the province." There is no good reason to suppose that they did not originally run in the Hudson, although direct evidence that they did so in abundance is lacking. DeKay mentions that one was taken in August 1840, near Troy, N. Y., weighing 40 pounds. Long before that year, however, the New York market had ceased to be supplied from the Connecticut, and had begun to bring salmon from the Kennebec, packed in ice. In the Saint Lawrence, however, few if any salmon entering the river from the sea ever ascended as far as Lake Ontario, and the salmon inhabiting that lake and its tributaries have always, as a rule, made the lake their sea, and the limit of their downward migrations. The reason for the decline was everywhere the same—over-fishing in the rivers with seines, and the damming of the upper streams for milling or other purposes. Although Peters had recorded that in 1783 salmon "fill the Connecticut River for many days, and no finite being can number them," the Rev. D. D. Field stated in 1819 that they had scarcely been seen there for "15 or 20 years."

In respect to the habits and feeding of the salmon Dr. G. Brown Goode has written at great length. He remarks that most of the tribe are peculiarly fresh-water fishes, though several share the sea-dwelling habit, and others, like the brook-trout, descend into salt water when not prevented by barriers of temperature. "I am inclined to the view that the natural habitat of the salmon is in the fresh waters, the more so since there are so many instances . . . where it has been confined for years in lakes without apparent detriment. . . . The salmon while it remains in the sea, or in the brackish estuaries, takes particular delight in feeding on crustaceans and their eggs, small shrimps and young crabs. When in the rivers they eat but little, though they are at times eager enough for food, as testify their voracious rushes at the angler's flyhook. The absenteeism of the salmon is due principally to the dearth of desirable food in the rivers. The young fish stay in fresh water for one and frequently two years. When they pass down to the sea they weigh but a few ounces. They find congenial food and begin to grow rapidly. The broad world of ocean affords them new opportunities for adventure and self-advancement, and it is only when summoned by the duties of family life that they return within the narrow limits of the old home. When salmon live in the lakes they prey upon minnows and other small fishes, but those of the sea delight also in small crustaceans and their eggs, to which they owe the vivid color of their flesh. The habits of successive generations become hereditary traits."

It is as an adult, four years or a little more old, that the salmon enters the rivers and work their way toward their head. They have been for two or two and a half years in the sea, where and how living is little known; but the probability is that they do not go very far from the mouth of the river in which they were born. They enter as soon in the spring as the water has reached a moderate degree of warmth, and therefore appear in southern rivers much earlier than in northern ones. They are in magnificent condition, and make their way upstream with extraordinary persistence and force, overcoming swift rapids, climbing cataracts and leaping unbroken falls as much as 12 feet high; but only the strongest can accomplish so great a feat, and sometimes only after repeated efforts. It is during this early advance that the angler seeks the streams where they are running and throws his line for the grandest sport afforded by fly-fishing in fresh waters. Having reached, as near as time or circumstances permit, to the sources of the stream the eggs are poured out in vast quantities by the females, and simultaneously the males void their milt, so that impregnation takes place at once. This takes place in our rivers late in October or in November. The development of the embryo proceeds for a time, but soon is checked by the winter cold, so that it does not burst the shell of the egg until the next April or May.

At this time the embryo salmon has a slender half-transparent trunk, less than an inch in length, carrying, suspended beneath, an immense ovoid sac—the “yolk-sac”; for about six weeks after hatching it hides in crevices among stones, keeping up an incessant fanning with its pectoral fins. During this period it takes no food, but is supported and nourished by the yolk-sac, the substance of which is gradually absorbed into the rest of the body, and not until the sac has nearly disappeared does the salmon really look like a fish and begin to seize and swallow food. It now puts on a mottled coat, with several heavy dark bars across its sides, and bright red spots, larger and fewer than those of a trout, and looks therefore very unlike the adult salmon but much like a young trout. In this stage it is termed, in Scotland and England, a “parr,” and it was formerly thought to be a wholly different species from salmon.

The parr stage lasts a year or two in British rivers, and the few observations made in America indicate that it is more likely two years than one in our rivers. The parr, at first but little over an inch in length, is provided with good teeth and a good appetite, and beginning to feed at a season of the year when the water is almost crowded with small insects and other more minute creatures, it grows rapidly, probably increasing its weight 30 or 40 times the first summer. In two years it reaches the length of six or eight inches, and its bright red spots and dark bars have given place to a silvery coat like the adult salmon. It is now termed a “smolt” and is ready to go to sea, which it does with little delay, and passes out beyond the range of man’s observation, but to a region where it finds a rich feeding-ground and rapidly increases in size. In northern rivers, those of New Brunswick and beyond, as in those of northern Europe, the salmon returns from the sea when it has attained a weight of two to six pounds, and is

then termed a “grilse.” In the rivers of Canada, in general, grilse occur in great numbers, coming in from the sea at a later date than the adults, but ascending like them to the upper waters, mingling freely with them, rising to the same fly, and caught in the same weirs. In our rivers grilse are seldom seen; yet it by no means follows from this that our salmon do not pass through the same phases of growth, or that the growth is more rapid, but merely that when in the grilse stage they generally lack the instinct that impels their more northern relatives to seek fresh water.

Of the characteristics of grilse, as ascertained in the rivers they frequent, it will be sufficient to say that they exhibit to a great degree the characteristics of the adult; that the main external differences are a shorter head, slenderer form, and a difference in the color and markings; that they are remarkably active and agile, leaping to great heights: that the male is sexually well developed and mates with the adult, but that the female is immature, and that, like the adult, they abstain from food and consequently lose flesh during their stay in fresh water.

Pacific Salmon.—There are five species of salmon on the Pacific Coast which belong to the genus *Oncorhynchus*, namely, the chinook or quinnat salmon (*O. tshawytscha*), the red or blueback salmon (*O. nerka*), the humpback salmon (*O. gorbuscha*), the silver salmon (*O. kisutch*), and the dog salmon (*O. keta*). The features which separate the Pacific salmon from the Atlantic salmon are not marked, and consist chiefly in a larger number of rays in the anal fin, and more branchiostegals, gillrakers, and pyloric cœca.

The characters noted in the following key will usually be sufficient to distinguish the different species of Pacific salmon:

Quinnat Salmon.—Scales in longitudinal series from 135 to 155, averaging about 145; pyloric cœca 140 to 185; gillrakers comparatively short and usually 23 in number, 9 being above the angle; rays in anal fin 16; branchiostegals 15 to 19. Body robust; head conic; eye small; caudal fin deeply forked. Color above dusky, sometimes with bluish or greenish tinge; sides and belly silvery; head dark with metallic lustre; back and the dorsal and caudal fins with numerous round black spots.

Blueback Salmon.—Scales in longitudinal series about 130; pyloric cœca 75 to 95; gillrakers comparatively long and 32 to 40 in number; rays in anal fin 14 to 16; branchiostegals 13 to 15. Body rather slender; caudal fin much forked; anal and dorsal fins low. Color, above bright blue, sides silvery, no spots.

Humpback Salmon.—Scales very small, 210 to 240 in longitudinal series; pyloric cœca very slender, about 180 in number; gillrakers short, about 28, 13 being above angle; anal rays 15; branchiostegals 11 or 12. Color bluish above, silvery on sides; hind part of back, adipose fin, and tail with numerous black spots, largest and of oblong form on tail.

Silver Salmon.—Scales large, 125 to 135 in longitudinal series; pyloric cœca comparatively few and large, 45 to 80 in number; gillrakers long and slender, 23 in number, 13 below angle; anal rays 13 or 14; branchiostegals 13 or 14. Body long; head short, conic; snout blunt; eye small; fins small, caudal deeply forked. Color

bluish green, sides silvery, finely punctulated; spots few and obscure on head, back dorsal, adipose dorsal, and upper rays of caudal.

Dog Salmon.— Scales of medium size, 138 to 155 in lateral line; pyloric cœca 140 to 185; gill-rakers short and few, 9 above and 15 below angle; 13 or 14 rays in anal fin; branchiostegals 13 or 14. Form of quinnat, but head longer and more depressed. Dusky above and on head, paler on sides; very fine spots on back and sides, often wanting; tail plain dusky or finely spotted, with black edge; other fins blackish.

These salmons are the most important group of fishes entering the rivers of North America. The steelhead (*Salmo gairdneri*), technically a trout, but popularly regarded as a salmon, also inhabits the waters of the Pacific coast and adds to the importance of the salmon tribe.

In recent years the annual catch of salmon in the Pacific States and Alaska has been over 100,000,000 pounds. In 1899 the quantity of salmon canned was 2,450,000 cases of 48 one-pound cans. The weight of the fresh fish represented by this pack together with the large quantities sold, fresh, salted and smoked, was about 175,000,000 pounds, with a value, as placed on the market, of nearly \$9,000,000.

The quinnat is known in various parts of its range as Chinook, king, Columbia, Sacramento or tyee salmon, and is the most important of these salmons. It is not only superior in food qualities, but attains a vastly larger size, has a wider geographical range and a greater commercial value. When fresh from the ocean it is a very handsome, well-formed fish, greatly resembling the Atlantic salmon, although less symmetrical and graceful. It is of a uniform rich red color, becoming paler or streaked upon the approach of the spawning season. Its value for canning purposes is largely enhanced by the persistence of the red color of the meat after cooking. In size no other salmon in the world compares with it. In the Yukon River, Alaska, it reaches a weight of over 100 pounds. Farther south, it runs smaller, although in the Sacramento individuals weighing 50 or 60 pounds are not rare; 22 pounds is a fair average weight in the Columbia River and 16 pounds in the Sacramento. Its known range is practically from Monterey Bay (latitude $36\frac{1}{2}$) to the Yukon River, but it probably ranges farther north. While in the sea, quinnat salmon probably do not wander very far from the mouths of the rivers they have left, and for this reason usually return to spawn in the rivers in which they were hatched. They prefer the larger rivers, like the Sacramento, the Columbia, the Nushagak and Yukon. They are very persistent in ascending the rivers to spawn, and have been seen crowding up the rivulets which form the headwaters of the Sacramento until nearly half their bodies were exposed to the air. No matter how far the headwaters of a river are from the ocean, some of the salmon will press forward until stopped by impassable obstructions or water too shallow for them to swim in. On reaching the headwaters they remain for a week or two before proceeding to the spawning grounds. Their rate of progress varies with the season, and probably depends to a great extent on the rainfall and the state of the river, rain, roily water or high water always hastening their progress.

When they first come from the ocean the sexes are almost identical in appearance, but as the time for spawning approaches a difference is noticed between the males and the females, which during the spawning season becomes more marked. The fully developed ova of the female give her a round, plump appearance, while the male grows very thin. His head flattens, the upper jaw curves like a hook over the lower, the eyes become sunken; large, powerful, white, dog-like teeth appear on both jaws and the fish acquires a gaunt and savage appearance. As soon as they reach fresh water their appetites grow less, their throats begin to narrow, and their stomachs to shrink. This does not at first entirely prevent them from feeding, but it changes them enough to enable them to overcome the temptation to return to their well-stocked feeding-grounds in the ocean, and the longer they remain in fresh water the greater are the changes, and the desire to turn back for food is correspondingly lessened. This change comes about gradually, increasing day by day from the time they leave tidewater until at the near approach of the spawning season their throats and stomachs become entirely incapacitated for receiving food, and the desire and ability to feed leave them entirely. The great reserve of flesh and blood which they bring with them from the ocean enables them to keep the vital organs active until their mission up the fresh-water streams is accomplished.

Quinnat salmon, like all the Pacific salmon, do not return to the sea, but die on or near their spawning grounds. After spawning they rapidly deteriorate, the flesh shades off to a light, dirty pink and they become foul, diseased and much emaciated. Their scales are wholly absorbed in the skin, which is of a dark olive or black hue, and blotches of fungus appear on their heads and bodies, and in various places are long white patches where the skin is partly worn off. Their fins and tails become badly mutilated, and in a short time they die exhausted.

The spawning season of the quinnat varies in different rivers and, considering the entire coast, lasts at least six months. In July the summer run is spawning at the headwaters of the McCloud and Sacramento rivers in California; in August and September, farther down these rivers. In October the fall run has begun in the McCloud and below, and this run continues spawning through November into December. In the Columbia the spawning begins at the headwaters in June; at Clackamas, 125 miles from the mouth of the river, it begins about the middle of September and continues until November. A few days before they are ready to spawn the salmon hollow out elongated cavities with their heads and tails in the gravel beds of the river where there is some current, and here in due time the eggs and milt are deposited. The eggs drift into the crevices in the pile of stones thrown up below the hollow, sink to the bottom, and remain in that protected position during incubation; here, also, the young remain until the umbilical sac is absorbed. The eggs and young are liable to destruction by freshets, but are comparatively safe from other injurious influences. The quinnat is not so prolific as the Atlantic salmon, 300 or 400 eggs to each pound weight of the parent fish being a fair average.

As the salmon ascend the rivers they are caught by gill nets, fyke nets, pounds, weirs, seines, wheels and other devices, but in the Sacramento and Columbia the greater numbers are caught with gill nets drifting with the current or tide as they head upstream. In the rivers they are comparatively safe from enemies except otters, ospreys and fishers, but immense numbers are destroyed at the mouths of the streams by seals and sea-lions. The quinnat has been introduced into Japan, Australia, New Zealand and Europe, but efforts to acclimatize it on the Atlantic Coast of the United States have so far been unsuccessful.

Considering the entire west coast the blueback salmon (*O. merka*) is probably more numerous than all the other salmon combined. It is known in different regions as blueback, redfish, red salmon, Fraser River salmon and sock-eye or saw-qui. It ranks next to the chinook in commercial value, being especially important in the Columbia and Fraser rivers and in Alaska. For canning purposes it is but little inferior to the chinook, the color of the flesh being a rich red, which persists after canning. Large quantities are canned in British Columbia and in Alaska, particularly on Kadiak Island, and its commercial importance to that territory is indicated by the fact that nearly half of the entire salmon pack of the world comes from Alaska and the majority of the fish there canned are of this species. Comparatively few red salmon are sold fresh in the United States. It is next to the smallest of the salmon, the maximum weight being about 15 pounds, but it rarely weighs over eight pounds and the average is scarcely five pounds. In various lakes this fish weighs only half a pound when mature, and is called the little redfish. It ranges from Humboldt Bay, California, to the far north, but in general it ascends only those rivers which rise in cold, snow-fed lakes. Except in the breeding season the color of this fish is a clear bright blue above, with silvery sides and belly. At the spawning period the back and sides become red, and the male develops an extravagantly hooked upper jaw.

The humpback salmon is the smallest of the Pacific salmon; its average weight is only five pounds, and it rarely reaches 10 pounds. Its range is from San Francisco probably as far north as the Mackenzie River, and it is also common on the Asiatic Coast. In food qualities the fresh-run humpback is scarcely inferior to any other salmon. While the flesh has a very fine flavor, it is paler than that of other red salmon, and the species has consequently been neglected by canners; but it is probable that it will eventually be utilized for canning purposes, and its excellent qualities when fresh are undoubtedly destined to give it a great commercial value. Its chief consumption now is by Alaskan natives. The humpback salmon generally seeks the smaller streams for the purpose of spawning and deposits its eggs a short distance from the sea, sometimes within only a few rods of the ocean. At Kadiak Island, Alaska, where it is often very abundant, it arrives in the latter part of July, the run continuing only a few weeks. Spawning takes place in August.

The silver salmon is also known as silver-sides, skowitz, kisutch, hoopid salmon, and coho

salmon. It is a beautiful fish, having a graceful form and a bright silvery skin. Its flesh, which is fairly good, usually has a bright red color, but as this fades on cooking it is not highly regarded for canning purposes, though large quantities are thus utilized. Its average weight in the Columbia and Puget Sound is eight pounds, but in Alaska it averages nearly 15 pounds. Its range is from San Francisco to northern Alaska, and as far south on the Asiatic Coast as Japan. It runs up the rivers to spawn in fall or early winter, when the waters are high, but usually does not ascend great distances from the ocean.

The dog salmon is the least valuable of the Pacific salmon, although it is dried in large quantities by the Alaskan natives. Its average weight is 12 pounds and the maximum is about 20 pounds. It is found from San Francisco to Kamchatka, being especially abundant in Alaska. The enlargement and distortion of the jaws give the species a very repulsive look, and the large teeth give to it its common name. When just from the ocean, the flesh has a beautiful red color and is not unpalatable, but it deteriorates rapidly in fresh water. It spawns in shallow rivers and creeks. Larger quantities are utilized in Puget Sound than elsewhere in the Pacific States, and it is also used considerably by the natives of Alaska.

The Steelhead.—Another anadromous salmonoid fish found on the Pacific Coast, popularly regarded as a salmon, is the steelhead (*Salmo gairdneri*), known also as hardhead, winter salmon, square-tailed trout, and salmon trout. It resembles in form, size and general appearance the salmon of the Atlantic Coast, and is distinguished from other Pacific Coast salmon by its square tail, its small head, round snout, comparatively slender form, light-colored flesh, and its habit of spawning in spring. It is more slender than the quinnat and consequently not so heavy for its length. Its average weight in the Columbia is about 10 pounds, although it sometimes reaches 30 pounds. Its range is very extended, reaching from the southern coast of California to the Alaska Peninsula, and is found in almost all the streams of the Pacific States which empty into the ocean. It begins to enter the Columbia in the fall, and is then in prime condition. Like the chinook, the steelhead ascends rivers for long distances, and it has been found almost as far up the tributaries of the Columbia as the ascent of fish is possible. As the greatest quantities of steelheads are caught in the spring, when they are spawning and are in a deteriorated condition, they are not generally esteemed as food; but when they come fresh from the sea and are in good condition, their flesh is excellent. As the demand for salmon has increased, steelheads have been utilized for canning, and they have formed a noteworthy part of the canned salmon from the Columbia River for a number of years past, as well as from the short coast rivers of Washington and Oregon. Their consumption fresh has been increasing yearly and considerable quantities have been sent to the Eastern States in refrigerator cars.

Artificial Propagation.—The first steps in an effort to restock with salmon the rivers of the eastern coast were undertaken by Massachusetts and New Hampshire about 1865. At

first eggs were obtained from Canada, but this source was cut off, and the authorities were compelled to attempt to get eggs by capturing salmon in the spring at the mouth of the Penobscot River, in Maine, and keeping them alive and well until they spawned in November. After some experimenting a few live salmon were safely caught and carried in floating cars to Craig Brook, near the mouth of the Penobscot, where ponds and hatcheries fed by a clear stream had been prepared for them. The fish thrived; year by year quantities of eggs were obtained and despatched to other places to be hatched. In 1889, however, the Craig Brook station was acquired by the United States Fish Commission and enlarged into a regular establishment for the rearing of fry, on an extensive scale, to the age of six or seven months. Later other establishments were opened for the rearing and distribution of the landlocked salmon. Still more extensive operations in salmon culture have been undertaken on the Pacific Coast to replenish the rivers of California and the Columbia basin, from 40 to 50 millions of fry (principally quinnat) are annually being artificially hatched, reared and placed in the headwaters of the various rivers. For treatment of the eggs and fry, see FISH-CULTURE. See also FISHERIES.

SALMON, a river in Idaho, which rises in Custer County, flows north and west into Snake River, 40 miles south of Lewiston. Its course is irregular; its total length is about 450 miles.

SALMON DANCE, among the American Indians, a dance of the Yurok, Karok and other tribes, held in the early spring on the Pacific Coast when the salmon begin to run up the rivers. No one is permitted to catch a salmon before the dance, nor for 10 days afterward.

SALMON-TROUT, a name applied to several distinct species of *Salmonidæ*: in the eastern United States to the great lake trout (*Cristivomer* or *Salvelinus namaycush*) which resembles the true chars or trouts except for the crested and toothed vomer bone and prominent teeth on the base of the tongue. The color varies greatly, but is usually dark gray with numerous well separated rounded spots of lighter gray. This species reaches a length of upward of three feet and has been known to attain a weight of 125 pounds. It is especially characteristic of the Great Lakes, but is found in fresh waters from Maine to Vancouver and northward to Alaska. Except when spawning in the autumn they live in the deeper waters

of the Lakes and are extremely voracious. Next to the whitefish the lake-trout is the most important food-fish of the Great Lakes, and is caught chiefly by means of extensive gill nets operated by tugs. In order to maintain the fisheries many millions of eggs are now hatched artificially, both by the United States and by the Michigan Fish Commissions. In the West the steelhead salmon (*Salmo gairdneri*) and related species are sometimes known as salmon-trouts. The steelhead resembles the rainbow trout (q.v.), but is very much larger, has small scales and a larger mouth. It is abundant in nearly all of the rivers of the Pacific Coast, from California to Alaska, and is caught in considerable quantities for canning, and when captured in the fall immediately after leaving the sea, is esteemed as a fresh fish. The common Atlantic salmon (*Salmo salar*) also sometimes receives the name of salmon-trout, as in the Gulf of Saint Lawrence. The salmon-trout of Europe (*Salmo trutta*), also known as bull-trout and sea-trout, occurs in the Baltic Sea, about the British Isles and along the coast of France, and enters the rivers emptying into these seas. Its life history resembles that of the common salmon, with which it readily hybridizes. See SALMON; TROUT.

SALMONIDÆ, a family of highly-organized fresh-water and anadromous fishes of the northern parts of the world, which includes the salmon, salmon-trout, whitefish, grayling and their relatives. See SALMON.

SALOL, Phenyl Salicylate, $C_6H_5OHCOOC_6H_5$, is obtained by heating salicylic acid or sodium salicylate with phenol or sodium phenate, in the presence of condensing agents, such as phosgene, phosphorus trichloride, phosphorus pentachloride, or phosphorus oxychloride. It has also been prepared by heating salicylic acid at 160°–240° C. for a long time in the absence of air.

Salol is a white crystalline powder. It melts at 42°–43° C., readily dissolves in chloroform, ether, alcohol and many other organic solvents, but is almost insoluble in water. The compound was introduced into medicine by Nencki in 1886. When taken internally it passes unchanged through the gastric juice of the stomach, but upon reaching the small intestine it is slowly hydrolysed into phenol and salicylic acid by the alkaline pancreatic juice. Salol is therefore a good intestinal antiseptic, and has been extensively used in the diseases of the intestinal canal. It is a valuable substitute for salicylic acid in the treatment of rheumatism; and a mixture of salol and camphor has been recommended as a local anesthetic. Salol has also been employed for the coating of pills and capsules containing solids or liquids. The salol coating renders them insoluble in the stomach and permits their passage into the intestines.

V. S. BABASINIAN,
Lehigh University.

SALOME, sa-lō'mē, a Hebrew female name, common in Palestine in the days of Jesus Christ. The most notable bearer of it was the granddaughter of Herod the Great, born 10 A.D., who married her uncle, Philip the tetrarch, and is known in history as Salome, the dancer. She appears in the gospel as a young girl, who is instigated by her mother Herodias to ask of Herod Antipas the execu-

tion of Saint John Baptist. Josephus says she first married Philip the tetrarch, son of Herod the Great and Cleopatra, and afterward Aristobulus, son of Herod, King of Chalcis, her cousin-german, by whom she had several children. The name was also borne by Zebedee the mother of James the Elder and John the Evangelist, one of those women of Galilee who attended Jesus in his journeys and ministered to him. (Matt. xxvii, 56). She asked of Christ for her sons a special place of honor in his kingdom (Matt. xx, 21); and was a witness of the crucifixion (Mark xv, 20). Some infer, from comparing Matt. and John xix, 25, that she was a sister of Mary the mother of Jesus.

SALOMON, Haym, American patriot and financier: b. Lissa, Poland, 1740; d. Philadelphia, Pa., 6 Jan. 1785. But meagre details are preserved of his early career, but his record as an American patriot and his services in aid of the government in Revolutionary days are well known. He was called "the good Samaritan" by S. H. Gay in his life of James Madison, and is referred to by Madison as rejecting all recompense for the pecuniary help bestowed. He was a prisoner in New York in 1775, and in 1778 escaped to Philadelphia. There acquiring wealth as a banker, he freely loaned to Robert Morris over \$350,000. He negotiated all the war subsidies from France and Holland and when Continental money was withdrawn, causing suffering among the poor of Philadelphia, he distributed \$2,000 in specie to relieve distress. The large indebtedness of the government to Haym Salomon was never repaid to him nor to his heirs and has been the subject of some discussion. It was favorably reported to the United States Senate in 1850. Although the amount of public securities and Revolutionary papers filed in the register's office, Philadelphia, 15 Feb. 1785 reached \$353,744, the inroads of the British army in 1814 destroyed every record in relation to the vouchers. On 24 Feb. 1893 a bill was presented to the House that a gold medal be struck off in recognition of Haym Salomon's services, his heirs to waive all claims for indemnity; but the measure, although reported favorably, was too late for consideration. Consult 'A Sketch of Haym Salomon, from an unpublished manuscript in the papers of Jared Sparks'; Adams, H. B., in 'Publications of American Jewish Historical Society, No. 2' (1894).

SALOMONS, Sir David Lionel Goldsmith-Stern, English electrical engineer: b. 28 June 1851. He was mayor of Tunbridge Wells in 1895, has been vice-president of the Institution of Electrical Engineers, and has published 'Electric Light Installations'; 'Photographic Formulæ'; and various monographs on electrical topics.

SALON, sā-lôn', **The Paris**, (1) the large gallery in the Louvre, in Paris, in which art exhibitions were formerly held; (2) a name given the annual art exhibition in Paris; (3) the leading galleries where modern artists exhibit their works; (4) an apartment for the reception of company, in the plural, fashionable assemblages, or circles of fashionable society. See **PARIS**.

SALONICA, or SALONIKI, the ancient Thessalonica, a sea-port of Greece, in the Department of Macedonia, which was taken from

the Turks at the close of the Balkan wars (q.v.) in 1913 and passed into the possession of Greece. Until then Salonica had been the capital of a Turkish vilayet of the same name. Situated on the Gulf of Salonica, in the Ægean Sea, 315 miles southwest of Constantinople, the town occupies a fortified slope, and, surrounded by stately cypresses and lofty white walls, ascends from the shore in triangular form. Its architecture is characteristically Oriental, the early Christian churches having been converted into mosques. Chief of these is Saint Sophia, similar to the celebrated mosque of that name in Constantinople, on a smaller scale, but beautiful; the church or mosque of Saint George (with walls 20 feet thick), which contains early Christian mosaics dating from 400 A.D.; Saint Demetrius, destroyed by fire in 1917, had a fine interior; and various others, besides Greek churches and Jewish synagogues. The numerous antiquities include the Citadel, or ancient Acropolis, with its seven towers, called by the Turks *Yedi-Kuleh*, containing a triumphal arch which dates from the time of Marcus Aurelius; the Propylæum of the Hippodrome, a splendid Corinthian colonnade of five pillars; the triumphal arch of Augustus, commemorating the battle of Philippi; the arch of Constantine, etc. There are large bazaars, and aqueducts bring water from the distant hills to the city. Saloniki, however, was also characterized by much squalor and miserable quarters, though considerable improvements have been introduced under Greek rule. Since the construction of various railway systems and harbor improvements, the trade, already considerable, has increased. The exports consist of corn, cotton, wool, tobacco, silk cocoons, opium, wine, brandy, skins, antimony and timber; the imports, of sugar, flour, coffee, coal, iron and hardware, petroleum, salt, rice, glass, etc. Great Britain had the largest volume of trade before the war; next in importance were Italy, France, Austria-Hungary and Turkey. Salonica (formerly *Therma*) is mentioned in historical annals, in connection with Xerxes' march through Greece. It was refounded by Cassander in 315 B.C. Saint Paul preached here and addressed two of his epistles to the converts of this place (Thessalonians). During the Roman-Macedonian wars it figured as the chief station of the Macedonian fleet. After the civil wars it became the first city in Greece. It was a seat of the Christian Church at a very early period. During the barbarian invasions, it was the most important stronghold and place of defense of the Eastern empire. In mediæval times it was taken (904) by the Saracens; (1185) by the Sicilian Normans; (1430) by the Turks. The population, about 165,000, is mainly composed of Greeks, Turks, Jews, Bulgars, Serbs, Italians and French.

During the first Balkan war Salonica surrendered to the Greeks with a Turkish army of 29,000 under Hassan Tahsin Pasha on 8 Nov. 1912. In the course of the European War Salonica was the scene of violent international complications owing to the failure of Greece to come to the assistance of Serbia against Bulgaria, as stipulated by treaty. On 18 Aug. 1917 a great fire broke out in the town and burnt for two days. Quite two-thirds of Salonica proper was destroyed and 100,000 persons rendered homeless. All the banks, busi-

ness premises, hotels and most of the theatres were reduced to ashes. Only the bare walls of the old Byzantine Church of Saint Demetrius remained standing, while most of the other churches escaped destruction. See GREECE; VENIZELIS, E.; WAR, EUROPEAN.

SALONICA, Gulf of (ancient Sinus Thermaicus), is the extreme northwestern arm of the Ægean Sea, between the peninsula of Chalcidice and the coast of Thessaly. Its length is about 85 miles; breadth, 50 miles, and consists of two distinct parts—one wide, extending from the southeast to northwest; the other narrow, from southwest to northeast.

SALPA, a genus of free-swimming ascidian of the order *Thaliacea*, and the family *Salpidae*. They are met with as single or solitary organisms and as aggregate or compound collections, the so-called "salpa chains," but these are states of the same species. The solitary salpa produces by budding from a process termed the stolon, a long chain of aggregated embryos, which become the salpa chain. The individuals of this compound chain have the power of producing, by means of eggs, new solitary salpæ. This is one of the instances brought forward by Steenstrup in illustration of his views of the alternation of generations. The entire life-history, however, is not so much one of an alteration of generations as of a process of budding (asexual), alternating with reproduction by means of eggs (sexual). Thus, the first salp produces aggregate salps which are unlike itself, but the aggregated salps produce solitary salps unlike their parents, but resembling their grandparents. Each salpa is of oval or quadrate form, with an aperture at either extremity. Locomotion is effected by the expulsion of water from the posterior aperture, and the salpa-chains thus swim over the surface of the ocean. The principal organs of the body are compacted to form the so-called "nucleus." The salpæ are beautifully transparent and colorless and often phosphorescent. They abound in the waters of the Gulf Stream and in the Mediterranean.

SALSIFY, sāl'sī-fī, a biennial composite (*Tragopogon parvifolius*), sometimes attaining four feet in height. The genus is popularly known as Goat's Beard, because of the long silky beard or poppus of the seeds. It grows wild in the south of Europe, but is cultivated as a vegetable. It has narrow grass-like leaves and solitary showy purple heads of ligulate florets, the involucre consisting of lanceolate leaflets much longer than the florets. The flowers close before noon. The fruits are plumed and float through the air like those of a dandelion. Salsify is hardy and has a very long tapering tap-root, white and fleshy, and with a flavor resembling oysters, whence it is sometimes called vegetable oyster or oyster plant. Black salsify (*Scorzonella hispanica*) comes from Spain and is closely allied to the true salsify. It has a root like that of *Tragopogon*, except that it has a blackish skin. The leaves are undulate and the flowers yellow. The plant was once used for snake-bites.

SALSILLA, the common name of several species of the amaryllidaceous genus *Bomarea*, which produce edible tubers. Some are cultivated in greenhouses for their large gorgeously spotted flowers, borne in cymes on twining

stems, and *B. edulis* is cultivated in the West Indies as a vegetable, its fleshy roots being also a diuretic and sudorific.

SALSOLA, a genus of the *Chenopodiaceæ*, with about 50 widely distributed species growing in saline soils, or on seashores, popularly known as saltwort. The small, axillary flowers are apetalous, but have a five-parted calyx, which in fruit encloses the utricle, and has a broad, horizontal, membranous wing. A maritime species (*S. kali*), the prickly saltwort, is a familiar spiny annual, its decumbent branches spreading from the central tap-root so as to form large rosettes on the sand. The closely-set rigid leaves radiate in all directions; they are small, awl-shaped and succulent, the mid-vein ending in a strong prickle. It is a widely diffused species and like some other plants of the same family, was formerly collected and burned for the impure carbonate of soda found in its tissues. Lumps of the fused ash were an important article of commerce, called barilla (q.v.), and yielded about 50 per cent of soda, being the original source of that chemical. Salsola was also a component of the "sope," mentioned by Jeremiah. To this genus also belongs the Russian thistle (q.v.).

SALT, sält, Henry Stephens, English biographer: b. Nynce Tal, India, 1851. He was educated at Cambridge and subsequently engaged in literary work and social reform. He has been honorary secretary of the Humanitarian League from its founding in 1891 and editor of *The Humanitarian* and *The Humane Review*. He has published 'Life of James Thomson'; 'Life of Thoreau'; 'Richard Jefferies: a Study'; 'Shelly: Poet and Pioneer'; 'Tennyson as a Thinker'; 'Animals' Rights'; 'The Logic of Vegetarianism', etc.; and edited 'Songs of Freedom'; 'Kith and Kin' (poems of animal life), and works by Godwin, Thoreau, Melville, etc.

SALT, SIR Titus, English manufacturer: b. Morley, Yorkshire, 20 Sept. 1803; d. 29 Dec. 1876. He was the first to introduce the manufacture of cloth from the wool of the alpaca into England. The model village of Saltaire (q.v.), three miles from Bradford, on the river Aire, was built in 1853 for the workmen engaged in his factories. He was a member of Parliament in 1859 and in 1869 was made a baronet. Consult Balgarnie, 'Life of Sir Thomas Salt' (1877); Holroyd, 'Saltaire and its Founder.'

SALT, the common name for sodium chloride, NaCl. It occurs native in large quantities and it may also be prepared by neutralizing hydrochloric acid with sodium carbonate or with sodium hydrate and evaporating the solution. It is soluble in water, its solubility at the boiling point being only a little greater than the solubility at the freezing point. It is insoluble in absolute alcohol and in aqueous alcohol it dissolves to a greater or lesser extent, according to the proportion of water present. Salt crystallizes in the isometric system, usually in cubical or pyramidal forms, though octahedra also occur. Its solution is neutral to test papers and a saturated solution, when cooled to some degrees below the freezing point of pure water, deposits a hydrate having the composition NaCl + 2H₂O. When cooled to 9° F. below zero, a saturated solution throws down the hy-

hydrate $\text{NaCl} + 10\text{H}_2\text{O}$. Pure salt is ordinarily white in color, but it is transparent and colorless, with an ice-like lustre when crystalline. It is slightly hygroscopic and when heated it decrepitates markedly. It melts at about 1500°F ., and it may be vaporized by raising it to a strong white heat in a current of nitrogen gas. Its specific gravity is 2.16 and its specific heat is about 0.214. Salt is far more transparent to radiant heat than glass is and physicists therefore employ prisms and lenses of clear rock salt in experiments upon the infra-red rays of the spectrum. (Consult on this point, Tyndall, 'Contributions to Molecular Physics in the Domain of Radiant Heat.') Salt, from its abundance, is greatly used in the arts as a source of chlorine and of sodium. See CHLORINE and SODIUM).

In chemistry, a general name for any compound which may be regarded as consisting of an acid with its hydrogen partially or wholly replaced by one or more metallic bases, or by basic radicals; or for a compound consisting of a basic substance whose hydrogen has been more or less completely replaced by acid radicals. Ordinary sodium chloride, NaCl , for example (which is the substance commonly known as "salt" about the household), may be regarded as hydrochloric acid, HCl , in which the hydrogen has been replaced by sodium. Acetamide, $(\text{C}_2\text{H}_5\text{O})\text{H}_2\text{N}$, is a "salt" in accordance with the second portion of the definition, since it may be regarded as consisting of ammonia; NH_3 , in which one atom of hydrogen has been replaced by the monovalent radical "acetyl," $\text{C}_2\text{H}_5\text{O}$, of acetic acid. Simple chemical salts are classified, for convenience, as "acid," "normal," and "basic." An "acid" salt is one whose acid radical still contains one or more atoms of replaceable hydrogen; while a "normal" salt is one which contains no replaceable hydrogen. When sulphuric acid (H_2SO_4), for example, reacts with salts of potash, the potassium may replace half of the hydrogen of the acid, or all of it. In the former case we have the compound KHSO_4 , which is known as "acid sulphate of potassium"; and in the latter case we have the compound K_2SO_4 , which no longer contains hydrogen, and which is therefore called the "normal" sulphate. The acid salt may be regarded as an intermediate stage between the original acid and the "normal" salt. A "basic" salt is one which contains one or more molecules of hydroxyl, or of a metallic oxid, which can be replaced by an acid radical with the formation of a normal salt. A basic salt may therefore be regarded as intermediate between the base and the normal salt. Comparatively weak bases such as lead and bismuth, form basic salts, but powerful bases like lime and soda do not. Lead, for example, forms a basic nitrate having the composition $\text{Pb}(\text{OH})\text{NO}_3$; and when this is treated with nitric acid (HNO_3), the hydroxyl is replaced by an " NO_3 " radical, as indicated by the equation.

A salt which contains two different basic or acid radicals is called a "double salt." Ordinary sodium-potassium tartrate, or "Rochelle salt," $\text{KNaH}_2\text{C}_4\text{O}_6 + 4\text{H}_2\text{O}$, is an example, and so also is strontium aceto-nitrate, $\text{SrNO}_3(\text{C}_2\text{H}_3\text{O}_2)$. The phenomena which occur when two normal simple salts combine to produce a double

salt are doubtless quite complicated in some instances. The double salt $\text{MgSO}_4 \cdot \text{K}_2\text{SO}_4$, which is formed by the combination of the normal sulphates of magnesium and potassium, appears, when in solution, to be a simple mixture of the two constituent normal sulphates; but, on the contrary, the double salt $\text{PtCl}_4 \cdot 2\text{NaCl}$, which is formed by the union of platinic chloride (see PLATINUM) and sodium chloride, acts as though it were the normal sodium salt of an acid having the composition H_2PtCl_6 .

Physiological Uses of Salt.—Salt as a universal commodity has been used in all ages and civilizations. In biblical times the Jews offered salt to Jehovah with the first fruits of the harvest and the fruits of the earth; Homer calls it divine and chronicles its use in the repasts of his heroes; Tacitus tells of furious wars between the Germanic tribes for the possession of salt springs near their territories. Mungo Park saw the inhabitants of the coast of Sierra Leone give all that they possessed, even their wives and children, to obtain a salt supply. Salt is, in fact, an object of so general consumption, so necessary to man, that it affords an assured medium of exchange. The need for salt is not confined to man. Many animals seek this substance with avidity. Nothing pleases the appetite of sheep more than salt. Cattle may suffer cruelly from a lack of salt, and that, on the other hand, they thrive when it is added to their ration. Reindeer and red and roe deer love to lick the surface of brackish puddles and saline efflorescences. In all climates, in all latitudes, wild ruminants and other hoofed animals resort to salt licks, a circumstance of which hunters take advantage, choosing their shooting covers either where salt naturally effloresces or where they themselves have scattered it.

Salt was first used as an aliment at the time of transition from the pastoral and nomadic stage to sedentary and agricultural life. The Indo-European languages have no common word to designate salt, nor have they any for the greater number of the objects that relate to agriculture. But, on the other hand, they have common roots for all words relating to pastoral occupations. This is an indication that the primitive peoples from which modern races sprang were separated before they abandoned a pastoral life. They did not learn the art of agriculture until later, and with it they learned the use of salt. There are populations, ethnic groups, and castes that have never adopted it. The Egyptian priests did not salt their food. Plutarch was astonished at this strange disdain. And in the same way there are animals of the farm that are very fond of it, the dog and cat that do not care for it at all.

There is a well-established relation between a vegetable diet and the need for salt, and reciprocally between an animal diet and the exclusion of this article from food. The two kinds of diet, however, are not distinguished from each other by the quantity of salt which they contribute to the organism. In fact, both kinds are very poor in salt. Although both contain equally small quantities of chloride of sodium, they are distinguished from each other by another mineral product which they possess in an unequal though considerable degree. This is potash. In marked contrast with common salt, this substance, always abundant, varies greatly in its

relative quantity in different kinds of food. There are foods that contain a great deal of it, and these are precisely those that are taken from the vegetable kingdom. Plants are generally distinguished by their richness in potassic salts. They accumulate enormous quantities of them, drawing them from the poorest soils. Inversely there are other aliments derived from animals that are generally relatively poor in these compounds. In fine, the capital difference that distinguishes in the eyes of the chemist the two modes of diet, is the abundance of potash in the vegetarian ration and its deficiency in the meat ration. The information given by chemical analysis may be succinctly stated as follows: The vegetable kingdom furnishes the economy with much potash and very little soda—about 25 to 150 times more potash than soda. On the other hand, the animal kingdom reduces the supply of potash without reducing in the same degree the supply of soda. It introduces into the economy no more than two to five times as much potash as soda. All this is perfectly true and interesting in itself, but what hidden relation is there between the proportion of potash that distinguishes the two diets and the inequality in the need for salt which they produce. M. Bunge believes that he has discovered this relation. His hypothesis is that potash is responsible for the like or dislike of salt in cookery. This he justifies by a series of closely connected inductions. The need for salt is the consequence of the loss of salt from the organism, as thirst is the consequence of the loss of water due to hemorrhage, transpiration or other causes. The need for salt implies a previous loss of salt. Secondly, the loss of salt should be a phenomenon of a chemical nature resulting from reactions of disintegration. Thirdly, this chemical phenomenon having, as is proved by experiment, a relation to the different kinds of diet, should be caused by their chemical characteristics—that is to say, by the difference in their proportions of potash. Contrary to M. Bunge, it is claimed by other chemists that an exclusive vegetable diet causes a need, a particular appetite, which can be satisfied by substances having the taste of cooking salt and containing either chloride of sodium or chloride of potassium. In brief, from a chemical point of view, it is a need for chlorides; from a physiological point, a need for salty flavor; that is to say, for a particular kind of gustative sensation.

Condiments and seasonings are found to have a justification that is to some degree of a physiological character. They insure the proper action of the stomach. Salt does more. At the same time that it puts in motion the secretion of the stomach it furnishes it with materials, at least with some of them. Hydrochloric acid, which is characteristic of the gastric juice and ensures its digestive efficacy, is derived from salt, from the chloride of sodium of the blood. The same origin should be ascribed to the chlorine compounds found in the juices of the stomach, fixed chlorides and organic chlorine. In other terms the material for the chlorine compounds of the gastric juice comes primitively from the salt of our food. Ordinary salt, the chloride of sodium, is one of the constituent elements of animal organisms, existing everywhere in them. The blood has a saline taste more or less marked; all the

secretions are salty; the tears themselves are more salty than bitter, whatever good people may say about them. Salt water, in fact, bathes all living particles and leaches continually from the organic structure, escaping from all its tissues, carrying with it the waste matters which should be rejected from the body. Common salt is more suitable than any other for this purpose. In a dose of nine grams per 1,000 it forms a solution innocuous to the anatomical elements, that can circulate around the most delicate of them without causing the least damage. This close association with salt has become habitual to them from immemorial usage; they have adapted themselves to it, and it would lead to some inconvenience if another mineral constituent should be too abruptly substituted for it. In certain animals that have been bled to exhaustion, life may be kept up for some time if the blood is replaced by a saline solution, named, because of its properties, the physiological solution. A turtle or a frog in whose veins this fluid circulates continues to live for a considerable time.

According to statistical data the daily consumption of salt in Europe is on the average 17 grams per capita. Of these about two grams are necessary to cover the loss by disassimilation. These two grams represent *nutritive* salts. The remaining 15 grams would then represent on the one hand 8 to 10 grams carried away by excretions and necessary for restoring the constitution of the circulating liquids and a surplus; but, considering the influence of salt upon the secretions, it would not be prudent to say that this surplus is a sacrifice made to the pleasures of appetite.

Besides taking an active part in certain of the vital phenomena, common salt fulfils better than any other substance the conditions of a medium that is indifferent and yet suitable for the physiological necessities of living matter. In animals as well as in plants, in the mobile corpuscles of the blood as well as in the fixed elements of the tissues, living protoplasm is always rich in potassic salts. The interior medium which bathes it abounds, however, in sodic salts, particularly the chloride of sodium, resembling in this respect sea water, which might, if properly diluted, circulate in the veins and replace for a time the plasma of the blood, as we have seen may be done with the physiological solution. Some naturalists, recalling the circumstances under which life appeared on the globe and the manner in which it was for a long time maintained in the saline waters of the Palæozoic seas, have thought they perceived in this fact the survival of an ancestral condition. From this point of view chloride of sodium would be an element handed down from remote times, belonging to a medium suitable to animal life, to the blood and to the organic humors; and salted food, by introducing it about the anatomical elements of the body, would recall the marine origin of animal life, would connect, as one may say, the physiology of the present with that of the past.

Origin of Salt Deposits.—Nearly all rocks contain sodium in small quantities, in combination with other rock elements. When sodium-bearing rocks decay, the sodium, on account of its ready solubility, is one of the first elements to be contributed to circulating waters. Com-

binning with chlorine, it forms common salt. Much common salt exists in sedimentary rocks, and is contributed directly to circulating waters. By rivers it is carried down to lakes or to the ocean.

When rivers flow into lakes that have outlets, whatever salt is carried to the lake is carried out again by the out-flowing stream. But in lakes with no outlet and in the ocean, where there is little loss of water except by evaporation, salt is constantly being added and none removed. Since practically all rivers carry extremely small amounts of salt, in the course of time the ocean and most undrained lakes come to be very saline. When sufficiently salty to be perceptible to the taste, such lakes are spoken of as salt lakes. These lakes usually contain other salts in addition to common salt.

The salinity of various well-known bodies of water is tabulated below:

	Per Cent Common Salt	Per Cent Total Salts
Mississippi River at Memphis.....	.002	.02
Atlantic Ocean.....	2.790	3.63
Great Salt Lake.....	12.000	14.99
Dead Sea.....	8.030	22.30

When the degree of concentration becomes so great in these bodies of water that they can hold no more, salt will be deposited; just as brine, by boiling, leaves a crust of salt on the bottom of a dish. It is only in basins where evaporation is excessive that waters become concentrated enough for salt to be deposited. Such conditions are usually found only in arid regions, in undrained lakes and in arms of oceans or seas where evaporation is greater than river or spring supply, so that salt water from the open ocean or sea flows in to replace the excessive loss.

Many places are known where the less soluble salts are now being so deposited. In certain bays of Great Salt Lake and in many smaller lakes of the Great Basin, salts are now being laid down. Before the Salton Sea in southern California was flooded by the Colorado River, as high as 29 inches of salt was deposited daily during the dry season, most of which was common salt. Karaboghaz Bay, an eastern arm of the Caspian Sea, evaporates so rapidly that salt water from the main lake is constantly flowing in to make up for the loss. The concentration is so great that no life exists in the water and the less soluble salts are being precipitated, though as yet it is not saline enough for common salt to be deposited.

At seasons of flood, when rivers carry much sediment, the salt layers on the bottoms of the lakes or bays may be buried beneath layers of mud or sand. More salt may then accumulate as before and again mud and sand be washed in, until the salt is buried to a depth of hundreds, or even thousands of feet. The sands and muds solidify into rocks and later uplift of the land and erosion by rivers may expose the salt, as layers in the rocks, or they may be found by deep drilling. Such salt layers are common and are worked extensively in New York, Michigan, Kansas and other States, and in many foreign countries. Often many beds lie one above another, separated by layers of rock. In New York and in Kansas beds of solid salt over 300 feet thick have been discovered, and one at Spereberg, Germany, is known to be over 3,000 feet in thickness.

It may also happen, as in the peculiar "Domes" of Louisiana, that water which seeps through salt beds at great depth may find its way toward the surface along cracks in the rocks and fill these with salt which it deposits on its upward way. Sometimes the force of the growing salt crystals may arch up the overlying rocks into "Domes."

From deep beds, salt is secured in two ways. In New York, shafts have been sunk into the salt beds and it is mined like coal. But this underground method is employed more commonly in Europe. At Wieliczka, in Austria, about 1608 A.D., was opened up what is even yet the largest salt mine in the world. It is 984 feet deep and extends 300 feet below sea-level. In the mine are over 25 miles of railroad, converging at a central station carved entirely out of solid salt. In an enormous ball room the walls and ceilings of which glitter with salt crystals many royal fetes have been held. Over 1,200 miners are employed in the mine. Such underground mines, however, are rare. In the majority of cases wells are drilled through the overlying rock, and water is forced down into the beds and dissolves the salt, which is then pumped up in the form of brine and is evaporated either by the heat of the sun or over fires.

It also happens, as at Onondaga Lake, New York, and in many other places, that underground waters seeping through the salt beds come out at the surface as natural brine springs, whose waters are evaporated as in the previous case.

At a few localities about Great Salt Lake and San Francisco Bay, the salt waters are allowed to flow into shallow artificial basins, in which they can be completely shut off from the main body of water. These are allowed to stand until the sun's heat has evaporated the water, leaving a layer of salt. This process is much more widely employed in Europe than in the United States. (See MINERAL PRODUCTION OF THE UNITED STATES). Consult Dake, C. L., *Journal of Geography* (Vol. XI, 1913, p. 285).

SALT DEPOSITS, Formation and Geology. See SILURIAN SYSTEM.

SALT-GLAZING. See GLAZING.

SALT INDUSTRY, The.—Salt occurs in nature in two forms: as rock salt in beds; and as natural brine. In the United States the larger part of the production is from the rock salt deposits. New York leads the other States in output of rock salt, producing more than twice as much annually as Kansas, its nearest competitor; with Louisiana in third place and Michigan fourth. In the manufacture of brine salt Michigan led in 1917 with an output of 891,195 tons; New York ranking second with 517,273 tons; Kansas third, with 299,877 tons; and California fourth, with 192,565 tons. Rock salt produced and marketed as such in the United States in 1917 amounted to 1,605,025 tons, valued at \$3,897,595—an average value of \$2.43 per ton. The actual prices varied over the country from \$1.66 per ton in Kansas to \$10 per ton in Idaho. Of other grades of salt marketed in 1917 the totals were: 1,048,572 tons of common fine packers' salt; 688,022 tons of table and dairy salt; 493,515 tons of coarse packers' salt; 159,361 tons of solar salt; 93,094 tons of pressed block salt; and 2,890,588 tons

in the form of brine. The prices throughout the country for grained salt varied from \$2.41 per ton in New Mexico, and \$2.52 per ton in New York, to \$15 per ton in Hawaii, and \$15.60 per ton in Idaho. The consumption of salt in the United States in 1917 was nearly 140 pounds per capita. The exports in 1917 amounted to 113,993 tons, valued at \$1,000,773—nearly all going to Canada and Cuba; and the remainder distributed widely all over the world. The history of the manufacture of salt in this country is somewhat obscure in its early dates, but covers the entire period subsequent to the settlement of the colonies by the English. The early processes of making salt, which was first produced in this country in Virginia prior to 1620, consisted of exposing sea-water to the rays of the sun or by boiling it in pans or kettles till the salt had settled to the bottom. Later these same processes were used in extracting salt from the natural salt springs, but at the present time sea-water is little used for this purpose. Instead wells are sunk into the salt deposit, fresh water pumped in or allowed to flow in from a natural channel, and when thoroughly saturated the brine is pumped out and the salt extracted by evaporation. There are several methods of evaporating the brine; kettles, open pans, vacuum pans or grainers in which the brine is heated either directly by a fire below or by steam-pipe coils. Where kettles or open pans are used, the brine is usually boiled by direct heat, whereas in the grainers and vacuum pans steam heat is used. In the grainer process the brine is evaporated from rectangular vats about 12 inches deep by means of coils of pipes suspended in them and carrying either live or exhaust steam; when the water has been evaporated, the salt is removed from the bottom of the pan by mechanical scrapers. Solar salt is made in vats or ponds, covered or uncovered, and rock salt is mined and is now produced in much greater quantities than solar salt. The solar process is in use in California, Utah, and in Syracuse, N. Y.; the open pan process in New York, Michigan and Kansas; the vacuum pan in Michigan and the grainers in New York, Michigan, Ohio and Kansas. (See SALT; SILURIAN SYSTEM). The statistics of the industry as given in the 1914 census are as follows:

	1904	1914
Number of establishments . . .	146	98
Capital	\$25,586,282	\$33,151,134
Clerks, officials, etc.	418	724
Salaries	\$487,425	\$968,409
Wage-earners	4,666	5,089
Wages	\$2,066,399	\$3,041,294
Cost of materials used	4,166,137	4,455,457
Value of product	9,437,662	10,271,358

The table following shows the quantity of salt produced by States for the year 1917.

The number of plants in operation increased from 98 in 1914 to 128 in 1916; in 1917, 125 plants were active. The output of 4,872,656 short tons in 1914 was increased to 6,978,177 tons in 1917, and the value of the 1917 output was \$19,940,442; an increase of 9.7 per cent in quantity and 46.1 per cent in value over the figures for 1916.

STATES	Number of plants	Production, short tons	Value
Michigan	24	2,250,939	\$6,877,202
New York	23	2,164,069	5,371,713
Ohio	9	1,026,803	2,839,575
Kansas	10	746,976	2,027,466
California	26	215,154	933,429
Texas		85,181	564,029
Utah		79,195	352,145
West Virginia		24,844	191,044
Idaho		16	216
All Others		385,000	783,623

The group "all others" in the table above includes Hawaii, Louisiana, Nevada, New Mexico, Oklahoma, Pennsylvania, Porto Rico and Virginia. The individual figures are reserved to avoid revealing private business details to competitors.

For purposes of comparison the salt industry will be described according to States.

California.—The Spaniards, Mexicans and Indians first gathered salt in this State from the "tide lands" along the shores of Alameda Bay, the natural sinks or ponds there retaining the water which was evaporated by the sun, thus leaving the salt. No attempt was made to improve the quality of the salt till 1864, at which time the Crystal Salt Works were built. These works consisted of ponds for receiving and settling the sea-water so as to precipitate the gypsum and other impurities less soluble than the salt. After the salt itself was precipitated, the mother liquor, or bittern, was drained off leaving a salt of high quality, which was gathered up and conveyed to the warehouses. Thousands of tons of salt are taken to refining works in San Francisco, where it is subjected to artificial heat for the purpose of more thoroughly drying it, and ground into various forms used in chlorination works, packing-houses and silver mills, and for table and dairy uses. The principal salt works in California are located at Alvarado, Newark, Mount Eden, Russell and Baumberg on the eastern shore of San Francisco Bay, under the management of the Federal Salt Company, but there are other works located at Redwood City and San Mateo, in San Mateo County; at Salton, in Riverside County; National City, in San Diego County; near Danby, and at Ostend Station, near Los Angeles, in San Bernardino County; from the saline springs near Sites, in Colusa County; and at Black Lake, in San Luis Obispo County. The dense brine of Owens Lake yields a high percentage of salt and its waters are estimated to contain 160,000,000 tons beside much potassium chloride. The Searles Lake basin covers nearly 12 square miles—a crust from 60 to 100 feet thick, mostly salt. Rock salt outcrops for four or five miles on the north side of the Avawatz Mountains in San Bernardino County and is beginning to be worked. It is of excellent quality, 98 per cent pure. In 1917 the total production in California was 1,536,199 barrels valued at \$933,429.

Idaho.—In recent years salt has been made chiefly in Bannock and Bear Lake Counties, in the vicinity of Stump Creek and Tygee Valley in southeastern Idaho. The product is derived from salt springs, but it is known that

these are underlaid by beds of rock salt. The industry is centred at Auburn, Wyo. The 1917 output was very small, hardly reaching 20 barrels, used for feeding cattle.

Illinois.—There is only one establishment in Illinois, located at Saint John, Perry County, which in 1917 produced but a small quantity of salt.

Kansas.—The first salt produced in Kansas came from the marshes scattered over the central part of the State, along the banks of which crude factories were engaged in the business till 1868, but these were in time superseded by others of a more modern character. In 1867 wells were sunk at Solomon City and a plant erected for the purpose of drying the brine which had been struck at about 75 feet. In 1874 William Dewar established a plant in the same city, using the solar system of drying. The manufacture of salt was not very extensive prior to 1880, when 2,000 barrels were made; by 1890 this amount had increased to 1,140,799 barrels, and in 1900 to 1,645,350 barrels. The greater portion of the salt made in 1900 was evaporated by the grainer and open pan methods, though a small amount was made by solar evaporation. Brines are found in many localities in the eastern part of the State and are worked locally to some extent. In the development of the coal and petroleum industries in 1887, rock salt was struck near Hutchinson. In the same year a body of salt was also struck at Lyons, in Rice County, by a party of prospectors in search of oil or natural gas. In 1890 a company was formed and a shaft sunk, the drill penetrating the body of salt at 800 feet and passing through the bed to a further depth of 265 feet, making the total depth of the mine 1,065 feet. On sinking this shaft through the bed of salt, 15 workable veins, ranging from 4 to 18 feet in thickness, and alternating with layers of shale from three-quarters of an inch to five feet in thickness, were penetrated. In mining this salt, mining or channeling machines operated by compressed air are first used to undercut the salt; holes are made by air drills, dynamite inserted and exploded by electricity, thus bringing the salt to the bottom of the mine. It is then removed from the mine to the mill above ground, crushed and separated into nine different grades by passing over screens. It is then stored in bins ready for shipment or to be loaded on railway cars. At Anthony the salt beds show a combined thickness of 404 feet in a total depth of 1,350 feet; at Lyons the thickness is 275 feet in a depth of 790 feet; and at Kanopolis 250 feet in a maximum depth of 900 feet. The beds at Lyons and Kanopolis furnish the brines now worked at Ellsworth, Hutchinson, Sterling and elsewhere. Rock salt is known to underlay all of Rice and Kingman counties, nearly all of Reno County, and parts of Saline, Ellsworth, Barton, McPherson and other counties in the south central part of the State. The quantity of salt produced in 1917 in Kansas was 5,333,408 barrels valued at \$2,027,466.

Louisiana.—Until 1898 nearly all the salt produced in Louisiana came from Avery Island, where the first attempt to make salt in the State was made in 1791 by John Hays. The first shaft sunk on Avery Island was eight by eight feet and 83 feet deep. This was after-

ward leased to the American Salt Company, which continued it to a depth of 190 feet. In 1897 a new shaft, 500 feet deep, was sunk near the old one, and the new works were equipped with the most modern appliances. In 1898 a shaft was sunk on Belle Isle by the Gulf Company, of Morgan City, but water by dropping through the roof forced the abandonment of this, and a new one was sunk near it, an evaporating plant erected, and a considerable quantity of salt produced by the grainer process. The most important deposits in the State are on the Five Islands, or Salt Islands, as they are variously called, comprising Petite Anse, Grande Côte, Belle Isle, Côte Blanche, and Côte Carline. On the two first named rock salt is mined on an extensive scale. There are also large areas of rock salt in the north central and northern parts of the State. Owing to the very few operators, the figures of the yearly output are not reported in the interest of privacy of individual affairs.

Michigan.—An appropriation of \$3,000 was made on 4 March 1838 by the State for experimentation by the State geologist, and other work was done in 1840, 1841 and 1842, but no well was sunk till 1859 when a private corporation established a plant at Saginaw. During the year 1860, 472 barrels were produced and was gradually augmented, but irregularities in manufacture soon compelled the establishment of a State salt inspection bureau, and the salt manufactured was regularly inspected by the State official. The productive districts are three: (1) the southeastern part of the State, along the Detroit and Saint Clair rivers; (2) the central (nearly) part of the Lower Peninsula, especially in the Saginaw Valley; (3) along the west coast of the Lower Peninsula. Rock salt is worked at Ludington and Manistee and there is an undeveloped area on Thunder Bay near Alpena where five beds make up a total depth of 300 feet, with intervening streaks of gypsum and anhydrite. The output of commercial salt in Michigan is larger than that of any other State in the Union, and is approached only by that of New York. In 1917 it amounted to 16,071,704 barrels, valued at \$6,877,202.

Nevada.—The most important deposits are along Virgin River in the southeast part of the State. There are also numerous saline valleys throughout the Great Basin. In 1909 there were only three establishments in the State, the product being made from brine springs by solar evaporation. In that year the production was valued at \$19,847. The production in 1915 was 6,926 barrels, valued at \$3,950. Since that year the production has been concealed by grouping it with that of other States.

New York.—The manufacture in New York by white men was begun in 1788 in the Onondaga district. In 1797 the State assumed control of this reservation, maintaining it until 1898 when the title was sold because of the great expense of keeping up the works. During the first 44 years only boiled salt was made in the district, but in 1841 solar salt was also made. In 1883 the Warsaw district was opened up and about the same time the Genesee district began producing. In 1885 rock salt mining was begun near York, Livingston County; in 1892 shafts were sunk at Livonia and Greigsville in the same county. In 1888 the Solvay

SALT LAKE CITY

Temple Square, Salt Lake City, Utah, on the Denver and Rio Grande Railroad. Mormon Temple at the left, Tabernacle in centre, Assembly Hall at the right, Pioneer Monument in foreground

THE MORMON TEMPLE, SALT LAKE CITY

Process Company of Syracuse found salt in the south end of the valley of the Onondaga Creek in the town of Tully. Within three years 29 other wells were put down to the salt bed. They were all connected with the Tully Lakes, the water flowing by gravity into the salt shafts and forming a brine which is pumped out and carried to the works. The area in New York underlain with rock salt comprises a corner of Genesee County; the east half of Wyoming County; nearly all of Livingston County; and that part of Ontario County west of Canandaigua Lake. It has recently been developed also in Erie County, at Eden Valley, Springville, Perry and Gowanda, whence the bed reaches as far south as Pittsburgh, Pa. In 1917 the production amounted to 15,451,453 barrels valued at \$5,371,713.

Ohio.—Saltmaking was first attempted in 1798 at the Old Scioto Salt Works on the Salt Creek, in Jackson County. These continued till 1808 when the management was taken over by the State under the direction of the State superintendent, but as they became unprofitable as a State institution, they were later sold. It was not till 1825 that the other properties in Ohio were developed. The bulk of the present day production comes from two districts: (1) in the northeast section of the State, comprising Cuyahoga, Medina, Summit, Wayne and Lake Counties; and (2) in Meigs County, in the same basin in which the chief West Virginia salt area lies, just across the Ohio River. In the latter locality there are 148 feet in aggregate thickness, in layers varying from 3 to 52 feet thick, alternating with limestone and white shale to a depth of 3,710 feet. The industry centres at Pomeroy, where enormous quantities of brine have been raised, draining strata from many miles to the north, owing to the dip toward Pomeroy. The principal grades of salt made are table, dairy and common fine, solar and rock salt. The total production in 1917 was 7,331,373 barrels valued at \$2,839,575.

Oklahoma.—The first works were established in 1896, near Okeene, on a branch of the Cimarron River, and this was soon followed by three others. There are also works near Ferguson in the western part of the State and near Salton and Vincent in the southwestern part. The industry is for local consumption only.

Pennsylvania.—The salt industry was established in the Conemaugh River Valley early in the 19th century. About 1810 William Johnson commenced boring on this river near the mouth of the Loyalhanna, and was soon followed by many others. In 1812 salt was discovered near the present site of Saltsburg, in Indiana County, and by 1820 there were 32 pans and 190 kettles in operation in this county; Armstrong County had 38 pans in operation; Erie County 18 kettles of 32 gallons each; and Westmoreland County six establishments producing 70,000 bushels. In 1909 there was only one establishment in the entire State. The total output is comparatively small and consumed locally. It is now included in "Other States"

Texas.—The first well was sunk at Colorado City in western Texas in 1884, followed by another in 1889, and by a third in 1899. The principal production at present comes from Palestine (Anderson County) and Grand Saline (Van Zandt County) in the eastern part of the

State. Considerable quantities are made also from the salt lagoons along the southwest coast. The total production in 1917 was 608,192 barrels valued at \$564,029; the greater portion of the production being made in grainers or open pans.

Utah.—The first salt was harvested in 1848 from the shores of the Great Salt Lake. In 1900 the production amounted to 246,935 barrels, nearly all of which was made by the solar evaporation process. There is also a considerable production at Garfield, and natural brines are worked at Nephi. Rock salt is mined in the Sevier Valley, near Salina, Redmond and Gunnison. About 1860 the chlorination process for the reduction of silver from its ores was discovered, and salt for this purpose, produced at the Great Salt Lake, was first used at the Alice Mine in Butte, Montana. The total production in 1917 amounted to 565,452 barrels valued at \$352,145.

Virginia.—The only factory in this State is located in Saltville, in the valley of the Shenandoah River. The production is relatively small and is used in the production of soda-ash, bicarbonate of soda, etc., by electrolytic process.

West Virginia.—The principal points at which salt has been manufactured in this State are: Charleston, on the Kanawha River; Hartford, Mason City, Clifton and other places in Mason County, along the Ohio River; and near Birch on the Elk River; but the seat of the industry at the present time is in Mason County, opposite the Pomeroy workings of Ohio, only one of the four establishments in operation being outside. The first salt furnace in Kanawha County was erected in 1797, by a Mr. Brooks. On 1 Nov. 1807, David and Joseph Ruffner began boring for salt on the land which is now the present site of Charleston, on 15 Jan. 1808 struck a large stream of brine, and on 8 February secured their first output. By 1817 there were 30 furnaces and 15 or 20 wells in operation, which number had increased in 1835 to 40 furnaces. In 1849 Williams and Stevens erected the first salt furnace on the Ohio River at West Columbia; in 1854 another was erected by Hartford, Conn., parties; a third was erected at Mason City; and within a few years 10 more were erected, but the development of the industry in other States so overwhelmed the trade in this State that in 1909 there were only four in operation. Since then the industry has improved, reaching 238,397 barrels in 1916. The total output in 1917 was 177,386 barrels, valued at \$191,044. Consult United States Bureau of Mines Bulletin 146, 'Technology of Salt Making' (Washington 1917); United States Geological Survey Bulletin 669, 'The Salt Resources of the United States' (Washington 1919); Martin, G., 'The Salt and Alkali Industry' (New York 1916).

SALT LAKE CITY, Utah, capital of the State, county-seat of Salt Lake County, and the central seat of the "Mormon" Church, is finely located on a gentle slope at the western base of the great Wasatch range of mountains. The magnificent mountains behind the city, the lovely valley in front, the stately Oquirrh Range beyond the valley and Great Salt Lake, 20 miles to the northwest, add immensely to the attractions of the city. The elevation of the site above sea-level is 4,800 feet. The

main portion of the city is laid out in blocks of 10 acres each; the streets run at right angles and are 132 feet wide. Being in the arid belt, all vegetation depends upon irrigation, but nevertheless it is a city of gardens, shade-trees and flowers. The city is a central station for the Rio Grande Western Railroad, the southern terminus of the Oregon Short Line Railroad of the Union Pacific system, the eastern terminus for the Los Angeles and Salt Lake Railroad and the Western Pacific from San Francisco.

The trade of the city is very great, extending over Utah, western Wyoming, southern Idaho and eastern Nevada. The great mining districts of Park City, Big Cottonwood, Tintic, Bingham, are none of them more than three or four hours' ride from the city; the great smelters are in the valley only eight miles away, and Salt Lake is the general depot and clearing-house for their business. The miners from all over Utah and far into Nevada and Idaho send their ores to Salt Lake smelters for reduction, and purchase their supplies in the city. The bullion purchased in the city aggregates \$25,000,000 annually. There are 20 banks in the clearing-house, five savings banks and several loan associations. The total clearings for all the banks in 1915 amounted to \$350,000,000. The Salt Lake Mining and Stock Exchange, one year, sold 10,169,741 shares that aggregated \$6,165,323.15. The Lehi Sugar Factory, the chief ownership and business of which is in Salt Lake, one year made from 70,000 tons of beets, 23,000,000 pounds of sugar. The Salt Works on the lake shore, and owned in the city, manufacture annually 60,000,000 pounds of salt, valued at \$300,000. The Zion Co-operative Mercantile Institution sells goods to the amount of about \$6,000,000 annually. The product of its shoe factory amounts to over \$1,000,000. The manufacturing establishments include car shops, boot and shoe factories, machine shops, foundries, cement and lime works, harness works, lumber yards, cigar and tobacco factories, and confectionery plants. The total products exceed \$30,000,000 annually and employment is furnished about 10,000 persons.

The city has many fine structures. The joint city and county building is a most attractive building and cost, with furnishings, \$800,000. The Mormon Church has recently constructed their Administration Building costing about \$1,000,000. It is 165 feet in length by 102 feet in width, and four stories in height. For architectural effect it is one of the most beautiful office buildings in the United States. It is built of white Utah granite and the interior is finished in marble and onyx. The city has many imposing business blocks; some of the homes are palatial; the public schoolhouses are among the noblest in the country. Both the Episcopal and Catholic denominations have great hospitals, and the Latter Day Saints have a commodious hospital. There are private hospitals, as well as beautiful homes, for the poor and needy. The Saint Ann's orphanage, just south of the city, is a home and school for orphans and indigent children. The first known surgical operation for the removal of gall stones was performed in Holy Cross Hospital, Salt Lake City. The Latter Day Saints' College occupies several imposing structures, one of which

is a Memorial Hall built in honor of Brigham Young. The Utah State University has a commanding site on the bench east of the city. The Military Post of Fort Douglas is three miles east of the centre of the city at an altitude 600 feet above Main street. There are two theatres in Salt Lake, one built by the people several years ago, prior to the coming of the railroad. A Home Dramatic Company was formed; instructors were sent for; there was plenty of native talent; the theatre was a success; the Home Dramatic Company still flourishes. One result has been that Salt Lake has more first-class musical talent than any other city of its size in America. The tabernacle choir of 500 voices has a national reputation. The organist in the tabernacle, the leader of the orchestra in the theatre, are both native Utahans. At the great jubilee celebration in 1897 there were 18 native martial bands in the procession.

Since 1847 Salt Lake City has been the headquarters of the Church of Jesus Christ of Latter Day Saints (see MORMONS), the home of the president and many of the high officers of the Church; the place where the semi-annual general conferences of the Church meet in April and October. The temple, the tabernacle and assembly hall (for winter services and for meetings of the priesthood and consultation), with the temple annex, occupy a square. The tabernacle is a unique structure, 150 feet by 250 feet in size, roofed like a beehive, the roof arches being without support over the structure, with comfortable seating capacity for 8,000 people, though not infrequently 10,000 people gather there. It has one of the finest pipe organs in America. It is the chief place of worship for the Mormon people, though each of the wards of the city has a meeting-house where services and Sunday schools are held every Sabbath morning, and evening meetings during the week. The temple is one of the most splendid structures in America. Its walls are of gray Wasatch granite, in solid blocks nine feet thick at the bottom, six feet thick at the top, with a foundation 16 feet thick and 16 feet deep. The building is 186½ feet long by 99 feet wide, and is 107½ feet high from foundation to cap stone, while towers and pinnacles extend 50 feet higher. The ground was consecrated and work begun in 1853; it was finished and dedicated in 1893. It is used for marriages, baptisms and all the rites and ceremonials of the Mormon Church. Since its dedication only the faithful are permitted to enter it. It cost, with furnishings, about \$4,000,000.

About half of the people are Latter Day Saints. They have over 40 places for public worship. In 1876 the Roman Catholics established a mission in Salt Lake, a little later built a church and hospital. They now have charge of the great Holy Cross Hospital, the Saint Ann Orphanage, Saint Mary's Academy. Their cathedral is one of the finest and largest in the West—fully completed. A Protestant Episcopal Church was founded in Salt Lake in 1867, and two years later a hospital. It now conducts the hospital, has a church and a cathedral and carries on Rowland Hall, a modern high-class seminary for girls and young women. The Methodists came in 1869. They have five churches in the city, and a number of lesser

SALT LAKE CITY

View of Main Street

Shiplers, Photo.

structures. A Presbyterian Church and school were founded in 1875. Westminster College has been added to its schools, and a new and very fine church is now completed. The Congregationalists have a great school and beautiful church. The Unitarians, the Central Christian Church, the Baptists and Christian Scientists have places of worship. The Jews have a fine Synagogue.

The public schools of Salt Lake are interesting features of the city. The law requires the attendance of all minors (six to 18 years) for a fixed number of months annually. Books to pupils are free. The schools are governed by a board of education of 10 members. The board and superintendent are elected by the people biennially. There are 49 school buildings. In 1919, 23,341 pupils were enrolled, 21,687 attended the primary and grammar schools, 2,654 the high schools. The curriculum covers all branches taught in the best schools of the country, including music, dancing, sewing and manual training. In the high schools military training is insisted upon during the first and second years; and students are fitted for any of the universities of the country. In the graded schools 721 teachers are employed; in the high schools 160. Teachers' wages are from \$50 per month to \$125. The rule is to increase the salaries of the younger teachers from \$20 to \$40 per annum until the maximum wage is reached. In the schools one or more teachers came from practically every State in the Union. One public school building was completed at a cost of \$633,000. The annual expense for schools is over \$1,271,000. The value of the school property is \$4,000,000, or about 4 per cent of the total valuation of property in the city. Cost of maintaining schools, per annum, \$860,965; cost of books, \$60,000; cost, based on enrolment, \$105 per capita; cost per capita for books, 44 cents. There is a good public library with four branches.

Salt Lake City has the commission form of government since 1911. There are five commissioners, and the chief of police, fire chief, board of public works, water superintendent, board of health, city physician and building inspector are all appointed by the mayor and confirmed by the commission. The city has warm springs within its limits, and the hot springs, four miles out, have wonderful medicinal virtues. In the bathing season trains run every few hours to Great Salt Lake, 25 minutes' ride. The city owns its own water system. A private monopoly owns the light, the electric power plant and street car franchises of the city. The car company operates 135 miles of electric road.

The first settlement on the site was made by the immigrants who came in the first immigration under the leadership of Brigham Young, and reached the valley on 24 July 1847. The history of Salt Lake has no counterpart. The first band of immigrants were desperately poor. The soil they located on would produce nothing except through irrigation; they were 1,000 miles from any settlement east or west; they came as refugees; they were met by desolation; still at their coming they knelt upon parched soil and held a praise service. Their first crop was almost a failure, their second nearly all destroyed by locusts; that they lived through their trials must have been because they had

grown superior to distress. But they did live and multiplied. They had disciplined themselves to be content with life's barest necessities; they had few comforts, luxuries they did not dream of. They had been tossed naked upon the frontier; "a flaming sword that turned every way" was behind them. Since then there has been much clashing; once the government sent an army against them, but the city has grown and has become a great trade centre; it is the spot from which the Church of Jesus Christ of Latter Day Saints in every land receives direction; it is a beautiful city in itself; its surroundings are altogether august. No better climate can be found than in Salt Lake. In winter the thermometer seldom descends lower than 12 degrees above zero; it seldom reaches 100 degrees in summer; it has more clear days than any other city, and with the lake, the mountains, the springs and the invigorating air, it is a natural sanitarium. Pop. (1880) 20,768; (1890) 44,843; (1900) 53,531; (1910) 92,777; (1919 est.) 141,300.

Consult Bancroft, H. H., 'History of Utah' (San Francisco 1889), and Powell, L. P., 'Historic Towns of the Western States' (New York 1901).

J. DAVID LARSON,

Secretary Commercial Club of Salt Lake City.

SALT LICK, a place where salt is found on the surface of the earth, to which wild animals resort to lick it up; sometimes near salt springs.

SALT MARSHES. See SHORE LINES.

SALT RANGE, or **KALABAGH**, India, a mountain system in the Punjab, beginning on the south side of the Jhelum, and extending west to the Indus, reaching an elevation of from 3,200 to 5,000 feet. It consists of two chains running from east to west, which join in a high plateau; the general relief is bleak and dreary, while wildly picturesque. The mountains derive their name from the precipitous hills of solid rock-salt which occur on the border of the plateau. The salt stands out in huge cliffs at Mári, and the town of Kálabágh is built in an almost perpendicular hill of solid salt, in successive tiers,—the roof of each tier forming the street for the tier above. About 60,000 tons of salt are quarried annually, four-fifths from the Mayo mines, near Pind Dadan Khan. Coal and other minerals also are found.

SALT RIVER, (1) in Kentucky, has its rise in Boyle County, in the central part of the State; from whence it flows north, then west, then north by west to the northern boundary of the State, where it enters the Ohio at West-point, about 20 miles southwest of Louisville. It is about 100 miles long; and the chief tributaries are Rolling Fork, East Fork and Beech rivers. (2) A river in Missouri, which has its source in Schuyler County, in the northeastern part of the State, flows south by southeast to Monroe County, turns east, then northeast and southeast, and enters the Mississippi near the town of Louisiana, in Pike County. It is about 200 miles long, and is formed of three branches, North, Middle and South Forks.

SALTA, sāl'tā, or **SAN MIGUEL DE SALTA**, Argentina, (1) capital of a province of the same name, in the elevated and well-watered valley of Lerma (1,202 metres), about

800 miles northwest of Buenos Aires. It is a bishop's see, and has a cathedral. Other important features are: the main square or Plaza on which stand the Cabildo, or capitol; the *Colegio Nacional*; a branch of the National Bank; an orphan asylum, hospital and the above-mentioned cathedral. There is a brisk trade, especially transit trade with Bolivia. It is connected by rail with Buenos Aires and Jujuy. The town is neat but unhealthful. Pop. 38,000. (2) The province of Salta is situated in the northern part of Argentina, and covers an area of 48,302 square miles. Its frontier borders on Bolivian territory. At the west it is mountainous. The highest summits reach an elevation of 6,000 metres, the plateaus 1,300 to 4,000 metres, and some of the passes 3,600 metres. The Sierra Lumbre and the Sierra de Sanita Maria border on the Andes. The mountains contain rich mineral deposits of gold, silver, copper, nickel, iron and lead. The waterways are numerous: The Vermejo and its tributaries, Rio San Francisco and Rio Balle, and Rio Passage (del Juramento), which joins the Paraná as Rio Salado. The climate depends upon the altitude, and different crops are planted accordingly. The products are sugar, corn, wine and European fruits; barley, potatoes and fodder-crops. The lower slopes and valley contain the pampas; the high summits and plateaus are treeless. The inhabitants are for the most part a mixed race of Spaniards and Calchaqui Indians. Pop. 161,150.

SALTER, William Mackintire, American author: b. Burlington, Iowa, 30 Jan. 1843. He was graduated from Knox College (Ill.) in 1871; studied for the ministry at Yale and at Harvard and was graduated as B.D. at the latter in 1876; subsequently he studied philosophy, as Parker-Fellow of Harvard University, at Göttingen, and political science at Columbia University. From 1883 to 1908 he was lecturer for the Societies for Ethical Culture in Chicago and in Philadelphia; from 1909 to 1913, a special lecturer for the department of philosophy in the University of Chicago. He is the author of 'On a Foundation for Religion' (1879); 'Die Religion der Moral' (Leipzig 1885); 'Moralische Reden' (Leipzig 1889); 'Ethical Religion' (1889); 'First Steps in Philosophy' (1892); 'Anarchy or Government? An Inquiry in Fundamental Politics' (1895); 'Walt Whitman' (1900); 'Nietzsche: the Thinker' (1914), and of various articles in philosophical and literary periodicals.

SALTILLO, sāl-tēl'yō, Mexico, capital of the State of Coahuila; situated on the Tigre River, 65 miles southwest of Monterey, near the border line between that State and its neighbor on the north, the state of Nuevo Leon, elevation 5,249 feet above sea-level. It was given the rank of city in 1827 and named Leon-a Vicario, or Saltillo, by which latter name it is universally known. It was noted for many years for the superiority of the serapes made by the Indians of the vicinity,—a distinction, however, which has hardly been maintained in recent years. The battle field of Buena Vista, the scene of the defeat of the forces of Santa Ana, by General Taylor, in 1847, is but five miles distant, and near this are the baths of San Lorenzo. In the immediate vicinity are successfully grown all the fruits of the tem-

perate zone and many which pertain to the tropics. The principal buildings are the Civil hospital, the penitentiary and the Acuña Theatre, and the chief manufacturing establishments are cotton mills, flouring mills and soap and cotton seed oil manufactories. The city enjoys a favorable reputation as a health resort. The three principal educational institutions,—the Juan Antonio de la Fuente School, the College of San Juan Nepomenceno and the Normal School maintain creditable museums and there are four public libraries,—the State library and those connected with the three schools above named, which altogether contain over 6,000 volumes. The Bank of Coahuila, with a capital of \$1,600,000, and agencies of the National Bank, the Bank of London and Mexico and the Bank of Nuevo Leon provide the financial resources of the community. Pop. 35,414.

SALTO, Uruguay, the capital of the department of the same name on the northwest frontier opposite Concordia, Argentina, and at the head of navigation for large vessels on the Uruguay River. It is the shipping port of the surrounding region, a rich stock-raising district, and is 250 miles northwest of Montevideo, the capital of the republic, with which it is connected by rail. Pop. of town 19,788, of department 66,493.

SALTON SEA, a lake in the wide Colorado Desert or Imperial Valley in Imperial and Riverside counties in southeastern California. Under ordinary conditions it is a salt marsh covered in places by shallow lakes, about 30 miles long, 12 miles wide and 280 feet below sea-level. At times of freshets the lakes expand into a water body covering from 40,000 to 50,000 acres. In 1905 and 1906 the basin was flooded by accidental influx of water from irrigation ditches from Colorado River and it became a sea 42 miles long, 10 to 16 miles wide and 93 feet deep covering an area of about 470 square miles. The surface of the water at this stage was 198 feet below sea-level. In 1907 the influx of river water was finally stopped by dikes and since then the water area has been diminishing because of the great excess of evaporation over the very scant rainfall. The decrease in depth has averaged about 5.8 feet a year and at this rate the sea will return to its original condition in 1926 or 1927 when evaporation will equal the inflow of torrential waters from the slopes of the enclosed basin. Terraces slightly above sea-level on the sides of the basin indicate that there was formerly present a lake, called Lake Cahuilla By Blake, which was more than 120 miles long and 30 miles wide. Consult Mendenhall, W. C., 'Ground Waters of the Indio Region, California, with a sketch of Colorado Desert' (U. S. Geological Survey, Water Supply Paper 225, 1911); Newell, F. H., 'Salton Sea' (Smithsonian Institution, Annual Report for 1907); MacDougal, D. T., 'The Salton Sea' (Carnegie Institution, Pub. 193, 1914).

SALTONSTALL, sāl'ton-stāl, Gurdon, American colonial governor: b. Haverhill, Mass., 27 March 1666; d. New London, Conn., 20 Sept. 1724. He was graduated at Harvard in 1684, and became minister of the Congregational church of New London, Conn., in 1691. He succeeded Governor Winthrop as chief executive of Connecticut in 1708, and continued

in office until his death. The Saybrook Convention was suggested by him, and the historic "Platform" largely shaped by him. Through his efforts the first printing press was established in the colony. He was also active in the founding of Yale and in its establishment at New Haven.

SALTPETRE. See NITRATE OF SODA.

SALTPETRE, Chile. See NITRATE OF SODA.

SALTS, a very important class of substances in chemistry. The word salt was first used to designate the solid residue obtained by evaporation of sea water, and as sodium chloride is its chief constituent the term *salt* came to mean popularly that substance alone.

Many other substances besides common salt are known by the general name *salts* because of their similarity to common salt in general physical properties, such as solubility in water, taste, having crystalline form, etc. Some of the most common are saltpetre (potassium nitrate), smelling salts (ammonium chloride), etc.

The chemical meaning of the term salt is quite another thing. While the substances mentioned above are indeed salts in the chemical sense, many other substances, as oil of wintergreen, for example, that have none of the physical characteristics of common salt must also be included under this term. To the chemist, a salt is a chemical compound that may be considered as derived from an acid by the replacement of part or the whole of the hydrogen of the acid by a metal or a "radical" playing the part of a metal. For example, the salt sodium nitrate, NaNO_3 , is derived from the nitric acid HNO_3 , by the replacement of the hydrogen by the metallic element sodium, Na; also ammonium chloride NH_4Cl is derived from the hydrochloric acid HCl by similar replacement of hydrogen by the radical NH_4 . The most general chemical conception of the composition of salts is that which formulates them as MxNy , where M is the basic or positive portion and N the acid or negative part of the salt. Both M and N may be either elementary atoms or groups of different atoms acting as single atoms (radicals).

Taking common salt (NaCl) as an example, the positive radical Na may be replaced by another metal, or by a complex group of elements which is positive as compared with the other component of the resulting salt. Likewise, the negative radical Cl may be replaced by some other non-metal, or by a group of elements which is negative as compared with the other component. When solutions of two salts are mixed it is quite common that the positive radicals make a more or less complete exchange of their negative partners. This exchange is called in chemical parlance, "reaction."

Salts are formed in many ways; one of the most important being by the action of an acid on a base by which water and a salt are formed, the salt differing in properties from both the acid and base used. Thus hydrochloric acid and potassium hydroxide mutually react, the products being potassium chloride and water. $\text{HCl} + \text{KOH} = \text{KCl} + \text{H}_2\text{O}$. Salts are frequently formed by the action of an acid on a metal. Zinc and sulphuric acid forming the salt zinc sulphate and hydrogen $\text{Zn} + \text{H}_2\text{SO}_4 = \text{ZnSO}_4 + \text{H}_2$. A very common method for the

formation of salts is by the process called double decomposition, whereby two new salts are formed when solutions of two salts are brought together. When a solution of barium chloride is added to a solution of sodium sulphate a white solid separates which is a new salt barium sulphate, while in the solution is another new salt, sodium chloride. $\text{BaCl}_2 + \text{Na}_2\text{SO}_4 = \text{BaSO}_4 + 2\text{NaCl}$.

Salts are often classified as normal, acid, basic and double. An acid having more than one hydrogen atom replaceable by basic atoms or groups may form both acid and normal salts according to whether a part or whole of that hydrogen is replaced. An acid salt is therefore to be regarded as potentially an acid. Sulphuric acid H_2SO_4 can form acid salt KHSO_4 and the normal salt K_2SO_4 . An acid having three replaceable hydrogen atoms can form three varieties of salts. Phosphoric acid H_3PO_4 , for example, can give two acid salts KH_2PO_4 , K_2HPO_4 and a normal salt K_3PO_4 . A basic salt is one derived from a base having more than one hydroxyl (OH) group and in which all of the hydroxyl groups have not been replaced by acid groups. Basic bismuth nitrate $\text{Bi}(\text{OH})_3\text{NO}_3$ is derived from bismuth hydroxide $\text{Bi}(\text{OH})_3$ by replacement of only one (OH) by the acid group NO_3 . An acid salt still contains acid hydrogen and will unite with more base to form a normal salt. A basic salt still contains basic hydroxyl (OH) and will unite with more acid to form a normal salt. A normal salt contains neither acid hydrogen nor basic hydroxyl. The term double salt has been applied to two different classes of compounds, the dividing line between which is, however, often very faint. Acids having more than one replaceable hydrogen atom may form normal salts in which two or more different basic atoms or groups are combined with the acid group, as magnesium ammonium phosphate, $\text{Mg}(\text{NH}_4)\text{PO}_4$ or potassium sodium tartrate $\text{KNa}(\text{C}_4\text{H}_4\text{O}_6)$. Another class of double salts is formed by the union of two or more molecules of certain normal salts $\text{K}_2\text{SO}_4:\text{Al}_2(\text{SO}_4)_3$, $\text{PbI}_2:2\text{KI}$, etc. Double salts occur most commonly through the combination of one normal salt with another normal salt. One of these components will be a salt of a strong base which forms acid salts but not basic salts; the other component will be a salt of a weaker base which forms basic salts but not acid salts. That component which is the salt of the strong base, being the more acidic, appears as the negative radical; and the component which is the salt of the weaker base, being more basic, appears as the positive radical. Thus in the formula MxNy , in the case of double salts both M and N are in fact salts, and the double salt a union of a positive radical with a radical somewhat less positive.

Method of Naming Salts.—Part of the name is derived from the basic element or group present; thus those containing sodium are called sodium nitrate, nitrate of sodium, or often nitrate of soda, chloride of soda, etc. The other portion is derived from the acid element or group present. Thus salts derived from nitric acid are called nitrates; from hydrochloric acid, chlorides; from sulphurous acid, sulphites; from perchloric acid, perchlorates. It will be noticed that all but the last syllable is the same as the name of the acid and also

that this last syllable differs according to the last syllable of the name of the acid. An acid whose name ends in *ic* forms a salt whose name ends in *ate* (see exceptions below). One ending in *ous* forms an *ite* salt. A salt in which the acid part is a single element has the termination *ide*, even though the acid name ends in *ic*. Thus sulphuric acid forms sodium sulphate; sulphurous acid, sodium sulphite; hypophosphorous acid, sodium hypophosphite; hydrochloric acid, sodium chloride. Sometimes a metal forms two salts with the same acid in which the number of acid groups united with one atom of the metal varies. Thus iron (ferum) unites with nitric acid forming two salts, $\text{Fe}(\text{NO}_3)_2$ and $\text{Fe}(\text{NO}_3)_3$. The first one containing the smaller number of acid groups is called ferrous nitrate while the other is ferric nitrate.

The naming of acid salts has called into use a few other terms. The acid sodium salt of sulphuric acid HNaSO_4 is called acid sodium sulphate or hydrogen-sodium-sulphate. With an acid like phosphoric H_3PO_4 , having three acid hydrogens we have H_2NaPO_4 , di-hydrogen-sodium-phosphate or primary sodium phosphate, HNa_2PO_4 , hydrogen-di-sodium-phosphate or secondary sodium phosphate. The normal salt Na_3PO_4 is also called tertiary sodium phosphate.

As has been said, the term salt, salts, sal, are often applied to various substances of household or medicinal use. A few of the most common are given below with list of their correct chemical names. Sal soda, sodium carbonate; Epsom salts, magnesium sulphate; Rochelle salts, sodium potassium tartrate; saltpetre, potassium nitrate; sal ammoniac, ammonium chloride; salts of tartar, potassium carbonate; Glauber salts, sodium sulphate. See REACTION; SOLUTION.

SALTUS, sâl'tūs, **Edgar Everston**, American novelist: b. New York, 8 June 1858. He was educated at the Sorbonne in Paris, Heidelberg and Munich, and was graduated from Columbia Law School in 1880. His first book was 'Balzac: a Study' (1884), which he followed by 'The Philosophy of Disenchantment' (1885) and 'The Anatomy of Negation' (1887), two works attempting a popular exposition of the theories of Schopenhauer and von Hartmann. Among his novels are 'Mr. Incoul's Misadventure' (1887); 'The Truth About Tristrem Varick' (1888); 'Eden' (1888); 'The Pace that Kills' (1888); 'A Transaction in Hearts' (1889); 'Enthralled' (1894); 'When Dreams Come True' (1895); 'The Yellow Fay' (1905); 'Historia Amoris' (1906); 'The Lords of the Ghostland' (1907); 'Daughters of the Rich' (1909); 'The Crimson Curtain' (1916); 'The Paliser Case' (1919).

SALTUS, Francis Saltus, poet, linguist and musician: b. New York City, 1849; d. Tarrytown, N. Y., 24 June 1889. He was an elder brother of Edgar Everston Saltus (q.v.). He was educated at Columbia College and spent many years abroad. He made himself master of 10 different languages and contributed to magazines and newspapers a large number of sketches and poems in English, French, German and Italian under his own name and his pen name, "Cupid Jones." He was an accomplished musician. He published four comic operas and a comic history of the United States. At his

death he left the completed manuscript of 'The Witch of Endor,' 50 long poems on biblical subjects, 'Flask and Flagon,' 'Poems of Places,' 'Pastels and Profiles,' 'Flower and Thorn,' 'Flesh and Spirit,' 'Moods of Madness,' an unnamed volume of French poetry and two volumes of humorous poetry. In prose he left 'A Life of Donizetti,' 'A Life of Rossini,' 'Kings of Song,' 'Great Baritones,' 'Romance of the Opera,' monographs on Bellini and Mercadante, a musical dictionary, and more than a thousand musical sketches. He also left comic histories of France, Greece, Germany, England and Rome, a comic 'Robinson Crusoe,' and a large number of comic sketches. After his death his poems were edited in four volumes by his father.

SALTVILLE, Engagement at. The extensive salt works at this place, in southwestern Virginia, furnished that State, the adjacent States of the South and the Confederate armies their supply of salt. Not until the third year of the war did the Union forces make any serious efforts to destroy these works. On 2 May 1864 General Crook started from Charlestown, on the Kanawha, to join General Sigel in the Shenandoah Valley, and one column of 2,600 cavalry, under General Averell, was directed upon Saltville to destroy the works, and was afterward to rejoin the main column under Crook. After a very difficult march through the mountains Averell reached Tazewell Court House, where he learned that Saltville was well defended by earthworks and artillery, and was held in strength by Gen. W. E. Jones, whereupon he abandoned the idea of an attack, and, after a severe engagement at Wytheville on the 10th, joined Crook at Union on the 15th.

Late in September 1864 Gen. S. G. Burbridge with a mounted force of about 5,000 men, advanced through eastern Kentucky to Prestonsburg and up the Louisa Fork of the Big Sandy on Saltville. He was met 23 miles from Saltville by a small brigade of Confederate cavalry, which delayed him two days, thus enabling General Breckinridge to gather about 3,500 men at Saltville, so that when Burbridge appeared before the place, 2 October, he found the salt works well defended, with Breckinridge in command. He made an immediate attack and was stubbornly resisted, but after a hard struggle he gained the right and centre of the Confederate works. The Confederate left resisted all his efforts, and at 5 p.m. Burbridge withdrew from the contest, and abandoning his dead and wounded, marched all night toward Prestonsburg, thence continuing his retreat. The Union loss was 54 killed, 190 wounded and 104 captured. The Confederate loss was much less. On 12 Dec. 1864 General Stoneman, with 5,700 men, started from Bean's Station, Tenn., on a raid into southwestern Virginia. He attacked Saltville and carried it on the 20th, burned the town and destroyed the salt works. (See STONEMAN'S RAID). Consult 'Official Records' (Vols. XXXVII, XXXIX, XLV); Pond, 'The Shenandoah Valley'; Van Horne, 'History of the Army of the Cumberland' (Vol. II); The Century Company's, 'Battles and Leaders of the Civil War' (Vol. IV).

SALTZMANN, zälts'män, **Karl**, German painter: b. Berlin, 23 Sept. 1847. He was a pupil of Goldschmied and of the marine painter

Hermann Eschke. He made a trip round the world in the train of Prince Henry of Prussia and later became professor in the Academy at Berlin. His principal works are 'Dawn by the Sea' (1874); 'Entrance into Harbor of Colberg'; 'Harbor of Valparaiso' (1882); and 'Saved' (1884).

SALUS, sā'lūs, in Roman mythology the goddess of health, prosperity and public welfare.

SALUTATION, any mode of greeting or of kindly or respectful or reverential address, by word or gesture when persons meet, whether equals with equals or inferiors with superiors. The lowest class of salutations, which merely aim at giving agreeable bodily sensations, are compared by Tylor ('Early History of Mankind,' ch. iii), to the tokens of kindness exchanged among the lower animals: such are patting, stroking, kissing, pressing noses, blowing, sniffing, etc. Among American Indians one mode of greeting consists in rubbing each other's arms, breast or abdomen and their own; to the same class belong the pattings and slappings of the Fuegians. The Andaman Islanders salute by blowing into another's hand with a cooing murmur; Charlevoix tells of an Indian tribe on the Mexican Gulf who blew into one another's ears, and a similar usage was found existing in Equatorial Africa by Du Chaillu. The kiss is by no means what it has been by some authors reputed to be, a universal and instinctive act of salutation: it is unknown over half the world, and there the prevailing usage is that of smelling or sniffing, called "rubbing noses." Darwin finds this custom existing among the New Zealanders and Linnaeus among the inhabitants of the Lapland Alps; but it is the custom of Polynesians, Malays, the populations of Indo-China and the Eskimos. In ancient Greece it was customary to kiss the hand, breast or knee of a superior; in ancient Rome the kiss was a token of civility and was a customary mode of salutation among kinsmen and close friends. In the early Christian Church the kiss was a sign of fellowship, and Saint Paul in four places of his epistles and Saint Peter in one make such mention of the "holy kiss," as proves it to have been customary in the assemblies of the faithful. In the Roman Catholic Church the "kiss of peace" is to this day exchanged among the clergy after the consecration of the elements in the solemn high mass; but it is not practised by the laity in the nave of the church. The kissing of the feet was from very early times a customary mode of doing homage; it still continues in a modified form in the papal court, where the person who comes into the presence of the Pontiff kisses the golden cross upon his sandal. The custom of kissing among men appears to have persisted in England till the middle of the 17th century; it still exists in the countries of continental Europe. Sovereigns on meeting kiss each other on both cheeks, and in the World War French generals bestowed kisses similarly when presenting the *croix de guerre* to soldiers of any grade who had signally distinguished themselves. In many European countries the servant kisses the hand of master or mistress; and there remains a trace of this custom in the Spanish language, in the formula used at the close of a letter, equivalent to "your obedient servant," *beso a Vmd. las manes*, "I kiss

your worship's hands." The embrace is almost universal: it is used by the rude Andaman Islanders, the Blackmen of Australia, the Fuegians, as it was used by the Patriarch Jacob or by Philætius and Eumæus when, on recognizing Ulysses (*Odyssey*, Dryden, xxi),

Around his neck their longing arms they cast,
His head, his shoulders, and his knees embraced;

or as it is still used among highly cultured people. The attitude of covering or crouching in presence of a superior is seen represented in all the sculptures of ancient Egypt and Assyria; and in barbarous countries it still persists, as in Dahomey or in Siam; little different is the self-abasement of a Siberian peasant in presence of a noble. Bowing in sign of reverence may range all the way from Jacob's bowing himself to the ground seven times to do honor to Esau, and the gesture little more than a nod practised in modern society. Claspings hands was among the ancient Romans, as among us, customary among acquaintances; it is a custom not very widely diffused, but in late years it has been introduced among rude peoples, such as Australians, Hottentots and Fuegians through their contact with European traders and missionaries. The familiar words of greeting differ but little among modern civilized peoples. Our "Good morning" and "How do you do?" have their equivalents in the other European languages. But in German countries wherever the population is chiefly Catholic a current form of salutation, especially among peasants, is *Gelobt sei Jesus Christus*, and the response, *in Ewigkeit. Amen* (Praised be Jesus Christ for evermore. Amen). In Ireland it is, or used to be, a custom among simple folk for one on entering a house to pronounce the benison, "God save all here," and the response would be, "God save you kindly, sir (or ma'am)." The biblical "Peace to thee and to thine house" is still in use among the Moslem: *Salam 'alaikum. Wa- 'alaikum as-salam* (Peace be on you. And on you be the peace). The salutation of the ancient Greeks both at meeting and parting was *Xaipe* (be joyful); the Romans used two words, both signifying "be in health" or "be well"; on meeting their word was *Salve*, at parting *Vale*. The English phrase Good-by is the remnant of the ancient pious formula, God be wi'ye, and answers to the French Adieu, Spanish A'Dios, Italian Addio, etc.

SALUTES, Military, an essential form of discipline regulated and enforced by military law. All officers salute on meeting and on making or receiving official reports. Military courtesy requires the junior to salute first or when the salute is introductory to a report made at a military ceremony or formation to the representative of a common superior, as for example to the adjutant or officer of the day, the officer making the report, whatever his rank may be, is required to salute first; the officer to whom the report is made will acknowledge by saluting that he has received and understood it. When under arms the salute is made with the sword or saber if drawn, otherwise with the right hand, and a mounted officer always dismounts before addressing a superior who is not mounted. On official occasions officers, when indoors and under arms do not uncover, but salute with the sword, if drawn, and otherwise with the hand. If not under arms they uncover

and stand at attention, but do not salute except when making or receiving a report.

When an enlisted man without arms passes an officer he salutes with the right hand, and officers are to be saluted whether in uniform or not. When armed with the saber and out of ranks an enlisted man salutes with the saber, if drawn, but otherwise with the hand. If on foot and armed with a rifle or carbine he salutes with his weapon. A mounted soldier dismounts before addressing an officer not mounted. An enlisted man, if seated, rises on the approach of an officer, faces him and salutes; if standing he faces the officer for the same purpose. If both remain in the same place or on the same ground such compliments need not be repeated, and soldiers, if at work, do not cease work to salute an officer unless addressed by him. Before addressing an officer an enlisted man salutes as prescribed, and he also makes the same salute after receiving a reply. Indoors and unarmed an enlisted man uncovers and stands at attention on the approach of an officer. He does not salute unless he addresses or is addressed by the officer. If armed he salutes as though outdoors.

When an officer enters a room where there are soldiers the word "attention" is given by someone who perceives him, when all rise and remain standing in the position of soldier till the officer leaves the room; but soldiers at meals do not rise. Officers are required to at all times acknowledge the courtesies of enlisted men by returning salutes given, and when several officers in company are saluted, all who are entitled to the salute return it.

SALUTES WITH CANNON. The salute to the Union—one gun for each State—is fired at noon of the Fourth of July at every military post and on board commissioned naval vessels belonging to the United States. The National Salute of 21 guns is the salute for the National flag, the President of the United States, presidents of foreign republics or sovereigns of foreign states visiting the United State. The Vice-President of the United States and American and foreign ambassadors are saluted with 19 guns; the president of the Senate, Speaker of the House of Representatives, members of the Cabinet, the chief justice, a congressional committee, governors within their respective States or Territories, viceroy or governor-general of provinces belonging to foreign States, general of the army, admiral of the navy and same ranks in foreign armies and navies, 17 guns; American or foreign envoys, or ministers plenipotentiary, assistant secretaries of the navy or war, lieutenant-general or a major-general commanding the army, and corresponding ranks in the navy and foreign armies and navies, 15 guns; ministers-resident accredited to the United States, major-general, rear-admiral and corresponding ranks of foreign armies and navies, 13 guns, and chargé d'affaires, brigadier-general, commodore and corresponding ranks in foreign armies and navies, 11 guns. Consuls-general accredited to the United States receive a salute of nine guns.

Salutes are only fired between sunrise and sunset, and not on Sundays, except in international courtesies. The national colors are always displayed at the time of saluting. The

salute to the flag is the only salute which is returned, and this must be done within 24 hours. United States vessels do not return the salute to the flag in United States waters if there is any fort or battery there to do it. Nor do United States vessels salute United States forts or posts.

If there are several batteries or forts within sight or six miles of each other, one of them is designated as the saluting fort, and returns all salutes of foreign men-of-war. In New York, Castle William, on Governor's Island, is the saluting fort.

SALVADOR (in official documents, **EL SALVADOR**), the smallest and most densely populated of the Central American republics, is bounded on the north and northeast by Honduras, on the southeast by the Gulf of Fonseca, on the south by the Pacific Ocean and on the west by Guatemala. Its area is usually given as 7,225 to 7,325 square miles. The capital, San Salvador, is situated in the valley of Las Hamacas, on the Acelhuate River, 2,115 feet above sea-level. Frequent disasters have taught the inhabitants the art of building earthquake-proof structures, with utilitarian rather than æsthetic motives; nevertheless the desire to secure good architectural effects reasserts itself (notably in the design of the National Palace); there are pleasant parks, and efforts are being made to complete the paving and the drainage system.

Physiography.—On the northern frontier rises the great mountain chain, the Sierra Madre or Cordillera, with peaks 7,000 to 8,000 feet high, in which primitive rocks predominate. About 15 miles from the coast and running parallel with it is a range composed of plutonic material. Both systems include transverse ridges; the latter, the Coast Range, is intersected by the valleys of the Lempa and Grande rivers, and in or near it are situated the volcanoes San Vicente (7,683 feet), San Salvador, Santa Ana, San Miguel, Usulután, Apaneca, Izalco, Sociedad and Chinameca (4,200 feet). Izalco is almost continuously active. Earthquakes are of frequent occurrence: the capital has been wrecked by them 12 times since 1539, and is, in fact, "so subject to rockings and tremblings of the earth as to have acquired the name of the swinging hammock." The best natural harbor is that of La Unión, but it is not yet connected with the capital by rail. Acajutla, El Triunfo, La Concordia and La Libertad are the other ports. The largest lakes are Güijar (15 miles long by five wide) and Ilopango (nine miles by three); the chief rivers are the Lempa, the Paz and the San Miguel.

Political Divisions and Cities.—The republic of Salvador is divided into 14 departments, subdivided into districts, and these into towns and municipalities. The political subdivisions of the republic, with their capitals and populations, are shown in table on following page.

Fauna and Flora.—Among the native animals are the deer (*Cervus mexicanus*), armadillo, the jaguar and its little brother called ocelote on the coast, the pecari (*Sus americanus*), puma or American lion (*Felis concolor*), tapir, coyote (*Canis aureus mexicanus*), etc. We mention, among the avifauna, the

DEPARTMENTS	Capitals	Populations of capitals (approximate)
San Salvador.....	San Salvador.....	75,000
La Libertad.....	Nueva San Salvador...	15,000
Sonsonate.....	Sonsonate.....	15,000
Ahuachapán.....	Ahuachapán.....	15,000
Santa Ana.....	Santa Ana.....	40,000
Chalatenango.....	Chalatenango.....	10,000
Cuscatlán.....	Cojutepeque.....	10,000
Cabañas.....	Sensuntepeque.....	12,000
San Vicente.....	San Vicente.....	12,000
La Paz.....	Zacatecoluca.....	7,500
Usulután.....	Usulután.....	7,500
San Miguel.....	San Miguel.....	25,000
Morazán.....	Gotera.....	5,000
La Unión.....	La Unión.....	5,000

quetzal (*Trogon splendens*) and among reptiles the lagarto or caiman (*Crocodilus americanus*), the iguana and the boa constrictor. Dr. Guzmán calls attention to the "surprising vitality of the vegetable kingdom" and gives an interesting list of medicinal and dye plants, together with those he classed as textile, oleaginous and alimentary. The balsam, which the Indians call Hoitziloxitl and which is commonly known as "balsam of Peru" although it is produced only in this part of Central America; the indigo and maguey (*Agave americana*) may well head such list.

Mineral Resources, Soil and Climate.—In a report devoted to mining operations, the consul-general of the United States writes from San Salvador: "For this republic a report can only be made on the production of gold and silver. While a number of promising copper fields are known, almost nothing has been done as yet in their development." In 1916 the authoritative statement was made that the output of gold and silver "amounts to about \$1,500,000 annually." The soils on the slopes of mountains, table-lands and in the valleys, formed by the detritus of the rocks and decomposed vegetable matter, are remarkably fertile. The year is divided into two seasons—the rainy months being those from May to October, the dry from November to April. Low coast lands are hot and unhealthy; a comparatively cool and agreeable climate is found in the highlands of the interior.

History.—In the summer of 1524 Pedro de Alvarado invaded the territory now called Salvador, coming from Mexico by way of Guatemala. The Indian capital, Cuscatlán, was captured the following year. On 4 April 1528 the city of San Salvador was founded, but it became necessary to abandon the site originally chosen in favor of the present one, and the transfer was made in 1539. As a subordinate part of the viceroyalty of Guatemala, Salvador continued to be a Spanish possession until 1821. Between 15 Sept. 1821, when Guatemala severed her connection with Spain, and 1824, when the Central American confederation was formed, Salvador was compelled to assent to the annexation of her territory by Mexico. After the federation had dissolved (1839) Morazán tried to reunite the five small states of which it had been composed; in September 1842 he was made prisoner and shot at San José, Costa Rica. In 1885 the President of Guate-

mala, Gen. Justo Rufino Barrios, made an effort to restore the old relations between the states in the northwestern part of Central America. He also failed. On 13 Aug. 1886 Salvador promulgated the constitution which is now in force, displacing (it is expressly stated in the final clause) the constitution of 1883. The most important single fact in the history of the little republic, as in that of Guatemala (q.v.), is the survival of the Indian element in undiminished force. Educated Salvadorians of the present day, when writing of the sufferings of the natives during the period of Spanish supremacy, unconsciously refer to the wrongs *sustained*, not *inflicted*, by their own ancestors. (It is desirable to add, in view of the diversity of usage, that the forms "Salvadorian" and "Ecuadorian" seem to be preferable to "Salvadoran" and "Ecuadoran.") In February 1913 President Araujo was assassinated. On the conclusion, in 1915, of the term for which Dr. Araujo had been elected, the distinguished Carlos Meléndez took office for the term 1915-19. For Salvador's interest in the canal treaty between the United States and Nicaragua (Treaty Series, No. 624, Washington 1916) see NICARAGUA and NICARAGUA CANAL. The most important subjects inviting the attention of the Meléndez administration were educational and financial.

Government.—By the constitution "legislative power is vested in a body called the National Assembly of Deputies," which meets in February, each year. Deputies, three from each department, are elected by the people. "Executive power is vested in a citizen who shall have the title of President of the Republic"; his term is four years; he cannot be re-elected until after the expiration of a second period of equal duration. The vice-president is also chosen for four years. Secretaries or ministers are appointed by the President, the portfolios being: Foreign Affairs, Public Instruction and Justice; Interior, Promotion and Charities; Finance, Public Credit and Agriculture; War and Marine. "Judicial power is vested in a Supreme Court of Justice, in Chambers of third and second instance," etc. Each of the 14 departments has its governor and deputy governor (Constitution of the Republic of El Salvador, 13 Aug. 1886, IX, Art 3), whom the Executive appoints. Municipalities are governed by officers chosen by the people.

Diplomatic and Consular Service.—The United States has at the capital, San Salvador, a minister, a consul-general, a vice- and deputy-consul; Great Britain sends a minister and consul-general, a consul and (at San Salvador and La Unión) a vice-consul. El Salvador maintains a minister in Washington and has a consul-general at San Francisco and consuls in New York and New Orleans. In Great Britain El Salvador has a chargé d'affaires and consul-general, with consular agents at London, Liverpool, Glasgow, Southampton, Newport, Brighton and Birmingham.

Population, Education and Religion.—The census of 1 March 1901 showed, as the total number of inhabitants, 1,006,848, of whom 772,200 were mestizos, ladinos and whites and 234,648 Indians of pure blood. In 1917 population was given as about 1,700,000. Under the constitution (Art. 33), "teaching is free. Primary

instruction is compulsory. The instruction given in the establishments supported by the state shall be laical and gratuitous.* Besides the ordinary six-year elementary schools, rural schools have been established which give a brief course of instruction covering three years and provide not only for the children of the white people but also for native Indians. About 31,000 students and pupils are enrolled at the institutions of learning of various grades: the university, the normal and high schools and the 700 primary schools. On 6 April 1919 a school for rural teachers was opened in the city of Santa Ana, in which will be given lectures on methods of carrying out the official program of public instruction. Article 12 of the constitution provides: "The free exercise of all religions is guaranteed, the only limit being that which considerations of morality and the public order prescribe."

Agriculture.—Nearly all of the high valleys and table-lands of the republic are well adapted to agriculture, which is, therefore, the principal occupation of the inhabitants. Products are coffee, indigo, rubber, cacao, balsam, tobacco and a variety of grains, seeds and fruits. In regard to coffee, the following statistics were prepared by the government: Area planted in coffee trees, 153,517 acres with 95,000,000 trees; virgin lands suitable for growing this crop, about 50,000 acres; average bearing life of a coffee tree in Salvador, 30 years and average production, 350 grams. The shipments of coffee from the republic to foreign countries in 1915 and 1916 amounted to 80 per cent in the value of the total exports; in 1914 their aggregate was 34,666 tons—other exports being sugar (1,008 tons), indigo (134 tons), hides (178 tons), leaf tobacco (33 tons), balsam (71 tons) and gold and silver (\$1,481,772). Most of the 1917 coffee crop was damaged by the earthquake and volcanic eruption of 7 June 1917. Other agricultural products are cheese, beans, upland rice, corn and sugar. The government is encouraging cotton-growing by bounties on exports. Efforts are also being made toward wheat cultivation and tree planting is encouraged. There are in Salvador 281,013 head of cattle, 74,336 horses, 21,457 sheep and 422,980 pigs.

Commerce.—In 1917 the imports subject to duties aggregated \$2,719,095 and the exports amounted in the same year to \$10,588,900. The trade is chiefly with the United States, the United Kingdom and France. The principal im-

ports in 1916 were cotton, hardware, flour, silk goods and yarn. The chief exports in the same year were coffee, 35,585,498 kilos (Kilo = 2.04 pounds), valued at \$23,297,003 silver dollars; indigo, balsam, \$298,498; tobacco \$30,566; and sugar \$646,528. Of the total coffee exported, 20 per cent went to the United States; 20 per cent to Norway; 2 per cent to Holland, 29 per cent to France; and 4 per cent to Great Britain.

Banking and Finance.—The government's estimate of public revenues in the budget for 1915-16 was 10,800,000 pesos. Memorandum number two, by the delegation of El Salvador (Proceedings of the First Pan American Financial Conference, Washington 1915, pp. 629-634) gives the import revenues of 1913 as 7,263,042.98 silver dollars or pesos and of 1914 as only 6,076,770.61, showing a loss of 1,186,272.37 pesos in the first year of the war. The delegates add: "Before the world crisis, the monetary situation of Salvador was good (because the banks had been obliged, under governmental decree, to bring up their silver reserves at the time of the failure of the so-called Banco Nacional, which had no connection whatever with the government). As a matter of fact, the capital of the three banks now doing business is 6,000,000 pesos. They may issue double their capital in notes, on condition of having on hand 40 per cent (Banco Occidental and Agrícola Comercial) or 50 per cent (Banco Salvadoreño). In our national budget there is always an item called 'public credit,' which has varied in the last few years from 3,000,000 to 4,000,000 silver dollars or pesos, for the amortization of the English loan and of the domestic loan and for the payment of the respective interests involved."

The message of the President of Salvador to the National Assembly in the *Diario Oficial* of 20 Feb. 1917 contained a statement of the revenues and expenditures of the country during the year 1916, which showed a more favorable condition of affairs than at any time since 1913. The revenues of Salvador during those four years, in silver pesos (peso = .3078, fluctuating), were as follows: 1913, 13,734,133 pesos; 1914, 12,423,752 pesos; 1915, 10,625,174 pesos; 1916, 12,779,082 pesos, showing that in the last year the downward tendency was checked and an increase of 2,153,908 pesos over the previous year was reached.

The revenues and expenditures in the year 1917 are shown, as follows:

REVENUES	Pesos	EXPENDITURES	Pesos
Import duties.....	5,856,185	National assembly.....	120,403
Export duties.....	1,963,317	Executive.....	84,309
Tax on liquors.....	2,653,966	Government.....	2,603,929
Stamps and sealed paper.....	501,680	Protection (formulas).....	1,292,715
Miscellaneous revenues.....	816,404	Agriculture.....	63,105
Direct (income) taxes.....	269,365	Justice.....	205,933
Interest.....	716,165	Public institutions.....	1,174,386
		Philanthropy.....	630,760
		Treasury.....	833,956
		Public credit.....	1,597,579
		War and marine.....	3,637,038
Total.....	12,779,082	Total.....	12,468,082

The President called attention to the revenue of 137,794 pesos derived from the income tax established last year, to be increased by 74,670 pesos in late collections. Payments on the national debt during 1916 amounted to 2,168,572 pesos silver. The President pointed out the need of an established monetary system to prevent fluctuations in the foreign exchange and recommended measures for new coinage. The monetary system is based on a silver standard; the peso, divided into 100 centavos, containing 25 grammes of silver .900 fine. The par value of the peso in currency of the United States is normally 0.3978, and the value of \$1.00 is 2.51345 pesos.

Railways, Roads, Shipping, Etc.—A narrow-gauge railway line connects the port of Acajutla with the capital, San Salvador, 65 miles; a branch line extends 25 miles to Santa Ana; and other branch lines connect Santa Tecla with the capital and Santa Ana with Ateos. According to the Pan American Union's *Latin America*, page 42, "the system of the International Railways of Central America which is intended to connect the Salvadorian port of La Unión with ports in Guatemala is under construction." The total length of railway open is 210 miles, all of narrow-gauge. Great improvements have been made during the last 10 or 12 years in the methods of constructing highways and other roads which facilitate travel in the interior. There are 1,467 miles of good road in the republic. Over 400 steamers enter the ports of the republic annually; regular steamship connection is maintained with Salina Cruz on the north, Corinto on the south and intermediate ports; through steamers between San Francisco and Panama call at the ports of Acajutla, La Libertad and La Unión when traffic warrants; and, in order to stimulate maritime commerce, subventions have been given at different times to several important steamship companies. There are 117 post offices, 203 telegraph offices, with 2,521 miles of wire and 176 telephone stations, with 2,074 miles of wire.

MARRION WILCOX.

SALVAGE, the act of saving a ship or goods from extraordinary danger, as from fire, the sea, an enemy, pirates or the like. In commercial and maritime law: (1) A payment or compensation to which those persons are entitled who have by their voluntary efforts saved ships or goods from extraordinary danger, as from fire, the sea, an enemy, pirates, or the like. The amount of salvage to be paid is generally

agreed on between the salvors and the owners of the property salvaged; but if they cannot agree, the sum to be paid, and the proportions in which it shall be paid, are determined by the Admiralty Court. The crew of a ship are not entitled to any salvage for any extraordinary efforts they may make in saving their own vessel. (2) The property saved from extraordinary danger by the voluntary efforts of the salvors. See ADMIRALTY LAW.

SALVARSAN AND NEOSALVARSAN.

The term salvarsan is used commercially as the equivalent of dioxydiamido arsenobenzol, the formula for which is $C_{12}H_{10}O_2N_2As_2$. It is popularly known as 606 because its originators Ehrlich and Hata made that number of experiments and combinations with arsenical preparations before arriving at salvarsan. Its discovery was announced in the early part of 1911. It is also known as the Ehrlich-Hata preparation. The active element in this combination as indicated in the formula is arsenic of the trivalent form, the quinquevalent form being much less potent as a spirochætocide. The aim and the hope of Ehrlich in his long series of patient efforts was to find a substance which in a single dose at a single blow should overpower syphilis (q.v.) a goal which he termed *therapia magna sterilisans*. A very ambitious project, almost an impossibility, and yet he barely missed it.

In the experimental work in which apes had been successfully syphilized with cultures of *Spirochæta pallida*, contrary to the belief that animals could be inoculated with syphilis, Ehrlich's dream had been partially realized. Apes, including chimpanzees, had been sterilized, that is, they had been cured of experimental syphilis with a single dose of salvarsan but in human beings this cannot be done. Still salvarsan is one of the greatest of human achievements in the field of therapeutics.

Remarkable results, not cures, have been obtained and may still be obtained with a single dose of salvarsan, especially if the disease is treated in the very early stage, but to produce such a profound effect as is implied in the *cure* of syphilis would require a larger dose than could be tolerated by a human being, it would produce a poisonous and probably a fatal result.

Salvarsan is prepared as follows: Sodium amalgam (28.8 grams of 4 per cent sodium) is added to 30 cubic centimeters of water and 32 cubic centimeters of 2N-acetic acid containing 4.98 grams of 3-amino-4-hydroxyphenylarsenious oxide. A yellow precipitate is produced. When the amalgam has been used up there is added 25 cubic centimeters of 2N-acetic acid and 28.8 grams more of the sodium amalgam. This procedure is once more repeated, when the reduction will be complete. The precipitate is then dissolved in 60 cubic centimeters of methyl alcohol, and the calculated amount of methylalcoholic hydrochloric acid is added. The salvarsan hydrochloride is then precipitated by adding ether after filtering.

Commercial salvarsan is a pale yellow, bulky, micro-crystalline powder which is permanent when dry, but highly oxidizable in air, and decomposes in aqueous solution, and especially in those which are alkaline, even in the absence of air. It dissolves readily in water, methylalcohol, ethylene-glycol, and glycerol and sparingly in ether and acetone. It has an alkaline

reaction. As found on the market it is generally mixed with impurities, and is quite variable as to its content of arsenic. For therapeutical use it must be dissolved in distilled, *not in boiled water*, for it has been found, or at any rate supposed that the albumen from the organisms in the water which has been boiled for the solution would vitiate the action of salvarsan when introduced into the body. Unlike mercury it may not be taken by the mouth nor rubbed into the skin by means of an ointment. It is used entirely by injection, three methods being possible, the subcutaneous, the intramuscular and the intravenous. The subcutaneous method has been practically abandoned for the substance remains within the tissues as an infiltrate, without producing any appreciable effect upon the spirochetes which are the cause of the disease. In fact it becomes a distinct source of harm, and cases have repeatedly been reported in which it has resulted in abscess and extensive neurosis of tissue.

Intramuscular injections have been approved by some physicians and discarded by others. The large muscles of the gluteal region are usually selected for this purpose and the injection into them is made deeply. The objections to this method are the intense and persistent pains which follow the injections and the continuance for a prolonged period of the infiltrations. These infiltrations do not terminate in suppuration but the salvarsan may become disintegrated and cause arsenical poisoning.

The form of injection which now receives the approval of the majority of experienced syphilographers is the intravenous.

The veins at the bend of the elbow are selected for the injection, the skin being first carefully sterilized. A tourniquet is secured around the arm and the injection is made into either of the veins which are thereby distended. After the operation of injection has been accomplished the wounded vein must be carefully dressed, this precaution being an important one.

It is also very important that the injection should not be made as a matter of office routine, but in the patient's house, or in a hospital where all necessary appliances are at hand. The patient should remain in bed from 24 to 48 hours after he has received the injection. The reaction which may be expected from an intravenous injection of salvarsan usually consists of slight elevation of temperature, chill, fever, headache and vomiting.

The quantity of salvarsan which should be used in an injection is from 0.4 to 0.6 gram. Death has been attributed to arsenical poisoning in some of the fatal cases, as large a quantity as three or more grains of arsenic having been liberated into the body by the disintegration of the injected salvarsan.

It is quite apparent that the danger which attends the intravenous method is much greater than that which attends the intramuscular. Contra-indications to the use of salvarsan are heart disease in various forms, including aneurysm and dilatation, myocarditis and uncompensated valvular disease. It should not be used in cases of advanced nephritis, nor in those cases of tertiary syphilis in which the cerebral and meningeal symptoms are threatening, in arterio-sclerosis nor in the presence of

high fever. Blindness and deafness have occurred after the injection of salvarsan but they have usually cleared up after a suitable course of treatment with mercury. It is now believed that syphilis cannot be cured with salvarsan alone but that it should be used in conjunction with mercury, except possibly in primary syphilis. "Sodium salvarsan," prepared by precipitating with alcohol a solution of salvarsan in aqueous sodium hydroxide in the presence of a stabilizer (such as sodium hydrosulphite, mannitol or other polyhydric alcohols), has proved satisfactory in the ambulatory treatment of syphilis. "Copper salvarsan," prepared by adding sodium hydroxide to a solution of salvarsan and a copper salt, has been found useful in the treatment of "sleeping sickness."

Neosalvarsan or Novarsenobenzol.—The untoward results which attended the use of salvarsan induced Ehrlich to continue his experiments in the hope of discovering a substance by which they might be obviated. In October 1911 he introduced Neosalvarsan or "Ehrlich 914" (the number indicating the total in the series of his experiments, from the beginning), a condensation product of formaldehyde, sulphonylate of sodium and salvarsan. Its distinct advantage over salvarsan is that it is neutral in reaction, salvarsan being alkaline.

It is a dry powder which is readily soluble in water or preferably in a dilute solution of sodium chloride.

It is used by injection either intramuscularly or intravenously, and will not cause infiltrations like salvarsan, nor will it cause necrosis of the veins into which it is injected, nor will it produce the severe pain which is caused by salvarsan. Because of its neutral reaction it will modify or abolish certain distressing symptoms which have frequently followed the use of salvarsan including vaso-motor disturbances and congestions which have sometimes resulted in collapse, œdema of the face, diarrhœa, colic, etc. Larger doses of this substance may be used than of salvarsan of which it contains 66 per cent. It is always safer, however, to begin the treatment with a small dose, especially in women, and increase them as the indications may warrant. Thus the limits of dosage may be placed between 0.3 and 1.5 gram. The contra-indications are the same as for salvarsan.

A pronounced advance in the treatment of syphilis and kindred disorders has been made possible by the development of two other neosalvarsans, known as "Galyl" and "Ludyl," respectively, "No. 1116" and "No. 1151" of Mouneyrat's series. The first is an acidic substance dissolving in aqueous sodium carbonate to a neutral solution, and as such, very suitable for intravenous injection in the treatment of syphilis and other protozoal diseases. Ludyl is prepared by the Schotten-Baumann reaction from benzene-*m*-disulphonic chloride of salvarsan. Both galyl and ludyl, as used in the treatment of syphilis, have a very energetic spirillicidal action, while being but feebly toxic and well tolerated in the system. There is no apparent congestive action of the organs of the body following their use, and no secondary ill effect on the nervous system; while their action upon the blood and general nutrition is favorable.

Under the use of these substances, especially

when combined with mercury, the symptoms of syphilis rapidly improve, and the Wassermann test, which should be repeated every month or two, will indicate the progressive destruction and disappearance of the spirochetes.

There is no definite time limit within which salvarsan or neosalvarsan, in connection with mercury, should be used; it may be a year; it may be much longer. A persistent negative Wassermann reaction indicates the disappearance of the cause of the disease, but just when this limit will be reached it will be impossible to predict in any given case. The use of salvarsan and the neosalvarsans has also been extended to the treatment of relapsing fever, scarlet fever, malaria and various nervous diseases including cholera.

ANDREW F. CURRIER, M.D.,

Associate Surgeon New York Woman's Hospital.

SALVATIERRA, sāl-vā-tē-ēr'rā, Mexico, city in the state of Guanajuato, on the Rio Lerma, and the Celayo-Acambaro railroads, 50 miles southwest of Queretaro. The chief industry is cotton-spinning. Pop. 14,322.

SALVATION ARMY, The. The story of The Salvation Army is the story of an aggressive religious organization that has won its way around the world entirely on its own merits and has built itself up from what had hitherto been regarded as most unpromising material. The Army is organized on military principles, with a view to reaching the non-churchgoing masses of the world. It was first started in July 1865, in the East End of London as the Christian Mission. Thirteen years later, at Christmas 1878, it received the name of The Salvation Army. Since then its growth throughout the world has been phenomenal. The late Gen. William Booth (q.v.), its well-known father and founder was born in Nottingham, England, on 10 April 1829; d. London, 20 Aug. 1912. In 1852 he entered the ministry of the Methodist Church and became a powerful evangelist, attracting immense crowds and witnessing thousands of conversions. Finding, however, that the churchless masses could not be reached by ordinary methods, he resigned his pastorate and established the Christian Mission which afterward developed into The Army. In this he was ably assisted by his wife, Catherine Booth, who was familiarly known as the Mother of The Salvation Army. She was born in 1829 and died on 4 Oct. 1890. She was regarded by many as the most eloquent and powerful woman speaker of the century and did more than any other to open up the way for women to preach the Gospel. The absolute equality of women as leaders, officeholders and preachers became one of the cardinal planks in The Army platform. As a temperance movement the value of the work of The Army cannot be over-estimated. It has been said that The Salvation Army has been the means of converting hundreds of thousands of confirmed drunkards. As total abstinence is a condition of membership, this can be readily understood.

The international headquarters of The Army are in London. Its world-wide operations are carried on in 61 countries and colonies, embracing 9,673 posts, under the charge of 23,200 officers and employees, with 61,685 local officers, 28,150 brass bandmen. Eighty periodicals are pub-

lished in 35 languages, with a weekly circulation of about 205,000. There are 1,173 social relief institutions and 615 day schools in the world, under the charge of nearly 3,100 officers and employees. About 7,399 fallen women annually pass through the 119 rescue homes and from 80 to 90 per cent of these are permanently restored to lives of virtue. About 2,701 ex-convicts pass annually through the prison gate homes. There are 147 slum settlements in the poorest districts of great cities, the worst dives, saloons and tenements being regularly visited. The number of annual conversions in connection with the spiritual work have averaged from 225,000 to 275,000 during the past 10 years, making a total of approximately 2,500,000, of whom not less than 250,000 were converted from lives of drunkenness.

The headquarters of The Salvation Army in America are in New York. Commander Evangeline Booth, daughter of the founder of The Army, is in charge of the work. A separate territory has been formed of the country west of the Mississippi, under Commissioner Thomas Estell, with headquarters in Chicago. The first party of officers, under Commissioner George Railton, landed in New York in March 1880.

The social relief work of The Salvation Army rose, without deliberate plan, to meet certain immediate needs. After 25 years of application The Salvation Army has trained a large body of men and women who are experts on all questions of social relief. Municipal governments in all parts of the country call its officers to council on the problems of poverty and unemployment and the criminal and its various homes in many cities are considered necessary parts of the corrective system. The Prison work of The Salvation Army has made long strides during the last 10 years and its prison department is assuming considerable worth to the parole boards of several States.

Training colleges for cadets have been established for the training of officers in New York and Chicago.

The principal literature of The Salvation Army includes the following books: 'Darkest England,' 'Religion for Everyday' and 'Training of Children,' by General William Booth; 'Servants of All' and 'Bible Battle Axes,' by Bramwell Booth and the 'Life of Catherine Booth,' the 'Life of Consul Emma Booth Tucker,' by F. Booth Tucker; 'Helps to Holiness' and 'When the Holy Ghost is Come,' by Col. S. L. Boeagle. Its weekly papers are the *War Cry*, with a circulation of 70,000, the *Strids Ropet* (Swedish War Cry), 9,000 fortnightly and the *Young Soldier*, 38,000, issued for children.

SALVATOR, one of the names of the monitor lizard; and also applied to a South American lizard, the teju (q.v.).

SALVE REGINA, sāl've rē-jī'na, the first words of a prayer addressed to the Mother of Christ, in Roman Catholic religious services. The words are also applied to the music used in connection with the prayer.

SALVIA, a large genus of the *Labiata*, occurring in temperate or warm regions, sev-

eral living in the southwestern United States. They range in size from herbs to shrubs, in foliage from entire to pinnatifid leaves and in inflorescence, from axillary to paniced. The flowers are sometimes two inches long and of nearly every hue except yellow; and the floral leaves are often changed into colored bracts, adding to their brilliance. The genus is remarkable for the arrangements made for cross-fertilization. The blossoms have a two-lipped corolla, two rudiments of stamens and two poliniferous stamens. The latter stand at the entrance to the throat of the flower, have short immovable filaments and a very long connective between the two anther cells of which the lower is abortive. This connective is crescent-shaped, the horns pointing outward and rocks upon the filament in such a manner that a bee entering the blossom pushes back the lower arm and brings down the other on its back, so that the pollen-filled anther cell deposits part of its contents there.

Salvia officinalis, the common sage (q.v.) and many others are cultivated either for savory herbs or for their flowers; or, as in the Clarys (*S. selarea*), for colored bracts; or, as in *S. argentea*, for its wholly white foliage.

SALVINI, sāl-vē'nē, Tommaso, Italian tragedian: b. Milan, 1 Jan. 1829; d. 1 Jan. 1916. He began his studies at Florence but showing a talent for acting, his father, who was an actor, put him under the instruction of Gustavo Modena and at 16 he entered upon his stage career. In 1849 he left the stage to take part in the war of Italian independence, was made a corporal and served throughout the siege of Rome. He returned to the stage the following year and acted in the company with Adelaide Ristori. He soon began the study of those parts that he later played with such success, orosmane in 'Zaire,' 'Oreste,' the 'Saul' of Alfieri and Shakespeare's 'Hamlet' and 'Othello.' His success in Italy was such as to warrant him in looking abroad for honors and he next appeared at Paris where the critics were equally enthusiastic in his praise. In 1865 he took part at Florence in the celebration of the 600th anniversary of the birth of Dante, reciting passages from the 'Divine Comedy.' He played in various cities of Spain and in 1871 went to South America to play at Montevideo, Buenos Aires and Rio de Janeiro. In 1873 he appeared for the first time in the United States, enacting Othello at the Academy of Music, New York, 16 September. In 1875 he appeared in London. He afterward played in many parts of Europe and again in America in 1880, his supporting company being American actors, speaking English while he spoke Italian. He has made five visits in all to the United States; in one of these (1886) playing Othello to Edwin Booth's Iago and the Ghost to the other's Hamlet. He retired from the stage in 1891. Besides parts already mentioned he has appeared with distinction in the Egisto of Alfieri's 'Merope'; Palo in 'Francesca da Rimini'; Oedipus in a play of that name written for him by Nicolini; Conrad in 'La Morte Civile'; in 'Sampson, the Gladiator,' 'Macbeth,' 'King Lear,' 'Coriolanus,' and finally in 1891 at Florence as Iago. Consult Winter, William, 'Shadows of the Stage' (New York 1892); id., 'The Wallet of Time' (ib., 1913); 'Leaves

from the Autobiography of Tommaso Salvini' (London and New York 1893).

SALVINIA, a genus of an aquatic family (*Salviniaceæ*) of cryptogams. They are floating plants, widely distributed in warm regions and not far removed from the ferns. *S. natans*, common in southern Europe and tropical America, has a sparingly branched stem lying on the water and develops three leaves at each node; two of these float as oval, green, and papillose foliage, hairy underneath, while the submerged third is divided into numerous hairy filaments, hanging like tassels in the water and metamorphosed into absorptive organs, that appear to be true roots, but are not. The spherical sporocarps, or sori, are borne near the junction of these filaments with the stem and are generally in groups of three, each enclosed in a cuplike growth from the filament, like the indusium of a fern and enclosing unisexual sporangia. The sporangia are composed of either microspores or macrospores. The microspores form antheridia and liberate spermatozoids which fertilize the archegonia developed by the macrospores. Several species of the *Salviniaceæ* are useful in aquaria.

SALWIN, sāl'wēn, **SALWEEN**, or **SALUEN**, Burma, the most important river of the country. It has its source in the Tanla Mountains, south of the Kuen Lun, drawing also from the Kara Nor, some of its water. At its source, it is known as Nagtschu, and consists of the united volume of water coming from the glaciers of the mountain streams rising on the Tibetan plateaus. Its name among the Chinese is Lu-Tse-Kiang. The Burmese call it Thanlwin. About 160 Kilometers from its mouth appear many dangerous rapids, a great menace to navigation. The current is variable. It is a wild and picturesque stream, whose aspect varies greatly in the dry and wet seasons. After the rains the water washes high up the slopes against the trees of the forests; the average difference between high and low water amounting to from 50 to 90 feet. In the lower part of its course, islands also obstruct navigation (not visible at high water). The worst part is the gorge between the Yonzalin and Kyankhnyat rivers. Many ferries are used to cross the river and at these points villages are built on the heights above. There are a few bridges in Chinese territory. The Salwin's chief tributaries are the Nam Yu, Nam Oi, Hsipa Haw, Nam Nim, Nam Ting, Nam Kyek, Nam Nang, Nam Koa, Nam Hka and Nam Pang—its largest tributary,—the Nam Hsim, Mē Sili and Mē Sala; the Nam Hang, Nam Pan, Nam Teng, Nam Pawn, the Thaung-yin and the Yonzalin. The Salwin cuts the British Shan states almost in two. Kyodam, the great timber depot, lies 30 miles below the junction of the Thaung-yin and the Salwin. A cable stretched across the river at this point catches all the timber (teak), which is made into rafts and floated down to Kado near Maulmein (where the revenue is collected). From Kyodan southward and as far as Shwegon, 63 miles from Maulmein, boats and steamers of light draft can safely navigate. The area of the Salwin Basin is 62,700 square miles. Its length 800 miles, breadth from one to four miles.

SALZBRUNN, zälts'broon, Germany, a group of three villages (New, Lower and Upper Salzbrunn), in Prussian Silesia, 30 miles southwest of Breslau. It is famous as a watering place and has eight mineral springs. The water is alkalo-saline. Many thousand bottles are exported annually and several thousand persons visit the springs in the season. The water is especially adapted to pulmonary complaints. There are various industrial works, including glass and porcelain factories, wool looms, coal mines and brickyards. Pop. 6,459.

SALZBURG, zälts'boorg, Austria, (1) capital of the duchy or province of that name, occupies a position of singular beauty on the Salzbach, 87 miles southeast of Munich. It lies in a valley from which tower the wooded slopes of the Salzburg Alps. The steep sides of the Mönchsberg rise from the midst of the town, rocky and rugged. In the ancient cemetery of Saint Peter, the vaults are hewn in rocky clefts. Many of the private and public buildings are handsome marble structures and are suggestive of the Italian. Shady promenades skirt the winding river. The cathedral is a fine specimen of Renaissance, built in 1614-28 in imitation of Saint Peter's. A monument to Mozart, who was born here, stands in Mozart-Platz. The present palace of the archbishops is an imposing edifice, opposite to which are the government offices and law courts. Across the river is the Mirabell palace, once the summer residence of the prince-archbishops. There are 24 churches, a theological seminary and schools, hospitals, fine libraries, a museum, riding schools, etc. Salzburg is a very popular summer resort, which contributes much to its development and progress. A park, theatre, art gallery and baths are among the most recent improvements. There are numerous benevolent and charitable institutions. Salzburg engages in a variety of small manufactures, such as musical instruments, marble ornaments, iron-ware, cement, artificial wool, etc. Its trade is improving. Its origin and development were equally ecclesiastical, its archbishops German princes. The monastery and bishopric founded here (500-700) by Saint Rupert of Worms, was the nucleus of the present town. It has been the scene of several religious conflicts and is distinctively Catholic. Pop. about 38,000. (2) The duchy covers an area of 2,762 square miles. It is characteristically mountainous with longitudinal valleys intersecting the hills. Of the 200 lakes, Lake Zell is celebrated for its wondrous mountain panorama. It has many mineral and thermal springs and valuable mines and forests. Pop. about 200,000.

SALZMANN, zälts'man, Christian Gotthilf, German Protestant clergyman and educator: b. Sommerda, Thuringia, 1 June 1744; d. Schnepfenthal, 31 Oct. 1811. He was educated at Jena, served as pastor in 1768-81 and was teacher of morals and religion at the Philanthropinum, Dessau, in 1781-84. He was a believer in the natural religion, and the school which he established at Schnepfenthal was organized on especially broad principles. Salzmann held the theory that isolation was a requisite of moral education, was a determined opponent of many methods of teaching then in force and held the faults of the pupil to be

justly credited to the master. His school attained a considerable reputation and was continued after his death. His writings on educational matters were extensive, most of them being in the form of fiction or of satire upon prevalent practice in instruction. Author of 'Krebsbüchlein' (1780); 'Karl von Karlsberg' (1780-86); 'Konrad Kiefer' (1794); 'Ameisenbüchlein' (1806), etc. His collected works were published (12 vols., Stuttgart 1845-46). Recent editions are those of Wagner in 'Klassiker der Pädagogik' (1900) and Ackerman in 'Bibliothek pädagogische Klassiker' (1897-1901). Consult the 'Memoir' published by the school at its centenary in 1884.

SÁMAL, sā'māl, an island of the Philippines in the northern part of Davao Bay forming the east shore of Pasiputan Strait, length 17 miles, width 13 miles, area 140 square miles. Its general elevation is 820 feet, some parts of the shores are low and wooded and other portions are high and rocky. The soil is fertile, and chocolate is the chief product; excellent timber is also obtained. The island is well populated, having seven small towns on its western coast.

SAMALES, sā-mā'lēz, (1) a small tribe of the Philippine Islands, living on the island of Samal in the Gulf of Davao, on the east coast of the island of Mindanao. They are of the Malay race. (2) The name sometimes given to the Moros inhabiting the islands between Basilan and Sulu, Philippines; they are also called Sámables-Laút.

SAMANA (sā-mā-nā') BAY, an indentation of the eastern coast of Santo Domingo, Haiti, 30 miles long and 10 miles wide. It affords an excellent harbor, being well sheltered and deep, capable of accommodating the largest vessels. The ports of Sanchez and Santa Barbara de Samana are on the north coast. The bay has an important position near the route from the United States to the Isthmus of Panama; in 1870 a treaty was negotiated providing for its purchase by the United States, which the United States Senate refused to ratify.

SAMAR, sā'mār, an island of the Philippines, the third in size of the archipelago. It lies southeast of Luzon, in the extreme northeastern part of the Visayan group and east of Leyte, from which it is separated by the narrow strait of San Juanico; length northwest and southeast 156 miles; width 75 miles; area 5,198 square miles, with dependent islands 5,488 square miles. A central mountain chain traverses the island from northwest to southeast, being divided near the centre by the valley of the Ulut River; there is also a group of mountains in the extreme northwest. Their height rarely exceeds 1,700 to 1,800 feet. The island has a number of rivers, of which the largest and most important are the Oras and Ulut on the east, the Bató on the north and the Gándara on the west, and there are four lakes. Among the natural curiosities is an arch over the Bases River formed by two limestone rocks from 34 to 40 feet high. In the rocks on the left a cave opens 37 feet above the water, which is 94 feet deep; it has been partially destroyed by the caving of the rocks overhead. The place is known

as the *Cuevas de Sojotón*. The soil is fertile and adapted to the production of all the staples of the Philippines; the most important products are hemp, sugar, rice and cocoanuts; the hemp product for export amounted to over 21,000,000 pounds in a single year. Coffee, chocolate, tobacco and wheat are also cultivated in abundance. A number of medicinal plants grow on the island, the most famous being the one producing the seed called "isigud," or the "fruit of San Ignacio," also known as "Catbalogan seed," because large quantities of it are grown near the town of Catbalogan. This is highly prized by the Chinese as an efficacious remedy for cholera. Valuable timber is found; bamboo and rattan are abundant, and wax and honey are obtained in large quantities. Coal, gold and copper are found in the mountains, but have not been mined. The raising of horses, cattle, hogs and goats is an important industry. Sugar and cocoanut-oil are manufactured and there are other manufactures for domestic use. Though there are few roads in the island there is good communication with the interior by means of the rivers which are navigable for native boats. There is also an extensive coast-wise trade and trade with Manila. The people of Samar are of Visayan blood, representing most fully the characteristics of the Malay race. They are, as a rule, industrious. Some native refugees, about 10,000, live in the mountains, practically independent and savage in their manner and customs. During the last insurrection there was an insurgent stronghold at Sojoton which was captured by United States troops in November 1901. The island of Samar with its adjacent islands was constituted a province and placed under civil government in 1902, in accordance with the provincial government act of the Philippine Commission. Pop. 266,237.

SAMARA, sā-mā'rā, Russia, (1) capital of a province of the same name, at the junction of the Samara River with the Volga, 550 miles southeast of Moscow. It is the seat of a governor and of a bishop, and one of the main ports of the Volga. Its principal buildings are its churches—mostly Russian—convents, schools and seminaries; theatres, banks, industrial establishments, philanthropical institutions, public libraries and museums. Its manufactures include machinery, leather, soap, etc. There is an enormous trade in corn, hides and meat, fish and caviare and salt, and a large transit trade between Samara, Khiva, Bokhara and Tashkend. Three markets are held annually. The Koumiss health resorts are celebrated. Pop. 145,600. (2) The province of Samara, in the southeast, has an area of 58,321 square miles. At the north it consists of flat low tablelands, interspersed by deep river valleys. The chief streams are the Volga, Tcheremshan, Sok and Samara. The Zheguleff Mountains rise opposite the town of Samara, from the banks of the Volga. The remainder of the province is covered by low, flat steppes, excepting two spurs of the Obshchiy at the southeast. Agriculture and gardening are the chief occupations of the inhabitants, also stock-raising and bee culture. There is considerable domestic and foreign commerce. The principal fairs are held at Novouzensk and Bugulma. More than an average number of schools are provided. The Serghievsk mineral springs are much fre-

quented. There is a large German colony. The chief towns are Samara, Bugulwa, Buguruslan, Buzuluk, Nicolayevsk, Novo-Uzeñ and Stavropol. In 1889 Samara suffered from famine and a great plague and the Russian Red Cross Society cared for 100,000 people. Pop. 3,710,100.

SAMARANG, sā'ma-rāng', Java, a seaport town on the north coast, 255 miles east of Batavia, the principal port for the trade of Middle Java, since 1873 connected at Surakarta with the Java Railway. The European quarters have all the appearance of a typical Dutch town. The more important buildings are a military hospital, the city hall (1854-64), Christian churches and schools. A fort and a coast battery provide defense for the town. The river is silted up at its mouth, but a canal, constructed in 1879, serves as a harbor. The roadstead is exposed during the west monsoon. Pop. (1905) 96,660, including 12,372 Chinese and 4,800 Europeans.

SAMARIA, sa-mā'rī-ā, Palestine, (1) the ancient capital of Samaria, 36 miles northwest of Jerusalem, occupied the acclivity of an isolated and abrupt height—Mount Sameron, which is separated from the surrounding mountains by a rich and well-watered plain. The town rose in terraces from this plain to a height of 400 or 500 feet. Samaria was the capital of Northern Israel from the date of its foundation by Omri, about 925 B.C., to the time of its capitulation to the Assyrians 721 B.C. The site was selected by Omri for a stronghold and capital, as commanding two of the most important high-roads. The situation surpasses greatly that of Jerusalem, though not so picturesque. It commands, however, a charming view toward the Mediterranean, the mountains of Schechem and Mount Hermon. The most important ruins are those of the time of Herod. It was in Samaria that the 10 tribes of Israel founded their independent state after the revolt, perpetuating their mutual animosity by incessant warfare. Thus the name Samaritan became a term of bitter reproach. This antipathy was religious as well as political, but was later mitigated by the return of the Samaritans to the ancient form of worship, and by the erection of a temple, modeled after that of Solomon in Jerusalem, soon after Alexander the Great had passed through Syria. Samaria having been presented by Augustus to Herod, he rebuilt the city which had been the residence of all the kings of Israel till its overthrow by the Assyrians—calling the new temple Sebaste, in honor of the donor. An old church or mosque, once dedicated to John the Baptist, in the adjacent village of Sebastieh, marks the scene of that saint's burial or martyrdom. In the great World War the city was in the zone of military operations by the British against the Turks, resulting in the surrender of Jerusalem, 10 Dec. 1917, after being in possession of the Mohammedans, with two brief intervals, for more than 1,200 years. (2) Samaria, the name also given to the kingdom of Israel and the subsequent Roman province forming the central portion of Palestine stretching southward from the Plain of Esdraelon, declining south of Hebron, into the desert plateau of Et Tih.

SAMARITAN LANGUAGE AND LITERATURE, the tongue and literary productions belonging to the inhabitants of Samaria, a region in Central Palestine of indefinite boundaries, possessing a capital of the same name.

Samaritan Language.—The Samaritan language was formed of varied elements gradually collected and assimilated from the Hebrew, Chaldee and Syriac. Greek, Latin, Persian and Arabic also contributed words to this dialect which grew up among a people isolated and even secluded in some respects, but through whose territory passed the immemorial trade route which connected Egypt and Africa with Assyria and the far East. Thus roots and heterogeneous scraps of language were jumbled together in the vernacular of an illiterate people, whose grammar was irregular, whose orthography was uncertain; there appears a complete confusion between the gutturals and cognate letters severally; quiescents or silent vowels prevail, and while vowel sounds are uncertain that of *a* is the most prominent. When the Arabians conquered Palestine in the 7th century this language gave place to that of the conquerors excepting among the priests, where it survived as the language of religion and ritual; thus it shared the fate of Hebrew among the Jews, Latin in Italy and the Roman provinces and Sanskrit in Hindustan. Like all Semitic languages it is read from right to left and the alphabet consists only of consonants, namely, *alaf*, *bith*, *gaman*, *dalat*, *i*, *ba*, *sen*, *it*, *tit*, *jud*, *kaph*, *labad*, *mim*, *nun*, *simcat*, *in*, *phi*, *sadi*, *goph*, *rish*, *shan*, *tav*. The two vowels with which certain words begin have a slight consonantal value. There are no accents or other diacritical symbols and no vowel points as in other Semitic languages, but some consonants are used as vowels. The numbers are written as in Hebrew. The characters appear in two forms, one of which is found in manuscripts, the other being confined to engraved inscriptions.

Samaritan Literature.—The literature of the Samaritan people consists of many departments, including grammar and lexicography. Three grammatical treatises on the Samaritan language were published from a manuscript at Amsterdam in 1862. They expound the theories of certain Arabian grammarians, from whose philological works whole passages are copied word for word. The Samaritan pronunciation may be judged of by the transliteration of Hebrew words into Arabic. No Samaritan lexicon has yet come to light. The lexicography, therefore, of the language is in an inchoate condition. The nearest approach to a glossary is to be found in the fragments of 'Tardeschemans' (interpreters) Hebrew-Arabic dictionaries now preserved in the Imperial Library at Saint Petersburg. There are also at Paris in the Bibliothèque Nationale des Anciens Fonds a concordance of forms occurring in the Scriptures with the Arabic and Samaritan words in parallel columns. The Imperial Library at Saint Petersburg also possesses some Samaritan calendars, or astronomical tables. In legendary lore are several extant manuscripts. The British Museum possesses a 'Commentary on the Legends ascribed to Moses,' which is largely a compilation from Jewish sources. Of a similar character is the 'Jewelled Necklace in

Praise of the Lord of the Human Race,' that is, Moses, who is credited with a divine nature, while great emphasis is laid upon the circumstances of his birth and the miracles he wrought. These two are typical of a somewhat extensive Samaritan legendary literature. The Samaritan commentaries on the Pentateuch are many in number and interesting as showing the doctrines of these people. It abounds in quotations from the Pentateuch, the prophets and the Mishna, and avoids all references to the Deity which imply an anthropomorphic conception. A number of fragments from the commentaries are also preserved at Saint Petersburg. The Samaritan 'Chronicle or Book of Joshua,' sent to Scaliger by the Samaritans of Cairo in 1584, seems to have revised and redacted into its present form about 1300 A.D. from four special manuscripts, three Arabic and one Hebrew, that is Samaritan. Among other things it relates that "King Joshua" waged war with 300,000 mounted men against two kings of Persia, and was succeeded on his throne by five "royal" rulers—the last being Sampson. The 'Chronicle of Abulfath' covers a period from Adam to Mohammed and is full of the wildest fables. Consult Uhlemann, 'Institutiones linguæ Samaritanæ' (Leipzig 1837); Petermann, H., 'Brevis Linguæ Samaritanæ Grammatica' (Berlin 1873); Gesenius, W., 'De Pentateuchi Samaritanæ indole' (Halle 1815); Brüll, A., 'Kritische Studien über Samaritanische Fragmente in Oxford' (Frankfurt 1875); Kohn, S., 'Zur Sprache, Litteratur und Dogmatik der Samaritaner' (Leipzig 1876); id., 'Samaritanische Studien' (Breslau 1868); Cowley, 'The Samaritan Liturgy' (Oxford 1909).

SAMARITAN PENTATEUCH, an ancient version of the books of Moses, which has been preserved by the Samaritans, and along with the book of Joshua, constitutes their sacred scriptures. The Samaritan Pentateuch is most probably a recension of the same original as that from which the Jewish came, and possesses an independent value in determining the text. It is written in a non-Hebrew character, probably older than that of the Hebrew Septuagint. A manuscript copy of the Samaritan Pentateuch is in existence which is said by the Samaritans to have been written by Abishua, the great-grandson of Aaron. There are various other manuscript copies of this version, besides a translation of it in the Samaritan vernacular and one in Arabic, which after the 7th century superseded Samaritan as the language of the people. The work was known only through Origen, Jerome and other early writers until Pietro della Valle discovered a copy of it at Damascus in the 17th century. There are now several printed editions. See SAMARITAN LANGUAGE AND LITERATURE.

SAMARITANS, so called from the city of Samaria, the capital of the kingdom of Israel, and from Samaritis, the region adjoining that city. The policy of the Israelitish kings was, as a rule, to keep their subjects apart from too close association with the kingdom of Judah, and the breach between the two peoples was made wider, when, after the captivity of Israel, Assyrian colonists intermarried with the remnant left behind by the conquerors, and the

Samaritans ceased to be of purely Hebrew descent. The New Testament shows the aversion with which they were regarded by the Jews in the time of Christ, and even to this day when the Samaritans are represented by a few families still worshipping at Mount Gerizim, the dislike with which the Jews look upon them is as strong as ever. The Samaritans claim to be purely Mosaic in their creed, and that the Jews have departed from the ancient teachings of Israel. They worship one God, practise circumcision and the purifications, and keep the feasts, except the Purim and the feast of the Dedication. They look for a Messiah and believe in a resurrection from the dead and retribution in a future life for wrongs done in the present one. They marry among themselves only and practise polygamy in a limited degree. See also JEWS AND JUDAISM; JEWISH SECTS.

SAMARKAND, sām-ar-kānd' (ancient, MARCANDA), Turkestan, Asiatic Russia, chief town of the province of the same name, and formerly capital of Sogdiana, in a fertile valley, 130 miles east of the city of Bokhara. The citadel stands at the west and beyond is the newly-built town. The Righistan, or main square, is of unrivaled beauty in its architectural features. The principal buildings are a palace, the bazaars, the Ulg-beg *madrassa*, or college; the tombs of Timur and his wives; two other colleges of the 17th century—splendid buildings, highly decorated with arabesques, enameled tiles of various colors, rich marble, and inscriptions of gold, etc., and 250 mosques. There is a brisk trade, and the chief items of commerce are cotton, silk, wheat, rice, horses, asses, fruit and cutlery. Gardening is the principal occupation, and there is some manufacturing. Wheat, rice and silk are exported, chiefly to Bokhara; silkwares, fine fruits, and rock-salt are imported. Samarkand has been for more than two centuries a great Asiatic mart. As Marcanda, it was taken by Alexander the Great; Timur made it his capital and in his time it contained a population of 150,000. In the 15th century it was celebrated as a school of astronomy and mathematics. It had a checkered history; taken in 712 by the Arabs, who introduced the creed and customs of Islam, it finally fell into possession of the Russians in 1868. Pop. of city (1910) 94,650; province (1914) 1,198,000.

SAMARSKITE, a rare and exceedingly complex, velvet black, nearly opaque mineral, occurring mostly massive, rarely in crystals. It is distinguished by its dark reddish-brown streak, splendid, vitreous to resinous lustre and conchoidal fracture. Its hardness is 5 to 6, specific gravity 5.6 to 5.8. Its usually rough crystals are retangular prisms of orthorombic symmetry. It is a niobate (and tantalate) of iron uranium, and the cerium and yttrium metals. It is chiefly remarkable for the large number of rare metals which it contains, including samarium, terbium, gadolinium, and the doubtful mosandrum, decipium and phillipium. Its only European locality is Miask, Russia, but it is found sparingly in Canada, also in the United States in Connecticut, Maryland and Colorado. The only localities of commercial importance are in North Carolina.

SAMBOURNE, sām'born, Edward Linley, English cartoonist: b. London, 4 Jan. 1845; d. 3 Aug. 1910. He was educated at the City of London School and Chester College, and at 16 became an engineering draughtsman. In 1867 Mark Lemon, editor of *Punch*, accepted a small drawing from his hand, and he soon formed the connection that lasted through life. In 1871 he was given a seat at the table and in 1901 he succeeded Sir John Tenniel as chief cartoonist. He had practically no artistic education, but developed for himself an original style after first showing some inclination to the methods of Leech and Keene. He displayed ingenuity and firmness of touch, and a classic feeling for line. He was perhaps the least humorous of the *Punch* artists, being weighted with a strain of seriousness and dignity. He illustrated Burnand's 'New History of Sanford and Merton' (1872); Kingsley's 'Water Babies' (1885); 'Hans Andersen's Fairy Tales' (1887), etc.

SAMBRE, sänbär, river of France and Belgium, a tributary of the Meuse. It rises in the northern part of the French department of Aisne, flows between steep and rocky heights, receives several smaller streams, and finally, after a very tortuous course, empties at Namur into the Meuse. The Sambre is 110 miles long. It is navigable from Landrecies for 148 kilometers, and from that point for 67 kilometers is canalized, having 10 locks. The Sambre Canal passes southward as far as Oise, connecting the Seine and Maas. Practically the vicinity of the entire length of the river in France formed a vast battlefield after the Teutonic armies had invaded France in the early part of the great World War.

SAMBUKE, an ancient musical instrument; though applied sometimes to several musical instruments of different kinds, such as a lyre, a dulcimer, a triangular harp or trigon and the large Asiatic and Egyptian harps.

SAMBUR, a large deer (*Cervus unicolor*), widely distributed throughout southeastern Asia, and especially the hill country of India and the species of most importance to the sportsman. Large bucks approach five feet in height at the withers, and may exceed 500 pounds in weight. The antlers are large and rough, have the brow-tine sprouting at an acute angle with the beam instead of at or near a right angle, and dividing into two subequal tines at the extremity; the beam sometimes exceeds 40 inches in length in fine specimens from the Bay of Bengal. The color is properly a uniform deep brown, but paler and less handsome hues are often seen; the hair is long and wiry, and forms an erectile mane on the necks of full-grown stags. This deer is an inhabitant of the woodlands, coming out to graze on the hill-slopes, at times, for like the wapiti it subsists mainly upon grass and herbage, but never far from a refuge in the jungle; yet at certain seasons browses the new twigs, or seeks for fruits. There is great variety in their circumstances and habits throughout the wide area of the distribution of this species, and consequently a puzzling amount of variation in their form and appearance, so that several separate species have been without good reason, as further study has shown. Consult Blanford, 'Mammals of India' (1888); Lydekker, 'Deer of All Lands' (1898).

SAMBUR (*Cervus Unicolor*)

SAMIAN WARE, the name of a kind of ancient Greek pottery made of Samian earth, or to a variety of Roman pottery made in imitation of this. The vases are of a bright red or black color, covered with a lustrous silicious glaze, with separately molded ornaments attached to them.

SAMNITES, an ancient people sprung from the Sabines, and inhabiting the province of Samnium, in Lower Italy. They were divided into four nations: 1, the Caraceni in the north, capital, Aufidena; 2, the Pentri in the centre, capital, Bovianum, who constituted the most powerful nation of the Samnite stock; 3, the Caudina in the southwest; 4, the Harpini in the south, capital, Beneventum. The Samnites are described in Roman history as a people fond of war and of liberty, who were brought completely under the Roman yoke after long and bloody wars, which continued with few interruptions 53 years. After the most fatal defeats, and the entire devastation of their country, the Samnites, together with the other nations which had assisted them, found themselves obliged to submit to the supremacy of Rome, 290 B.C. When the Italian allies of Rome revolted against her in the year 90 B.C. the Samnites once more rose against their oppressors, and fought with desperation. But Sulla entirely subdued them, and commanded that every Samnite should be put to death. Three days after the battle he ordered 4,000 of them who had been taken prisoners to be put to death on the Campus Martius. The few that remained lived from that time scattered in villages. The Samnites cultivated various arts and manufactures, for the proximity of the refined Greeks in Lower Italy had a very beneficial influence upon them. Even their laws and constitution were borrowed in a great degree from the Greeks. Their form of government was democratic. At the commencement of a war they were accustomed to choose a common general.

SAMOA DISASTER, *The*. See SAMOAN ISLANDS.

SAMOAN ISLANDS, *The*, or **SAMOA**, formerly known as the Navigator Islands, an important group in the South Pacific Ocean, belonging till 1914 partly to Germany and partly to the United States. They are about 2,000 miles south of the Hawaiian Islands, in an almost direct line between San Francisco and Australia and extend from about lat. 13° to 15° S., and from long. 168° to 173° W. They lie 2,410 miles north of Auckland, New Zealand, and about 4,200 miles southwest of San Francisco. The group comprises 14 islands, of which only Savaii (700 square miles), Upolu (500 square miles), Tutuila (200 square miles) and the Manua group (26 square miles) are important. The total area is about 1,700 square miles. The climate is tropical, with abundant rainfall and a mean temperature of 80° in December and 70° in July.

All the islands are peaks of a submarine chain of volcanic mountains. Barrier reefs encircle the large islands more or less, and especially Upolu. Brown and bare in many places at low water, the reefs are submerged at high tide, when the surf booms and bursts upon them in miles and miles of snowy whiteness. Between the outer reef and the shore stretches a lagoon of multi-tinted waters, varying in

width from 200 yards to two and three miles. This generally smooth belt of water is, in effect, a canal encircling the islands and is the highway along which all intercourse is had between different points of the islands. In the interior lofty mountains rise, leaving broad stretches of comparatively level land bordering the shore and reaching up to low-lying foot hills. Water courses extend down the mountain side through which the tremendous rains, turning into furious torrents in a few minutes, have cut great ravines. In many places the sides of the mountains are not far from perpendicular. Yet such is the climate that they are held in place by the network of growth that covers them. Over such a surface is spread a tropic forest of often giant trees.

Savaii, the most westerly member of the Samoan group is much the largest and most rugged. It is ridged with lofty, cloud-encircled mountains that are covered with a mantle of dense tropical foliage, giving to them an evenness of outline that delights the eye of the newcomer. The interior of the island, which has never been explored and concerning which little is known, is wholly occupied by mountains. Only a small strip of alluvial land bordering the shore is productive and the island is capable of sustaining a small population. Ten miles east of Savaii is Upolu, in many respects the most attractive island of the group. Its centre is occupied by a range of hills, the sides of which are covered with vegetation and slope gently down to the sea with many intervening valleys and broad plains. The soil of these slopes is for the most part stony. A comparatively small part of it can be cultivated, but on the lower foot-hills it is largely alluvial and consequently very fertile. Here all the productions of the tropics grow in abundance and the gentle, half civilized natives have made their villages and plantations, where they spend an indolent life, with a minimum of care and labor. Upolu has no perfectly sheltered harbors except those of Apia and Saluafata, upon the north coast, which are anchorages of considerable area. They afford convenient shelter from the easterly trade winds and for the most part are perfectly safe, except during the hurricane season, which includes the months of December, January, February and March. At this time, these anchorages, being opened to the north, are exposed to the full fury of the cyclonic storms that annually traverse this region, and blow most heavily from that direction. Upon such occasions great losses occur. Ships are driven ashore, where they break up on the coral reef; sometimes they go down at their anchors. About 40 miles off the eastern coast of Upolu lies Tutuila, on the south side of which is Pango-Pango harbor. This is the only land-locked anchorage in the group and affords protection in all kinds of weather to the largest men-of-war or ocean vessels. The land around the harbor is level and well adapted for wharves, warehouses or other structures. It is more suited to steamers than to sailing vessels, since the heavy trade winds sometimes blow directly into the entrance, making it difficult for vessels under sail to leave it. But as a harbor for steamships it probably has no equal among the thousand islands of the Pacific. It lies, moreover, directly in the great circle track between Australia and America, and is, there-

fore, a convenient calling place for vessels traversing the Pacific.

Within the sea reef of Upolu lies the island of Manono, little more than a barren rock, which has played a great part in the domestic history of the group. It has always been the cradle of a feudal aristocracy and the focus of native politics. Its chiefs have held a commanding influence in all Samoan affairs. The Manua Islands, three in number and of small area, are 60 miles east of Tutuila. Although they are properly classed with the Samoan group they have little in common with the three larger islands already mentioned save in their language and origin.

The Samoans belong to the so-called brown people or Malayo-Polynesians. Although they have always been considered as having affinities with the Malays of the Indian Archipelago, nothing is positively known about their origin. That they are a branch of the Malay race or family is not much questioned and they are also remotely allied to the Malagasy of Madagascar. The parent race has disappeared; but that branch from which the Samoans are descended was one of its earliest offshoots, and having remained almost free from admixture of blood, nearly represents the original. They trace back directly to the great Aryan family

melancholy air and meekness which Humboldt first pointed out as a characteristic of the islanders of the Pacific. Their skin is dark olive, resembling polished copper, presenting no difference in the sexes, though the prominent chiefs and better families are much lighter, with smoother skin. They are also taller and more symmetrical in person than the common people. The infant is much lighter in complexion than the adult. The male Samoan is tall, erect and proud in bearing, with smooth, straight and well-rounded limbs, the contour seldom presenting muscular protuberance or development. Females are generally slight, especially the young girls; erect and symmetrical, easy and graceful in their movements, the charm of light-heartedness seeming to follow every action. Beauty of feature is not the rule; though many of the village maids are exceedingly attractive.

The Samoans build primitive houses, stone fences and canoes, and in war time dig ditches, throw up earthworks and construct forts and palisades. They cultivate the yam and taro and to some extent, since the advent of the whites, collect cocoanuts and make copra; they manufacture cloth and mats and engage in fishing and in collecting the food that nature offers to them freely for the gathering. The fale-

Map of Samoan Islands.

and their ancestors centuries before the present era emigrated from India and established themselves in the Indian Archipelago, whence they afterward pushed further on into the Pacific. Never having been subject to the inroads of other alien races, and the consequent admixture of blood, the Samoans have preserved uncorrupted and unchanged many of their original racial characteristics. They are of splendid physique, handsome, bright, strikingly erect, sound, healthy, vigorous and of tremendous strength. Many of the distinctive marks of the European appear in their faces, giving that

teles or council houses features of all the villages, in many instances are of imposing dimensions. The houses are built of the wood of the bread-fruit tree. They are slightly oval, some 25 or 30 feet high. In building them three centre posts are raised, which support a ridge pole, while cross beams are lashed in at different heights, thus binding the structure firmly together. A thatching of sugarcane or pandanus leaves covers the roof. Large houses generally have prominent sides; the smaller ones are open all around, but are curtained by mats.

The first Christian missionary visited Samoa in 1830. In 1903 nearly every native had embraced the Christian religion. Food is collected on Friday and prepared on Saturday. On the Sabbath scarcely a boat is to be seen; the hunter is never in the woods. Attendance upon church meetings affords almost the only sign of life; even the sports of the children are sacrificed, in a large degree, to the strict observance of the day. To a stranger the villages seem deserted. Three denominations have been established in Samoa and there has been strong rivalry between them. All the churches have good schools, those of the London Missions and of the Catholic Church being especially well conducted and prosperous. At Malua, on the coast of Upolu, 12 miles to the west of Apia, the London Missionary Society maintains a settlement or college founded by the Rev. Dr. Turner. The establishment consists of a house for the principal, or resident missionary, a large building which is used as church and schoolroom, and a number of cottages standing in regular order round an open place or square. At Leulumoenga is a college, established about 1890 for the purpose of educating the sons of the chiefs and of teaching them English. Roman Catholics took the initiative in teaching English. The Protestant missionaries, at first, declined to admit natives who desired to learn English into schools attended by whites and half-castes, nor would they teach English in the native schools. Later they erected near Apia a fine high school or college for Samoan girls of the upper class.

In education the Samoans have displayed quite as marked proficiency as in their assimilation of Christianity. Probably fully one-half of all persons over 20 years of age can read and write. Under that age, all of both sexes, with but few exceptions, are educated to that extent. Beyond this, and the addition of elementary arithmetic, education does not extend, save to those in the mission schools, who are preparing themselves for the ministry. Samoans are keenly alive to all the advantages of education. Every village, without exception, has its resident pastor, or *faife'au*. This person is at once minister and teacher, regularly teaching the village school besides attending to his ministerial duties. In like manner each village is provided with a building that serves for the purpose of schoolhouse as well as church.

Cotton, sugar, coffee and cocoanuts are the leading articles of trade in the islands. The copra of commerce is obtained by drying the kernel of the cocoanut, the copra, which is exported to Europe and the United States, where it is used in the manufacture of coconut oil.

History.—The islands were first visited by whites in 1721. The French explorer, De Bougainville, named the group in 1768. In 1787 John F. G. de la Prouse spent several weeks in and around the islands; his experiences with the natives were not altogether agreeable, for on the island of Tutuila Captain de Langle, the second in command of the expedition, with several sailors, was massacred. In 1839 the famous expedition of Commodore Charles Wilkes, of the United States navy, made the first thorough survey and exploration of the principal islands of the group. Wilkes also negotiated an agree-

ment with the principal chiefs by which the interests of the natives and the whalers and traders visiting the islands from time to time were provided for. He appointed a consul to represent the United States and took measures to insure amicable relations in the future between the islands and the United States. This agreement was the beginning of treaty connections between the Samoans and the outside world. A third of a century elapsed after Commodore Wilkes' visit before anything more formal or important developed in the relations of the islanders to the United States or to any European nation. Notwithstanding the steady development of commercial interests in the islands, no serious attempts were made by any nation to obtain a footing in Samoa. During this entire period, however, the islanders had a friendly disposition toward the United States, and later a coaling station at Pango-Pango was secured by the American government. The native government of the islands had been from time immemorial under the two royal houses of Malietoa and Tupea except on the island of Tutuila which was governed by native chiefs. In 1873 at the suggestion of former residents a house of nobles and a house of representatives were established, with Malietoa, Laupepa and the chief of the royal house of Tupea as joint kings. Subsequently Malietoa became sole king. In 1887 he was deposed by the German government on the claim of unjust treatment of German subjects, who formed the bulk of the foreign population of the island, and was deported first to German New Guinea and then to Kamerun, in Africa, and finally in 1888 to Hamburg. Tamasese, a native chief, was in the meantime proclaimed king by the Germans, though against the protest of the British and American consuls at Samoa. Mataafa, a near relative of Malietoa, made war on Tamasese and succeeded to the throne.

Meanwhile a commercial treaty was negotiated between a representative of the Samoan government and the United States Secretary of State, William M. Evarts, by which the claim of the United States to the harbor of Pango-Pango as a coaling and naval station was affirmed. Germany followed in the footsteps of the United States in negotiating a treaty, securing to that country practical control of the harbor of Saluafata. The same treaty also gave the Germans unusual commercial privileges and exceptional power in the adjustment of affairs between German residents at Apia and the Samoans. Great Britain also concluded a treaty, securing a naval station and coaling depot and other privileges.

In 1889 a conference between the representatives of the American, British and German governments was held at Berlin, at which a treaty was signed by the three powers guaranteeing the neutrality of the islands in which the citizens of the three signatory powers would have equal rights of residence, trade and personal protection. They agreed to recognize the independence of the Samoan government and the free rights of the natives to elect their chief or king and choose a form of government according to their own laws and customs. A Supreme Court was established, consisting of one judge styled the Chief Justice of Samoa. To this court were referred all civil suits con-

cerning real property situated in Samoa; all civil suits between natives and foreigners or between foreigners of different nationalities; all crimes committed by natives against foreigners or committed by such foreigners as are not subject to any consular jurisdiction. The capital was located at Apia. A commission was appointed to investigate titles to land alleged to have been purchased from the natives, and this in 1894 completed its labors, confirming about 75,000 acres of land to Germany, 36,000 to British and 21,000 to Americans.

By the agreement of 2 Dec. 1899 the Samoan Islands were divided between the United States, Germany and Great Britain. The latter, however, traded her claims to Germany for certain concessions in Africa and other places. Under this agreement the United States retained Tutulia and all other islands of the Samoan group east of longitude 171° west of Greenwich, while Germany obtained all the Samoan territory to the west of American holdings. The king of Norway and Sweden was made arbitrator to determine and adjudge the amount of claims due to citizens and subjects of British, German and American governments having possessions on the islands and affected by recent military operations there. German Samoa was administered by an imperial governor and a native chief assisted by a native council, while the American possessions were placed in charge of a naval governor. Shortly after the opening of the European War in 1914, an expeditionary force of New Zealanders captured German Samoa. By the terms of the Peace Treaty of May 1919 the German portion was placed under the administration of New Zealand. The German and the American fleets suffered very severely from a sudden tempest in the roadstead of Apia on 16 March 1889. The American losses were the *Trenton* and the *Vandalia*, and 52 men; the German losses, the *Adler* and the *Eber*, and 134 lives. A volcanic eruption in the interior of Savaii, which began in August 1905, continued until 1909, thus forming the greatest known volcanic disturbance in the world's history.

SAMOKRISCHTCHINS. See RELIGIOUS SECTS.

SAMOS, sā'mōs, now **SAMO**, or **SOU-SAM-ADASSI**, an island in the Ægean Sea belonging to the Grecian Archipelago. It is 45 miles southwest of Smyrna, and is separated from the coast of Asia Minor by a narrow channel, Little Boghaz, and from Nikaria and the Furni Islands by the Great Boghaz. It covers an area of 213 square miles and has several good harbors on the coast; it is traversed by two rocky and barren mountain ranges, relieved by some forests of pines, with vineyards and olive groves on the lower slopes. The valleys are well-watered and fertile, and contain beautiful scenery. The capital and chief

city is Vathy, on the north side. The old capital, Khorā, is a poor place on the south side. This was the site of the famous temple of Hera. The island is extensively cultivated, produces excellent Muscadine wine, corn, fruit and vegetables. The minerals include silver, lead, antimony, calamine, manganese and copper. Samos is renowned as the birthplace of Pythagoras and other distinguished men. It was formerly inhabited by Ionian Greeks. The chief exports are wine, brandy, raisins, hides, leather, oil, tobacco and carob-beans. Samos was constituted a principality under Turkey, with the guarantee of France, Great Britain and Russia, 11 Dec. 1832. In November 1912 the island was seized by the Greeks and has since been held by them. The question of the Ægean Islands was further complicated by the Great War and local changes, and had not been settled by the middle of 1918; therefore Samos was still under Greek rule.

SAMOSATENES, or **SAMOSATIANS**, a heretical sect, followers of Paul of Samosata, bishop of Antioch, from 260 to 274 A.D. He denied the divinity of Jesus Christ, saying Jesus was simply man, though favored with the indwelling of the Logos from the instant of his conception: by the unvarying conformity of his will to the Divine will, he became like unto God, and through love he became one with him. His doctrine was condemned as impious by three councils of bishops, the third of which by decree deposed him, 269 A.D.; but Paul would not comply with the decree, till at last, after the overthrow of his great patron, Zenobia, queen of Palmyra, it was enforced by order of the Emperor Aurelian, 274 A.D., who declared that the controversy had been determined by the judgments of the bishops of Italy, and in particular the bishop of Rome. The Samosatenes are also called Paulinians and Paulinists.

SAMOTHRACE, sam o-thras, or sā-mō-thrā'sē, or **SAMOTHRAKI** (Turkish, Samadrek), an island of the Ægean Sea, about 40 miles northwest of the entrance to the Dardanelles, and nearly opposite the mouth of the Hebrus, 36 miles from the coast of Thrace. It is rugged and mountainous and of almost oval form; its highest summit, Saoce, reaches an elevation of 5,248 feet. On the northern coast are sulphur springs of considerable renown. The principal products are grain, wood, oil, honey and wax, and on the coast there is a considerable sponge fishery carried on by traders from Smyrna. In the northern part of the islands the ruins of ancient Samothrace were found (1873-75), consisting of Cyclopean walls; a Doric temple of marble and another of circular form. Samothrace was of importance from early times and is frequently mentioned in the works of Pliny, Homer and others. Here Poseidon witnessed the contests between Greeks and Trojans on the plains of Troy. But its chief renown was due to its having been the seat of worship of the Cabiri, and to its religious mysteries, supposedly derived from the Pelasgians. The island is once mentioned in history in connection with the expedition of Xerxes, one of its ships having taken a conspicuous part in the famous battle of Salamis. The island was first colonized by Phœnicians, afterward joined by Greeks. It always en-

joyed autonomy, partly owing to its sacred character, partly to its lack of political importance—due to the fact of its having no good harbor. Saint Paul visited the island in the course of his second missionary expedition (Acts xvi, 11). The inhabitants are mostly Christians. Pop. 4,600. Samothrace, with all the other Ægean Islands, was in the possession of Greece and Italy in 1918, pending a definite arrangement with regard to their future control.

SAMOVAR, a Russian tea kettle, the water in which is boiled by means of hot coals contained in an iron tube, and then poured over the tea.

SAMOYEDES, sām'oi-dēz, or **SAMOIEDS**, a Mongolian people inhabiting the shores of the Arctic Ocean, from the Kanin Peninsula, on the eastern shores of the White Sea, in European Russia, to the Gulf of Khatanga, in the northeast of the government of Yeniseisk, Siberia. They consist of three principal tribes, speaking different dialects. Their origin is unknown, but they are supposed to have come from more southern regions, and have been erroneously confounded by the Russians with the Laplanders, whose country, called in the Lapland tongue, Sameanda has probably given them their name. They are nomadic and live chiefly by fishing, hunting and keeping reindeer. Their principal wealth consists in herds of reindeer, which supply them with food, clothing, tents, utensils, etc. They are of small stature, usually between four and five feet; have a flat, round and broad face, thick lips, wide nose, little beard, black hair, in small quantity. They are extremely superstitious and generally peaceable. They are unacquainted with the art of writing, their traditions being imperfectly preserved only in their songs. When Russian expansionists first became acquainted with them they had already been driven from their native seats by the Tartars, and separated from their kindred tribes.

SAMP, originally an Indian article of food consisting of maize, broken or bruised, which is cooked by boiling and eaten with milk.

SAMPAN, a boat of various build used on the Chinese rivers, in Straits Settlements and elsewhere, for the conveyance of merchandise, and also frequently for habitation. They are swift sailers both with oar and sail.

SAMPHIRE, an umbelliferous plant (*Crithmum maritimum*), pale-green with bi-triternate leaves and fleshy very succulent leaflets, and umbels of small yellowish flowers followed by fennel-like fruits. It grows wild along the rocky shores of northwestern Europe, near the water, and when abundant, is used as a pickle, salad or potherb. It can also be cultivated in gardens, if not too far from the coast, and if supplied with plenty of salt and soda solutions. The name is a corruption of the old French "herbe de Sainte Pierre," and it is also called in England Saint Peter's-wort.

SAMPLE, Robert Fleming, American Presbyterian clergyman: b. Corning, N. Y., 19 Oct. 1829; d. New York City, 12 Aug. 1905. He was graduated from Jefferson College in 1849. From 1853 he was engaged in various pastorates in Pennsylvania and Missouri until 1887 when he assumed charge of the Westminster Presbyterian Church, New York, where

he remained and was pastor emeritus from 1902 till his death. He was professor of Christian ethics in Lincoln University, was editor of 'North and West' in 1895-1902, traveled widely in Europe and Palestine, and was connected with numerous religious educational and religious organizations. He published 'Early Dawn' (1861) 'Memoir of Rev. John C. Thorn' (1868); 'Beacon Lights of Reformation' (1889); 'Elements of Pulpit Power' (1901), etc.

SAMPLERS. A strip, or square of linen, or canvas, recording specimen stitches and patterns, was, for hundreds of years, worked by every young girl of aristocratic and well-to-do families. The sampler had the double value of giving the child skill as she worked it and of serving as a guide and source of reference all the rest of her life. The sampler ceased to become a part of education in the middle of the 19th century. After 50 years of oblivion, it came into prominence in a new way, to enjoy fame by appealing to the fancy of the collector. The first and finest collection was made by the late A. W. Drake and is now scattered. A splendid collection is in the South Kensington Museum, London. Although no earlier examples exist than the 17th century, the sampler, which is nothing more nor less than a pattern-book for the embroiderer, is probably as old as the art of embroidery (q.v.) itself.

The embroiderer was seldom the designer of the decoration that grew beneath her needle. The sampler was, therefore, a kind of notebook (corresponding to the artist's sketch-book), exhibiting various stitches and suggestions for embroidery, or for making cross-stitch letters, numbers, patterns, etc. It was, consequently, of both artistic and practical value. The name tells plainly what it is.

Chaucer uses the word *ensampler* as a synonym for pattern, and the poet Skelton (1469-1529) speaks of "the sampler to sew on, the laces to embraid." The inventory of Edward VI (1552), mentions "a sampler, or set of patterns, worked in Normandy in green and black silks." Shakespeare mentions it twice—in 'A Midsummer Night's Dream,' when Helena reminds Hermia that they worked together on a sampler, and in 'Titus Andronicus' in reference to the Greek story of Philomela. From the 16th century samplers are constantly met with in records and diaries and even in wills, for they were deemed worthy of special bequest. Samplers of the 16th and 17th centuries often contained insertions of reticella or cutwork (see LACE), drawn-work and patterns for needle-point lace; for although pattern-books of lace were published, they were hard to procure and the supply was limited.

The evolution of the sampler is as follows: First, the sampler consisted of decorative pictures thrown here and there upon the surface of a piece of canvas; then came designs placed in orderly rows and making in themselves a harmonious whole; next, alphabets and numerals chiefly for the use of these who marked the linen; and next, imitation of tapestry pictures by the addition of figures, houses, birds, animals and flowers. Last of all the sampler was adopted as an educational task in a dame's school as a specimen of a pupil's phenomenal achievement at an early age.

The sampler was used in all European countries; and beautiful specimens of Spanish, French, Italian, Dutch and German work exist. To us the English examples are the most interesting because the American samplers are English in character of workmanship and design.

The earliest of all known samplers is in this country. It is owned by the Essex Institute in Salem, Mass., and was worked by Ann Gower, the first wife of Governor Endicott. She came to Salem in 1628 and died in 1629. The sampler was, of course, worked in her girlhood in England. The upper part consists of the alphabet and the lower contains examples of needle-work. Another early sampler, worked by Loara Standish, daughter of Captain Miles Standish, is preserved in Pilgrim Hall, Plymouth, Mass.

The age of a sampler is told by the character of the designs and lettering, coloring, border and insertions. The earliest samplers are long and narrow. A conventional strawberry and oak leaf, or acorn, appears in almost every 17th century sampler. The rose is very frequent, but is not so much used as the "Persian pink," or carnation.

The curious human figures with outstretched arms, known as "Boxers," appear between 1648 and 1742. When they disappear, their place is taken by Adam and Eve in the garden of Eden. During the early part of the 18th century the sampler consisted exclusively of long sentences worked in silks of every imaginable hue. A peculiar mustard-colored linen was introduced as groundwork for the stitches after 1700. Toward the middle of the century blues, greens, yellows and blacks were the prevailing colors for the silks. The stag, which had appeared but rarely before 1700, now became the fashion and continued to be worked as long as samplers were made. About 1728 the border encircled the whole sampler; and it is noticeable that as the variety of patterns decreased the sampler became shorter. From 1740 onward the border always appears and the sampler is a picture instead of a pattern-sheet. Next, the border develops into a wreath of naturalistic flowers. A few dates of decorations will aid the curious in determining the period of any sampler. Alphabets, name of the maker, rows of ornaments, stag (occasionally), and Boxers date from 1648; numerals, 1655; inscriptions, 1662; crown, 1691; motto or text, 1686; verse, 1696; Adam and Eve, 1709; border, 1726; floral border, 1730; fleur-de-lis, 1742; flower in vase, 1742; heart, 1751; stag (commonly used), 1758; house, 1765; mustard-colored canvas, 1728; Spies to Canaan, 1804; crewels replace silk, 1820.

The inscriptions consist of moral sayings, allusions to death and its terrors, hymns, melancholy and lugubrious verses and quotations from the Bible. Sometimes an entire Psalm was worked in letters as clear and neat as those of a printer. The plodding needle also took for its task the Lord's Prayer, or the Ten Commandments. Sometimes, too, the sampler was worked with the names and dates of birth and death of an entire family, proving once again that needlework occasionally fulfilled its ancient purpose of recording events. See EMBROIDERY.

In the 18th century maps were worked on samplers in the dame's schools for the double purpose of teaching geography and needlework. Many of these survive. Darning samplers were

made in the 19th century. These show various kinds of darning stitches suitable for mending certain textiles, and are arranged in circles and squares around a basket, or a vase of flowers. Consult Huish, Marcus B., 'Samplers and Tapestry Embroideries' (London 1900); Jourdain, M. A., 'English Secular Embroidery' (London 1910); Earle, Alice Morse, 'Home Life in Colonial Days' (New York 1898), and 'Child Life in Colonial Days' (New York 1899); *Century Magazine* (1912).

SAMPSON, Archibald J., American diplomat and author: b. near Cadiz, Ohio, 21 June 1839. He was graduated from Mount Union College, Ohio, in 1861 and from the Cleveland Law School in 1865; served through the Civil War in the Union army, starting as private and attaining the rank of captain; was admitted to the bar in 1865 and settled in Sedalia, Mo., where he engaged in the practice of law. There he was successively city, county and district attorney. He removed to Colorado in 1873, locating in Canyon City and establishing his law practice. There he was again county attorney and in 1876 was elected attorney-general of the State. In 1889 President Harrison appointed him American consul at Paso del Norte, Mexico. On leaving there he located in Phoenix, Ariz. In 1897 President McKinley appointed him Envoy and Minister of the United States to the republic of Ecuador, where he remained until 1907, being the first person for over 60 years living in a territory to receive a diplomatic appointment. Since his return to the United States he has spent a good part of his time lecturing on "Masonry as seen in Foreign Lands," and other subjects. Mr. Sampson is past department commander, Arizona Department of the G. A. R.

SAMPSON, Deborah, American heroine: b. Plymouth, Mass., 17 Dec. 1760; d. Sharon, Mass., 29 April 1827. She served in the Continental army for three years during the Revolutionary War, disguised as a man and bearing the name of Robert Shurtleff. She gained a reputation for coolness and courage in action and was engaged in many daring enterprises. She was wounded by a sabre cut on the temple in a skirmish near Tarrytown and later was shot through the shoulder. During the Yorktown campaign she was seized with brain fever and her sex was discovered. She was discharged by Washington, receiving from him a note and a purse of money and later was invited to the capital, where Congress voted her a pension and a grant of lands. She published her experiences under the title 'The Female Review' (1797; new ed. with introduction and notes by Rev. John A. Vinton, 1866).

SAMPSON, William Thomas, American naval officer: b. Palmyra, N. Y., 9 Feb. 1840; d. Washington, D. C., 6 May 1902. In 1860 he was graduated from the United States Naval Academy, where he had been the highest officer of the cadet battalion. His first assignment was on board the frigate *Potomac*. He was promoted lieutenant, 16 July 1862 and two years later became executive officer on the ironclad *Patapsco* of the South Atlantic blockading squadron. He held the watch, 15 Jan. 1865, on the turret roof of the *Patapsco* when that vessel was blown up and sunk by a torpedo in Charleston Harbor. Only his own coolness

saved his life in that catastrophe. He became lieutenant-commander in 1866 and commander in 1874. In the autumn of the last-named year he was detailed for the third time as instructor at the Naval Academy and remained there four years in charge of the department of physics. Later he became assistant superintendent of the Naval Observatory, and in 1884 was a member of the International Prime-Meridian and Time Conference at Washington. He was superintendent of the torpedo station at Newport, 1885-86; representative to the International Marine Conference at Washington in 1886, and superintendent of the Naval Academy 1886-90, where he introduced great improvement in the state of training. In 1889 he was promoted captain and later put in command of the *San Francisco*, the first steel cruiser of the new navy. During his term as chief of the Bureau of Naval Ordnance, 1893-97, the use of smokeless powder was perfected by experiments conducted under his supervision. Upon quitting this post he was put in charge of the battleship *Iowa*, which had been placed in commission in June 1897, and with this ship he took his place as senior captain in the North Atlantic squadron. On 17 Feb. 1898, two days after the battleship *Maine* was blown up in Havana Harbor, he was appointed president of a board of inquiry directed to investigate the causes of that disaster. On 22 March the investigation was concluded and Captain Sampson, promoted to the rank of acting rear-admiral, succeeded Admiral Sicard in command of the North Atlantic squadron. Upon the declaration of war with Spain, 21 April, he was ordered with his fleet to blockade the northern coast of Cuba. A few days later the Navy Department was informed of a Spanish fleet under Admiral Cervera having sailed from the Cape Verde Islands toward Cuba. Admiral Sampson was forthwith ordered to intercept this fleet in its supposed progress to the relief of Havana. On 1 June he arrived off Santiago, where the Spanish fleet had meantime been located and at once effected a strict blockade. On 3 June, under his orders, an unsuccessful attempt was made by Naval Constructor R. P. Hobson and others to prevent egress of the Spanish fleet by sinking the *Merrimac* in the channel entrance to the harbor. On the morning of 3 July Sampson had withdrawn on the flagship *New York* and was proceeding to Siboney for a conference with General Shafter, the commander of the land forces, when it was discovered that the Spanish ships were leaving the harbor of Santiago. The *New York* was put about and, under full steam, overtook the blockading fleet already giving battle under the direction of Commodore Schley, commander of the flying squadron and second in command of the blockading fleet. The entire Spanish fleet was destroyed and Admiral Cervera was captured. After the close of the war a long and bitter newspaper discussion ensued over the question whether the chief honors of this victory belonged to Sampson or Schley. A court of inquiry which met three years later, at the request of Schley, decided against his claims, but the controversy prevented Congress from awarding any official recognition to Sampson for his success. For two years from October 1899 Admiral Sampson held command of the Boston Navy Yard. In October 1901 he was

placed on waiting orders; his health was much impaired; he was retired from active service 9 Feb. 1902, and resided in Washington until his death.

SAMSHUI, China, a treaty port in the province of Kuang-tung, situated on the river West, about 100 miles west of Canton. The town is small, but favorably situated for foreign trade.

SAMSON, one of the judges over Israel. He was of the tribe of Dan, and the circumstances attending his birth, heralded as it was by an angel, his consecration as a Nazarite, and those visitations of the Spirit of the Lord through which he was enabled to perform feats of heroic might, marked him out as a man raised up to meet a national emergency. The first recorded instance of the exercise of his great strength is in connection with his marriage to a daughter of the Philistines. At the wedding-feast Samson proposed a riddle to the guests, wagering 30 shirts and as many suits of clothes that they could not guess it in seven days. The secret of his riddle being betrayed to them by his wife, Samson went to Askalon, killed 30 Philistines and gave their clothes to his guests. His wife having, during his absence in his own country, married again, he caught 300 foxes and tying them together tail to tail, with a fire-brand between them, let them loose in the fields of the Philistines. His own countrymen bound and delivered him into the hands of his enemies, but he snapped the cords asunder and killed 1,000 Philistines with the jaw-bone of an ass. From this period Samson was judge of Israel for 20 years. While on a visit to Gaza the gates of the city were closed upon him by the Philistines, whose intention it was to kill him, but he rose and carried off the gates to a distance of 20 or 30 miles. Not long after he fell in love with Delilah, to whom he revealed the secret of his strength, and she by cutting off his hair deprived him of his powers and betrayed him to his enemies, who put out his eyes and set him to work in a mill with slaves. At a great festival in honor of Dagon Samson was brought out to furnish sport to the Philistines. But his hair had grown again, and his vigor having returned with it, he took vengeance on his enemies by pulling down over their heads the building in which they were assembled. Milton has made his death the subject of a drama — 'Samson Agonistes' (1671), Handel that of an oratorio, 'Samson' (1743) — and his exploits have been illustrated in the woodcuts of Dürer, and the paintings of Guido Reni, Rembrandt and Rubens.

SAMSON AGONISTES, a tragedy in blank verse and irregular meters, the final work of the English poet, John Milton, was published in 1671. In substance the drama is based on the story of Samson in Judges xiii-xvi; in form it follows rigorously the model of classical tragedy.

The action is limited to the final episode of Samson's life, his destruction of himself and great numbers of the Philistines by pulling down the pillars of their theatre, at a public festival to which he had been brought as a captive to entertain the populace. Preparation for the catastrophe is made by a series of events, comprised in a single day, which rouse Samson to make final use, for the glory of the

Hebrew God, of the power which had been entrusted to him and which through his own sin he had temporarily lost. A chorus of Hebrews reviews the events of Samson's life and interprets the changing emotions of the action.

The intensity of feeling which Milton has put into his picture of Samson is due to the analogy which he felt between the lot of his hero, a chosen champion of God, "blind amid enemies," and his own position in the alien society of the Restoration. Though lacking the poetic brilliancy and the variety of 'Paradise Lost,' 'Samson Agonistes,' by virtue of its moral and spiritual energy and its consummate art, makes a profound impression on the reader. More nearly than any other work in our literature it is the modern counterpart of The Book of Job. Consult the works on Milton listed under PARADISE LOST; also 'Samson Agonistes' (edited by Verity, A. W., 1892); and Jebb, R. C., 'Samson Agonistes and the Hellenic Drama.'

JAMES H. HANFORD.

SAMUEL, Hebrew judge and prophet about 1140 B.C., whose rule preceded the establishment of the kingly office. His name, in Hebrew "Shemuel," meaning "asked from," or "heard of God," is explained by his story as a child. He was the son of Elkanah, of Ramathaim-zophim, belonging to the tribe of Levi, by Hannah. Hannah had been barren previous to the birth of Samuel, but she prayed earnestly to the Lord for a man-child, and vowed that if her petition were granted she would consecrate the child to the Lord all his days. Her prayer being heard she took her son to Shiloh to surrender him to the high-priest to be trained to the service of the Lord. The boy grew up devoted to the temple service; but after the death of Eli nothing more is heard of Samuel for a space of about 20 years, while the Ark, restored by the Philistines, was in the house of Aminadab. He then exhorted the Israelites, when they were hard pressed by the Philistines, to abandon their idolatry, and to fear God and worship him, as their only means of deliverance. His prayers and sacrifices gained for them the victory at Mizpeh, and it is probable that from this time, and in consequence of the leading part Samuel then took, he obtained the name and authority of judge. It is recorded that he judged Israel all his life, going a yearly circuit from Ramah, where was his home, to Bethel, Gilgal and Mizpeh. At Ramah he built an altar to the Lord. His administration was distinguished by the restoration of the neglected worship of Jehovah. He also established schools of the prophets. In his old age the corruption of his sons, to whom he had transmitted the active duties of the office of judge, excited discontent among the Hebrews, who demanded a king. Samuel reluctantly yielded to this revolution, but at the same time anointed the king of the general choice. After the establishment of the monarchy Samuel still continued to be judge in matters affecting morals and religion, in addition to the exercise of his prophetic functions. In his bearing toward Saul Samuel conducted himself with wonderful dignity and kindness. He earnestly desired that Saul, as king, should rule well in the fear of the Lord, and that his dynasty should be permanent. When Saul attacked the priestly

office and privileges Samuel anointed a new king, David. He did not live to see the contest between David and Saul decided; but even after his death his spirit, evoked by the witch of Endor, threatened Saul with the divine vengeance. See SAMUEL, BOOKS OF.

SAMUEL, Books of. In the Hebrew Bible the two books of Samuel, like Kings, formed originally one book. The title is derived from the name of the prophet who appears as the principal character in the earlier part of the narrative and who played a most decisive part in the founding of the Hebrew monarchy.

The book seems to have been composed, in essentially its present form, shortly before the publication of the law of Deuteronomy in 621 B.C. After that event Samuel received some editorial revision and additions, but no such rigid framework, designed to teach the great lessons of Deuteronomy, as is seen in Judges and Kings. It thus belongs to the first great era of Hebrew historical writing, which began in the latter half of the 10th century B.C. and ended with the publication of Deuteronomy. The analysis of this book into its component documents has not been so satisfactorily worked out in detail as in the case of the narrative books of the Hexateuch, but there is no great difficulty in recognizing a general distinction between the older and younger elements, at least in the first part of the work. The earlier strand gives a vivid, natural account of the rise of the monarchy, with Samuel appearing as a local seer and leader of a religious-patriotic movement, eager to unite the Hebrew tribes in a struggle against their Philistine oppressors. In the later strand, Samuel figures as himself a recognized military leader and "Judge" of united Israel, who wins overwhelming victory in the struggle against Philistia and is at first opposed to the establishment of the kingship. The earlier picture shows the "king maker" as a really greater and nobler man than the later represents. From a relatively obscure position, with keen vision he recognizes in the unawakened giant who comes to consult him the possibilities of a king who shall unite and free the tribes, and he very skilfully sets in operation influences that make Saul's own action sure. In the later tradition, which took shape in Samuel's own tribe, the figure of the prophet has grown into that of one who holds a position of recognized leadership and authority, but it is no longer one who sees the real need of the time. Many scholars connect the earlier strand with the great Judean history that appears throughout the Hexateuch, and the later with the similar Ephraimite history. It seems more probable, however, that the later strand was written after the composition of the Ephraimite history, while the early stories of Samuel and Saul were composed before the Judean history of the Hexateuch. In the latter part of 1 Samuel and in 2 Samuel we do not have so clearly an inweaving of an earlier and later document, but it is possible to distinguish, to some extent, the younger and older elements. Recognition of the composite origin of the book relieves the obvious difficulty of the duplicate narratives that puzzle any attentive reader — the two introductions of David to Saul, the two origins of the saying con-

cerning Saul among the prophets, the two accounts of sparing Saul's life, etc. The analysis also brings into clear relief as a separate document the wonderful, dramatic story which, with some later elements, constitutes chaps. ix to xx of 2 Samuel.

The book as a whole attained substantially its present form earlier than any other of the historical books of Israel. In its completed form, it falls into five principal sections, due in part to the plan of the compiler and in part to the form in which the materials came to him: (1) Samuel and the establishment of the kingdom under Saul (1 Samuel i-xiv); (2) Saul and the rise of David (1 Samuel xv-xxxi); (3) the establishment of David as king (2 Samuel i-viii); (4) court and family life of David (2 Samuel ix-xx); (5) Appendix (2 Samuel xxi-xxiv). Some would treat (2) and (3) as one section—the summaries of the reigns of Saul and David introduced into 1 Samuel xiv and 2 Samuel viii would favor such division. In the opening chapters of the book the scenes lie in the days of the Judges, when the tribes of Israel are without political union or any common organization. The birth and boyhood of Samuel are recounted. The defeat of Israel by the Philistines with the capture, vicissitudes, and restoration of the Ark precede Samuel's judgeship and victory in battle against the Philistines. The circumstances leading to Saul's selection as king and his early victories are followed by the summary of his wars and a notice of his family. The second section opens with the rejection of Saul and the introduction of David to the history. It is occupied chiefly with Saul's growing jealousy and David's flight and outlaw life. Saul's last battle against the Philistines closes this section. The third division gives David's elegy over Saul and Jonathan, taken from a collection of national songs known as the Book of Jashar. The narrative goes on to record the steps by which David becomes king over all Israel, with the Philistines subdued and the Hebrew capital established at Jerusalem. The summary of David's victories and his court officers closes this section. The following division (2 Samuel ix-xx) tells the story of the birth of Solomon and the troubles in David's family that resulted in the deaths of older brothers, making room for Solomon's ascent to the throne. The conclusion of this dramatic narrative is not given in the book of Samuel, but forms the introduction of the book of Kings. The appendix contains two songs ascribed to David, one of which occurs also as the 18th Psalm, lists of David's heroes, and two very primitive stories of a famine and pestilence that occurred during his reign. Samuel thus contains a history of the transformation of a group of tribes into an organized state, commanding the respect of neighboring kingdoms and able to weather the storms of rebellion and civil war.

Viewing the book as literature, the early narrative of Saul's selection, beginning with chap. ix, the stories of his jealous struggle against the rising prestige of David, and the complex story of David's court and family life are to be noted as the earliest examples of connected prose in ancient Israel. As such they constitute the beginnings of genuine his-

torical literature in the writings of the world. From these vivid narratives, committed to writing soon after the events had occurred, the writers of Judah and Israel later went on to compose the story of the earlier past. In power to select the significant points that make character and event living and intelligible, these early narratives are unexcelled in prose literature. The religious and moral conditions recorded show many primitive traits, yet the narratives are characterized by a devotion to the God of justice, who cares for right conduct among men, that makes them perennial sources of moral and religious inspiration.

HENRY THATCHER FOWLER,
Professor of Biblical Literature and History,
Brown University.

SAMURAI, the feudal warriors of Japan, who, prior to the revolution of 1867-68, comprised about one sixteenth of the population (see JAPAN) and are now represented by the *shizoku*, or knights. They were distinguished by indomitable courage, their marvelous feats of arms, fervent patriotism, intense loyalty and a strong antipathy to foreigners, which was in marked contrast to the hospitable and courteous demeanor of the mass of the population. They were the military retainers of some 276 daimios or feudal chieftains, the more powerful among whom were those of the southern clans Satsuma, Choshu, Tosa and Hizen. After the reopening of foreign relations due to United States initiative in 1854, the enlightened Japanese discovered at once that to place themselves commercially and politically on a level with the progressive nations of the world they had to adopt Occidental methods and the prominent chiefs and their samurai were the first to advocate the suppression of the Tokugawa shogun, the supremacy of the mikado, the surrender of feudal powers, and a reorganized administration for the building up of a constitutional monarchy, most of which was effected by the revolution of 1868.

The samurai expected that the military and naval services would be exclusively reserved for them and their descendants. The radical measures adopted in 1871, however, led to the total abolition of feudalism and the absorption of the samurai into the mass of the people, in many cases with a praiseworthy self-abnegation, but in others not without serious opposition. That of the famous Saigo of Satsuma, hitherto one of the most prominent reformers, culminated in the civil war of 1877 and the total defeat of the samurai and their pretensions. See JAPAN.

SAMVAT, a method of reckoning time in India, generally used except in Bengal. Chris-

tian dates are reduced to Samvat by adding 57 to the Christian year. See CALENDAR.

SAN ANDRES, *sān ān'drās*, or **PICO DE ORIZABA**, Mexico, an extinct volcano, called by the Aztecs Citlalepetl, or Mountain of the Stars, $6\frac{1}{2}$ miles southeast of the city of Orizaba. It is 5,550 metres high and the loftiest mountain of Central America. Its highest pass, Cuchilla, has an elevation of 4,418 metres, snowline of 4,292 metres; the deepest glacier, El Corte, 4,015 metres. It was first ascended in 1848, by two American officers, Reynolds and Maynard. Its last eruption extended from 1545-66.

SAN ANGELO, *an'jēl-ō*, Texas, town, county-seat of Tom Green County, on the Concho River and on the Gulf, Colorado and Santa Fé Railroad, 180 miles northwest of Austin. It is the centre of a prosperous stock-raising and wool-growing region; agriculture is also carried on successfully in the vicinity; fruit and celery being important products. The town contains flour mills and an ice factory. In 1918 there were four national banks with combined capital of \$625,000 and resources of \$4,670,410 and the assessed property valuation exceeded \$6,000,000. It has an elevation above sea-level of 2,000 feet and is a health resort, especially for consumptives. There is a public high school established in 1889. Pop. 10,321.

SAN ANTONIO, Texas, city, county-seat of Bexar County and the largest city in the State, is on the San Antonio River, 150 miles from the Gulf Coast and about the same distance from the Rio Grande border at Laredo. This quaint and picturesque old city of Spanish origin is beautifully laid out on a plateau 661 feet above the sea-level, along both banks of the San Antonio, a few miles from where it bursts forth—at once a river of volume and great natural beauty—from hundreds of crystal springs, in a noble woodland park. Through the western part of the city runs a smaller stream flowing out of another group of sparkling waters, situated in a live-oak grove, known as San Pedro Springs.

Railroads.—The Southern Pacific, International and Great Northern, Missouri, Kansas and Texas, San Antonio and Aransas Pass and San Antonio and Gulf railroads pass through the city and the extension of the Frisco main line makes it a great railroad centre, from which four distinct lines penetrate into Mexico.

Waterworks and Sewer System.—The San Antonio Water Works Company, a private corporation, maintains a thoroughly modern system of water supply. The water is obtained from 17 large artesian wells, furnishing a daily supply of 50,000,000 gallons of wholesome water. The company also owns riparian rights around the head springs of the San Antonio River and has a large reservoir adjacent on a hill, kept fully supplied for any emergency. In addition many of the office buildings, hotels and manufacturing plants have their own wells yielding an additional 45,000,000 gallons daily. The sewer system, constructed after the most approved engineering science, meets the latest sanitary requirements.

Street Railway and Lighting.—The traction company has 96 miles of well-built elec-

tric lines furnishing modern equipment and excellent service to an annual average of 32,000,000 passengers carried. There is also maintained a complete plant for gas and electric lighting and power, with all the necessary mains and supply lines.

Parks and Plazas.—There are 26 cultivated parks and plazas in the city comprising 423 acres and valued at more than \$2,000,000 under the management of a park commissioner. The city is renowned for the beauty of its natural parks and the attractive features of its old Spanish plazas. Brackenridge Park, situated adjacent to the head springs of the San Antonio River, is a noble forest of 230 acres, left in its natural state of oak, pecan and shrub growth and containing miles of well-kept walks and drives. In this park there is maintained a rare collection of buffalo, deer, antelope, elk and other wild animals. Through it flows the San Antonio River which furnishes the site of the Lambert Bathing Beach, one of the most popular resorts of its kind in the country. San Pedro Springs is another favorite resort, with lakes, shady groves and an excellent "zoo." Seventeen iron bridges span the serpentine windings of the river in its 13 miles' course through the city, giving picturesque views at many points.

Many of the quaint characteristics of the old Spanish *régime* are still to be found in the public plazas, fragrant with their tropical trees and plants and famous for their Mexican chile and tamale stands and in the narrow streets in the old parts of the city, still called by their liquid Spanish names. The San Antonio Club, country fishing and hunting associations, golf links and tennis grounds afford recreation for the society world; the military reviews and artillery drills of the large garrison at Fort Sam Houston and during the late war Camp Travis, Camp Stanley, Kelly Aviation Fields and Balloon School draw crowds of visitors; and the annual spring carnival and battle of flowers on San Jacinto day have made San Antonio as noted as the Mardi-Gras spectacles have New Orleans.

Public Buildings.—Among the public buildings are the courthouse, the Federal building, the market house and convention hall, with a seating capacity of 4,000; the city hall, the Grand opera house, the San Fernando cathedral, part of which was built in 1749; the Saint Mark's Cathedral, the city and county hospital, the many fine hotels, whose open courts are filled with tropical plants, palms and flowers; several theatres and numerous stately and ornamental business blocks.

Commerce, Banking and Manufactures.—The unique situation of San Antonio, 200 miles from any rival business centre, has given it a commanding position as to the trade of a large section of Texas and Mexico. Large wholesale houses push their business through an extensive territory. The city possesses about 269 manufacturing establishments, including several machine shops and foundries, flouring mills, binderies, cotton presses, cement works, broom factories, oil mills, etc., and their products are distributed through a vast section. There are 24 banks: National, State and private. Their combined capital is more than \$8,000,000; their deposits average about \$40,000,-

SAN ANTONIO, TEXAS

1 Court House and Main Plaza

2 City Hall — Military Plaza

000; their cash on hand averages about \$16,000,000 and their loans over \$36,000,000. The manufacturing establishments employ 7,000 people, are capitalized at \$18,000,000 and produce merchandise to the value of \$30,712,876. The city is a prominent cotton market and is the financial centre of the most extensive stock interests in the Southwest. San Antonio is surrounded by many acres of irrigable farms, with water supplied by numerous artesian wells obtained at an average depth of about 1,200 feet. Truck gardening is here conducted on an extensive scale, largely by Belgian gardeners, and the products are shipped to the northern markets, where they are months ahead of similar products from other sections.

Churches and Education.—San Antonio has two beautiful cathedrals and 79 churches of the leading denominations. The public schools are under the control of a school board elected by the people. There are 34 public elementary and three high school buildings, valued at \$3,000,000. The total annual enrolment of pupils is 25,000. There are also located in the city and its suburbs 36 private schools and colleges, making it one of the most important educational centres in the South. These private institutions contain several thousand pupils. The Carnegie Library, established through the liberality of Andrew Carnegie, occupies a building constructed at an expense of \$50,000 on a site valued at \$15,000. It is under the control of a board of trustees; has endowment funds of \$10,000 invested, the income of which, together with a special tax of some \$5,700 annually levied under a special provision of the city charter, maintains its work.

Government.—The administration of municipal affairs is under the commission form of government. The mayor is the chief executive officer, assisted by four commissioners. An excellent paid fire department and a thoroughly efficient uniformed police force are maintained. The assessed valuation of property in the city for taxable purposes is \$130,368,660. The total tax rate for city and school purposes, \$2.15. The Somers system of realty equalization became operative 1 June 1914. Under the State organization there are held in San Antonio three district courts, one of them with criminal jurisdiction, a court of civil appeals of three judges, a county court with probate jurisdiction and two justices of the peace courts, and under the Federal Jurisdiction District and Circuit courts.

Suburban Attractions.—There are several attractive suburban additions, not strictly included within the city limits, such as West End, Alamo Heights and the Hot Sulphur Wells. These are all noted for their handsome improvements and beautiful surroundings. The Sulphur Wells Company has an elaborate bathing pavilion where medicinal, Turkish and vapor baths are given, with all the usual massage accompaniments, and a modern, well-conducted hotel for its patrons. There are also in close proximity to the city other medicinal, hot sulphur and chalybeate artesian wells, notably the Terrell and Dullnig properties, whose remarkable curative qualities are well established. Corpus Christi, Rockport and Aransas Pass for sea fishing and duck hunting, Lake Medina and Mitchell Lake, Laredo, where excursions may be made into old Mexico, are all within easy access.

Climate.—The altitude of the city is 661 feet above the sea-level at the main plaza; at Fort Sam Houston on the government hill it is 768 feet. The average annual temperature is 68°; mean maximum in summer, 79°; mean minimum in winter, 57°. The air is dry, bracing and aseptic, the average relative humidity being 67°. The summer heat is tempered by a strong current of air which blows for nearly eight months almost constantly from the Gulf, making the summer nights delightful. The winter climate most of the time resembles, in its salubrity and temperature, that of Cairo, Sorrento, or the Riviera, varied at times by a norther, which stimulates like a tonic. The attractions of the climate, the wealth, refinement and hospitality of its cosmopolitan people, its quaint and artistic beauty and its interesting historical associations and landmarks make San Antonio one of the most charming, picturesque and notable cities in the Union.

History.—The first Spanish settlement at San Antonio grew out of the fierce rivalry between Spain and France for the possession of Texas. There were probably temporary military encampments made on the site of the present city by the exploring expeditions of Alonzo de Leon and Domingo Teran, in the latter part of the 17th century; but the real beginning of the city dates from 1716, when the presidio (garrison) of San Antonio de Bejar (or Bexar, pronounced Bá-y-har) was established on the San Pedro Creek, within the present city limits, by Don Domingo Ramon.

Two years later followed the Franciscan mission of San Antonio de Valero, and in 1722 both the presidio and mission are found firmly settled on the Plaza de las Armas, now the military plaza of the modern city. In 1730, under a royal decree issued with a view of colonizing the new military and religious settlement, 15 families were brought from the Canary Islands, the head of each raised to the dignity of a hidalgo, and all located adjacent to the presidio, where, around what was then called the Plaza de las Yslas and now constitutes the main plaza, they proceeded to establish the pueblo (or villa) of San Fernando de Bejar. The mission of San Antonio de Valero was afterward, in 1744, removed half a mile farther east to the site still occupied by the historic chapel of that mission, known as the Alamo, and forever hallowed as the scene of the desperate and tragic struggle of 6 March 1836. From these various names of the presidio, mission and pueblo, respectively, there has been evolved by some gradual blending process the modern name of San Antonio de Bexar, the affixed name having, under the State organization, been finally given to the county.

While Texas was a Spanish and Mexican province, San Antonio, called indiscriminately in those days San Antonio and Bejar, was most of the time the capital and always an important military station. During the long war of the revolution of Mexico against Spain, the old city witnessed many scenes of fierce strife and cruel bloodshed. Revolutionists and royalists engaged in bitter contests for the possession of the city, amidst scenes of unparalleled atrocity. In 1811 the head of Nicolas Delgado, a prominent adherent of the revolutionary party, was stuck upon a pole on the main street, after his cruel execution by order of the Spanish governor, Salcedo. On 29 March 1813, the battle of the Rosillo was fought a few miles from the city,

in which the royalist army, under Governor Salcedo, was defeated, with the loss of 1,000 men, by Mexican revolutionists and American adventurers under Gutierrez and Kemper. San Antonio at once fell, and a junta of revolutionary chiefs ordered butchered immediately in cold blood, in revenge for the execution of Delgado, the governor, Manuel de Salcedo, Governor Herrera of New Leon and 15 other Spanish officers who had surrendered. On 4 June 1813, General Elisondo with a royalist force of 1,500 was defeated on the heights of the Alazan, one mile west of the city, after a desperate battle, by the revolutionists and Americans under Gutierrez and Colonel Perry.

The famous Spanish general, the Marquis of Arredondo, now marched on San Antonio with a new army of 2,000 men, and 18 Aug. 1813, met the Republican forces commanded by Toledo and Perry, near San Antonio, on the Medina, and, after a furious contest, defeated them amidst frightful carnage. Arredondo immediately entered the city with his triumphant army, and proceeded to make the most cruel exactions and bloody reprisals upon the patriot population. Private property was confiscated; 600 citizens were crowded into narrow and unwholesome prisons, where many died through suffocation; others were at once shot, including all the male members of the Delgado family, not sparing even a boy of nine years; hundreds of women of the best families were imprisoned in the Quinta and compelled to grind corn for Arredondo's army. These bitter contests and periodical revolutions nearly ruined the city; and it was not until the independence of Mexico was finally won in 1821 that its prosperity began to revive. By 1823 its population had increased to nearly 5,000.

In 1835 the revolution of Texas against the dictatorial government of Santa Anna (pronounced Sant' Anna) broke out. A Texan force of 800 men under Burleson and Milam advanced upon the city, then under the command of General Cos, with an army of 1,400 men, and, after a siege of a month, the city was gallantly stormed by the Texans, losing in the assault their courageous leader, Ben Milam. On 10 Dec. 1835 Cos surrendered his entire command, with 21 pieces of artillery, and large stores of ammunition and supplies. During the succeeding winter the city was held by a small force of Texans under the command of Wm. Barret Travis, assisted by such heroic spirits as the renowned frontiersman, Davy Crockett of Tennessee, James Bowie, who had lived several years in San Antonio and had married there Governor Veramendi's daughter, and the chivalrous Colonel Bonham of South Carolina. The dictator, Santa Anna, in February 1836, completed his vast preparations for retaking San Antonio and marched from Monclova with a force of nearly 6,000 men, the *élite* of the Mexican army. Learning of his near approach, Travis, with 145 men, subsequently increased by volunteers to a total of 179 men, retired from the presidio on the military plaza and established his little command in the abandoned mission-fortress of the Alamo. Santa Anna took possession of Bejar 23 Feb. 1836, and rapidly completed the investment of the Alamo, surrounding the mission on all sides. He had three brigades of infantry under Generals Sesma, Tolsa and Gaona, a cavalry command under An-

drade, and ample siege artillery directed by General Ampudia. The hardy Texans had not only their deadly rifles to depend upon, but also 14 pieces of artillery which had been mounted by their Mexican predecessors on the church itself and on the walls surrounding the rectangular court of the mission. These walls have long since disappeared, but the site of this court is the northern part of the present Alamo plaza. Here, then, for 10 days, took place the most memorable, thrilling, tragic and sanguinary siege in American history; 179 indomitable American frontier riflemen against an army of 6,000 brave and disciplined troops, led by veteran officers. After many desperate assaults and bloody repulses, on 6 March 1836, four storming columns of 2,500 picked troops, led by Cos, Duque, Romero and Morales, amidst death-dealing volleys and horrible carnage from the murderous rifles and artillery of the Texans, finally succeeded in scaling the walls. The heroic defenders fought desperately hand to hand, from wall to courtyard and courtyard to buildings, until the last man perished, there being no survivors of the dreadful massacre but two women, two children and two servants. Santa Anna's total losses in this desperate siege were estimated by Alcalde Ruiz, who superintended the burial of the dead, at 1,600, of which over 600 were killed or died of wounds.

It was on this sacred spot, thus baptized by the blood of heroes, that San Antonio elected to receive President McKinley on the occasion of his visit in 1901, and there to tender the Chief Magistrate of the country the enthusiastic welcome of its people. In 1840, 65 Comanche Indians came into the city to enter into negotiations with Texas commissioners for a treaty of peace. A row broke out in the council house over the surrender of white prisoners; fierce fighting began in the building and continued into the plaza and streets until 32 Indian warriors were killed and all the rest of the party captured. Seven Texans were killed and eight wounded in this bloody contest. In the fall of 1840, 18 dead bodies were brought in from the edge of town and laid out in the courthouse. Nineteen young men had gone out riding for pleasure and had been surprised by a sudden attack of Indians and all had been killed but one, and their bodies left stripped and horribly mutilated.

Mexico still kept up hostilities against the new republic, and 11 Sept. 1842 a Mexican army of 1,300 men under General Adrian Woll surprised the city and captured it, making prisoners of 52 of the most prominent citizens, including the venerable judge of the District Court and the entire bar of lawyers. They were driven on foot in front of mounted guards, a cruel and toilsome march of over 1,000 miles, and imprisoned at hard labor, chained together in couples, for nearly two years in the castle of Perote, in the state of Vera Cruz. Woll, who had remained in San Antonio with his main army, was badly defeated a few days later by Colonels Hays and Caldwell and 220 Texans, in a desperate battle on the banks of the Salado, five miles east of the city, and was obliged to beat a hasty retreat into Mexico.

Military Post.—From the close of the Mexican War to the present time—save during the Civil War—San Antonio has been a military station for troops and generally also the head-

SAN DIEGO, CAL.

U. S. Grant Hotel and Office Buildings in the centre of business district, with the famous palm-bordered plaza

quarters of the army in Texas. The present military post of Fort Sam Houston and headquarters department of Texas, located on a commanding site in the northeast part of the city, occupying some 640 acres, is one of the largest in the United States, and its construction has cost upward of \$5,500,000. It has normally in garrison from 3,000 to 5,000 soldiers. A United States arsenal for storage of ordnance supplies and the manufacturing and repairing of equipment is situated in the southwestern part of the city. Also part of the military establishment are: Camp Travis, one of the national army cantonments, covering 4,000 acres, erected to meet war needs at a cost of \$6,000,000, which had in garrison normally about 50,000 troops; Camp Stanley, a great training and manœuvre field of 33,000 acres with a permanent encampment of 5,000 men; the Aeronautical Training School and the great Kelly Fields where 20,000 aviators were training in 1918.

Population.—The city has shown a marvelous development since the Civil War. Its growth, by the Federal census, has been as follows: (1870) 12,266; (1880) 20,255; (1890) 37,673; (1900) 53,321; (1910) 96,614. The city directory (1919) gives a population of 175,000. The winter population including tourists reaches 235,600.

Bibliography.—Corner, W., 'San Antonio de Bexar' (San Antonio 1890); Bancroft's account of the Storming of Alamo and other references to San Antonio; 'Fall of Alamo' (pamphlet); 'Memoir of Mary A. Maverick,' one of the first white women to live in San Antonio; Spanish documents and reports in Bexar archives, touching Arredondo's victory and operations and various points in early history.

SAN ANTONIO, a river in Texas, which has its rise in Bexar County, formed by the confluence of the Medina River and Leon Creek. It flows east through three counties, a distance of about 200 miles and enters Espiritu Santo Bay, an inlet of the Gulf of Mexico.

SAN BERNARDINO, sän bër-när-dē'nō, Cal., city, county-seat of San Bernardino County, on the Southern Pacific and the Santa Fé railroads, about 70 miles from the Pacific Coast, where the transcontinental railroads break through the mountains. Many electric lines connect the city. It was settled in 1851 by Mormons; was incorporated as a town in 1868 and chartered as a city in 1886. It is west of Mount San Bernardino, in a rich agricultural and mining region, where fruit grows in abundance. The chief industrial establishments are the Santa Fé railroad shops, lumber mills, grain elevators and factories in which are made crates for the shipment of fruit. There are about 1,400 men working in the railroad shops and on the trains. In 1914 there were 54 industrial plants, employing a combined capital of \$1,392,209, and yielding products valued at \$2,612,669. The city makes extensive shipments of fruit, grain and lumber. San Bernardino is a famous health resort both summer and winter, on account of the equable climate, the beautiful scenery and the variety and abundance of fruit. The principal public buildings are the courthouse, the hall of records, the hotels, the seven churches, the Southern California State Hospital for Insane and an orphan asylum.

In 1918 there were three national banks with combined capital of \$300,000 and resources of \$3,409,112. The educational institutions are Saint Bernardine of Sienna Academy, a high school, public and parish schools and a private business college. The government is vested in a board of trustees elected every four years. Pop. 12,779.

SAN BERNARDINO, (1) a range of mountains in the southwestern part of California; an extension of the Coast Range. (2) A mountain peak of the San Bernardino Range; the highest mountain of the Coast Range and the peak which has given name to the group of mountains to which it belongs. The height is 11,604 feet.

SAN BERNARDINO, a strait of the Philippines between the extreme southeastern point of Luzon and northwestern Samar, connecting the Pacific Ocean with the Visayan Sea. It is of commercial importance as forming the eastern end of the Verde Passage between the United States and Manila.

SAN BLAS, bläs, Mex., in the territory of Tepic, situated on the Pacific Coast southeast of the mouth of the Rio Grande de Santiago. It is the terminus of the Mexico-Guadalupe Railway, and an important port. The industries are ship-building, lumbering and agriculture. In the vicinity are considerable gold, silver, copper and lead mining interests. Pop. 3,500.

SAN CARLOS, kār'lōs, Chile, town in the province of Nuble, in the northern part of the state, on the main railway of Chile, 15 miles northeast of Chillan. Pop. 9,300.

SAN CARLOS, Philippines, pueblo, province of Pangasinán, Luzon, on a tributary of the Agno River, 10 miles southeast of Lingayén. It is the centre of four main highways and near the Manila and Dagupan Railroad. Pop. 27,166.

SAN CARLOS, Order of. See ORDERS, ROYAL.

SAN CRISTOBAL DE LOS LLANOS, krēs-tō'bāl də lōs lā'nōs, or **CIUDAD DE LAS CASAS** (City of Las Casas), Mexico, largest city of the state of Chiapas, lies northeast of the capital, Tuxtla-Gutierrez. It occupies a high (1,981 metres), fertile and beautiful valley on the eastern slope of the central mountain range. It is the see of an archbishop and has a cathedral, several convents, seminario conciliar, or university, a grammar school and a hospital, and a handsome capitol. It has an active trade, especially in coffee; it also has manufactures of earthenware and coarse textiles. The chief occupation, however, is the raising of cattle, horses, mules and swine. The town was founded in 1528 on the site of the ancient Zacatlan, and named in honor of the celebrated priest Las Casas. Pop. 18,700.

SAN DIEGO, de-ágō, Cal., city, port of entry and county-seat of San Diego County, on San Diego Bay, and on the Atchison, Topeka and Santa Fé and the San Diego and Arizona railroads, about 125 miles south of Los Angeles. San Diego Bay, landlocked and safe at all seasons, has an area of 22 square miles, with 39 feet water, low water, over bar. It is one

of the world's 10 great harbors. The city spent \$1,400,000 recently for a municipal pier. In 1915 the Panama-California Exposition was held here, and in 1916 the Panama-California International Exposition. The climate is remarkable, equable and salubrious; the average varies but 8° between summer and winter, and but 2° from day to day. The community produces a large amount of fruit, honey, poultry, grain and cattle. There are 200 manufacturing concerns established, the largest being the Hercules Powder Company (potash plant), Swift and Company (potash), Savage Tire Company, Magnesite company, fish canneries, etc. The principal buildings are the Federal building, library, State normal school, high school and stadium, Spreckels building, Union building, Watts building and the American National Bank building. The school system has no superior, considering the population of the city. There are also a number of private schools of splendid merit. San Diego has many fine church edifices; a number of theatres, one costing \$1,000,000; hotels and apartments, one hotel costing \$1,500,000, another \$2,000,000. The bay was discovered in 1542, the San Diego Mission founded by Father Serra in 1769 and the city laid out in 1867. The principal points of interest are Balboa Park, Mission Cliff Gardens, Old Town, Point Loma (one of the three greatest views of the world), La Jolla Caves, Sunset Cliffs, Coronado Hotel and beach, Fort Rosecrans and a wireless station. Pop. 92,499. Consult Gunn, 'San Diego: Climate, Productions, Resources, Topography' (San Diego 1887); Smythe, W. E., 'History of San Diego' (ib. 1907).

SAN DOMINGO, sãn dô-mêng'gō. See SANTO DOMINGO.

SAN DOMINGO INDIANS, a Pueblo tribe of New Mexico. See QUERES.

SAN FELIPE, fã-lê'pã, Chile, an agricultural town and capital of the province of Aconcagua, 40 miles north of Valparaiso, with which it has railway connection, in the fertile valley of Aconcagua. It is an interesting regularly built town, with an attractive central square and highly improved boulevards. Pop. 13,000.

SAN FELIPÉ INDIANS, a Pueblo tribe of New Mexico. See QUERES.

SAN FERNANDO, fěr-nãn'dō, Chile, town, capital of the province of Colchagua, and a railway junction, 80 miles south of Santiago. Pop. about 8,500.

SAN FERNANDO, Philippines, (1) Pueblo, province of Cebú, on the east coast, 16 miles southwest of Cebú, the provincial capital; pop. 18,200. (2) Pueblo, province of Pampanga, Luzon, on the Manila and Dagupan Railroad, five miles northeast of Bacolor. It is the railroad shipping point for Bacolor, with which it is connected by highway, and is an important centre of the sugar industry, containing sugar mills and warehouses. It also has an extensive wholesale and retail trade in groceries and drugs; pop. 13,270. (3) Pueblo, capital of the province of Unión, Luzon, on San Fernando Bay, 45 miles north of Dagupan. It is on the coast highway and also on the projected route for the continuation of the Manila

and Dagupan Railroad. It has also frequent communication with Manila by sea. Fishing is an important industry; pop. 13,270. There are three smaller pueblos of the same name: (a) pueblo, province Ambos Camarines, Luzon, a road centre with good trade; pop. 3,270; (b) pueblo, Ticao Island, province of Masbate, also known as Butúan; pop. 2,367; (c) pueblo, province of Zambales, Luzon, on Bancal Valley highway; pop. 453.

SAN FERNANDO, Spain, on the Isla de Leon, seven miles southeast of Cadiz, in the province of Cadiz, is a fortified town built in modern style. It has two churches, two hospitals, a naval academy and workshops, an extensive arsenal, a fine observatory (the southernmost of Europe) and an iron foundry. It has numerous domestic industries and a brisk trade in salt. Pop. about 30,000.

SAN FRANCISCO, sãn frãn-sis'kō, Cal., metropolis of the Pacific Coast and the largest city in the United States west of the Mississippi River, ranking 11th in the whole country and second only to New York in commercial importance, is situated on a hilly peninsula 40 miles long between the Bay of San Francisco and the Pacific Ocean, in 37° 47' 22" N. lat. and 122° 25' 40.76" W. long. San Francisco Bay, the only commodious harbor on the Pacific Coast south of Puget Sound or north of San Diego Bay, is entered through Golden Gate Strait, about three miles long and nowhere less than a mile in width, north of the city. The bay is about 90 miles long (50 miles in medial line) and from 5 to 15 miles wide. It has an area of 450 square miles and a shore line of over 300 miles. It is completely sheltered from the sea gales by the low hills of the peninsula and forms the biggest land-locked harbor in the world, affording excellent anchorage ground regardless of tides. It is supplied with drydocks and every facility for the care of vessels. The city is connected with regular lines of steamships: (1) with all ports on the Pacific Coast of North and South America, the distances in nautical miles to the principal points in the north being Portland, Ore., 653; Seattle, Wash., 804; Vancouver, British Columbia, 833; Juneau, Alaska, 1,608; Sitka, Alaska, 1,784; the distances to the principal ports to the south being San Pedro, port for Los Angeles, 393; San Diego, Cal., 482; Mazatlan, Mexico, 1,478; Acapulco, 1,836; Guaymas, 1,954; Panama, 3,277; Valparaiso, 5,140; (2) with the Atlantic seaports via the Panama Canal, the distances being to New York, 5,262; Liverpool, 7,836; (3) with Hawaii, Japan, China, Siberia, the Philippines, distances being Hawaii, 2,100; Honolulu, 2,100; Yokohama, 4,545; Shanghai, 5,387; Hongkong, 6,049; Vladivostok, 4,570; Manila, 6,221; (4) with Samoa, New Zealand and Australia, the distances being Apia, 4,200; Auckland, 5,930; Sydney, 7,210. The city is also connected by rail with all points north and south on the Pacific Coast and all points in the Middle West and east of the United States, the distances being by shortest mail route: to Seattle, 808 miles; to Los Angeles, 482 miles; New Orleans, 2,490 miles; to Chicago, 2,357 miles; to New York, 3,269 miles. Nearly in front of the city are three important islands, Alcatraz (fortified), Angel Island (fortified) and Yerba Buena or Goat Island.

General Description.—The city, which was originally built on the shore of the bay and on the steep hills rising from it, has gradually extended across the peninsula (here six miles wide) to the ocean. On the north it is bounded by the Golden Gate. The city of San Francisco includes within its municipal territory $46\frac{1}{2}$ square miles, covering a tract of land which is almost square in shape, about seven miles long and seven wide. Many of the streets, especially in the northern and western sections of the city, are very steep, which would have presented an insurmountable obstacle to ordinary street railway traffic, but this problem was simply solved by the cable car system, invented by A. S. Hallidie, whereby the cars are drawn along the tracks by an underground wire cable. Only 25 years ago the western section of the peninsula was an arid waste of shifting sand dunes, continually being augmented by the sands being blown up from the sea beach by the strong sea breezes, but this district has since been entirely built over and the well-paved streets now stretch from the shores of the bay over to the sea shore. In the early days there was a deep dent in the inner, or bay shore of the peninsula. This was filled in and is now the heart of the wholesale business section of the city. The site of the recent Panama-Pacific Exposition was, only a few years ago, a salt meadow marsh which has also been filled in.

The streets are unusually broad and are well paved. The main thoroughfare is Market street, 120 feet wide, which cuts the city diagonally from the water front in a southwesterly direction. The district south of Market street is flat and constitutes the manufacturing section and the homes of the wage-earning classes. But farther to the westward and southward lies the old Mission District, largely a better-class residential section. To the north of Market street lie the steep thoroughfares along which are built the big office buildings and the shops of the better sort and, farther west, the homes of the more prosperous classes and the wealthy capitalists. In the lower part of this section near the water front and within the business district is Chinatown, which has always been one of the picturesque features of the city. Slightly north of Chinatown rise the bald bluffs of Telegraph Hill, whose signal station announced the approach of incoming ships in the early days. Below Telegraph Hill lies the Latin Quarter, where live the few surviving families of the old Spanish population.

Parks.—In 1918 San Francisco had 32 public parks and squares, covering 1,399 acres, or nearly one-twentieth the total area. The chief public park is Golden Gate Park, comprising 1,013 acres of rolling and hilly land reclaimed from the sand dunes. Of about the same shape as Central Park in New York City, it begins almost in the centre of the city and stretches westward over to the shore of the Pacific. Besides its vast lawns and well-graded driveways and boulevards, it includes among its features nine baseball diamonds, a dozen tennis courts, a well-equipped children's playground, a zoological park, a Japanese tea garden, a chain of lakes, an aviary, a botanical garden richly stocked with tropical plants and a 30-acre stadium. Within the past few years the city has spent much money on extending its system

of boulevards and driveways, the most notable of these later improvements being the great driveway running along the ocean beach for three miles. At the upper end of this driveway, just below the mouth of Golden Gate Strait, is the famous Cliff House, built on the brow of a cliff overlooking a number of rocky islands out beyond the surf line, on which hundreds of sea lions bask and romp in the sun. Just below the Cliff House and also on the beach is the bathing establishment, one of the biggest in the world, known as Sutro Baths, to whose concrete tanks the water is admitted directly from the ocean. The baths are 250 feet wide and 500 feet long and hold 1,805,000 gallons of water. The Presidio, farther back and on the shore of the strait, is another public park reservation, embracing 1,500 acres, including the barracks and parade grounds of the troops of the Department of California. A magnificent new boulevard extends to the summit of Twin Peaks, where a splendid view of the city can be had.

Climate.—The climate of San Francisco is very equable, a snowfall being so rare as to cause considerable excitement among the people, while frost may appear for only a few nights during the winter. The lowest temperature on record was 29 degrees, while the average temperature for the summer months is 70 degrees, though occasionally it rises to 100 degrees. The mean annual temperature is about 55 degrees. Rain falls only in the winter months, the average rainfall being about 28 inches. During the summer months the southwest trade winds prevail, forming a rather unpleasant feature in that in the afternoons they often attain an almost violent force and sweep the streets with stinging clouds of dust and sand. Fogs, too, are very frequent, especially in the mornings, sweeping in from the sea. In regard to these two disagreeable features the climate of San Francisco differs markedly from the climate of the suburban towns across the bay, Oakland, Alameda and Berkeley, whence large numbers of business men and the more prosperous class of wage-earners commute daily into the city.

Municipal Government and Public Service.—San Francisco has a combined city and county government, based on a charter which went into effect 1 Jan. 1900. Legislative power is vested in the board of supervisors whose 18 members are elected at large. The mayor is elected for a four-year term and he has the power to veto any item in the budget, a five-sixths vote of the board of supervisors being required to override his veto. He appoints the three members of the board of public works, the four police commissioners, the three civil service commissioners, the five members of the board of health, the four members of the board of education, the four fire commissioners, the five election commissioners and the five park commissioners and, within certain limitations, he may remove his own appointees. Appointments to the public service are made under strict civil service rules. The auditor, treasurer, assessor, tax collector, coroner, recorder and the county clerk are elected by the people. The waterworks and the gas and electric lighting systems are in the hands of private corporations, but part of the street railways are owned by the city, San Francisco being the first large

city in the United States to establish a system of municipal street railways. The Twin Peaks Tunnel, a subway system built by the municipality, will accommodate 100,000 passengers daily and contains a double-track railway 12,000 feet long. A municipally-owned waterworks is also contemplated for the near future. Under an Act of Congress, approved 13 Dec. 1913, the city was granted the rights to a watershed of 420,000 acres in the Yosemite Valley, the famous Hetch Hetchy grant. In 1919 the city had already spent nearly \$10,000,000 on this work. It is planned to secure a flow of 400,000,000 gallons of water a day. Before the great fire, in 1906, San Francisco had practically no debt, but by 1 Jan. 1919 the net bonded debt amounted to \$44,476,100. There are 97 public schools and an enrolment of 70,800 pupils. There are also two richly endowed technical schools, while the departments of law, medicine, dentistry, pharmacy, veterinary science and art of the University of California are also within the city. There are over 200 charitable agencies and 21 hospitals.

Public Buildings.—The cost of rebuilding San Francisco since the great fire of 1906 is estimated at an amount not far short of the sum spent in the construction of the Panama Canal. During this period the city has been building public structures as never before in its history. The most important of the many new building enterprises is a group of public buildings which forms the Civic Centre, for which a bond issue of \$8,800,000 was raised. Half of this was spent on a city hall. The public library cost another million. The Auditorium was built by the Panama Pacific Exposition at a cost of \$1,275,000. All these buildings are grouped about a spacious plaza, or public square and it is estimated that the paved space will accommodate 20,000 people. Aside from these there is the hall of justice, overlooking the old Plaza, now Portsmouth square, where the first American flag was raised over San Francisco. This building cost \$3,500,000. About \$3,000,000 has been spent on hospitals. The Union Ferry depot, where the gigantic ferry boats connecting the city with the railroads across the bay land, was erected by the State harbor commissioners in 1896 at a cost of over \$1,000,000. It is 659 feet long, 156 feet wide and contains the railroad ticket offices, waiting-rooms, the California development board and the State mining bureau. The United States Appraisers' building also cost over \$1,000,000 and contains the internal revenue, secret service and marine offices. Another big Federal building is that of the United States Mint, ranking second in the country. It is kept constantly in operation coining the gold produced on the Pacific Coast. Another big public building which survived the great fire is the post office, a large structure of granite costing over \$5,000,000. Among the important educational and scientific institutions may be mentioned the Memorial Museum, Palace of Fine Arts, the Mechanics' Institute, the School of Mechanical Arts, the San Francisco Institute of Art, the Lux School of Industry, the Cogswell Polytechnic Institute. There are scores of hotels, theatres, etc. The State University is at Berkeley and the Leland Stanford University at Palo Alto, 33 miles southeast by rail. Among the big office buildings are the

Pacific building, one of the largest reinforced concrete buildings of its kind in the world, the Hobart Building, 21 stories high, and the Claus Spreckels, 19 stories high, which stood throughout the fire that raged on all sides of it.

Manufactures.—In 1914 San Francisco ranked 11th in the United States in the number of its manufacturing establishments. But until the recent discovery of crude petroleum in large quantities in California the city, in common with the rest of the State, suffered a handicap in manufacturing on account of the lack of fuel, which was in part imported from such distant points as England, Australia and Pennsylvania. That difficulty is now removed and crude oil is used for this purpose. There is still the handicap of having to import iron from distant points, but in spite of that the iron industry thrives, as was shown by the shipbuilding that was done during the Great War and is still being continued. The need of mining machinery was really the foundation of the iron industry in San Francisco, and mining machinery is now exported to all parts of the world. The agricultural development of the State has of late been a more important stimulus to the building up of the industries of the city. San Francisco being the nearest port of entry for Hawaiian sugar, much of that product is refined there. Slaughtering and meat packing come next, this industry being supplied by the herds of cattle, flocks of sheep and the hogs which are raised in the interior valleys. The largest fruit and vegetable cannery in the world is located in San Francisco, and the largest shipbuilding plant, drydock, cooperage and cordage factory in the West are also part of the city's industries.

Trade and Commerce.—The commercial importance of San Francisco is even greater than its relative size in regard to population. In 1919 its bank clearings amounted to \$5,629,321,142, which was nearly a million dollars more than the combined bank clearings of the four next largest cities on the coast. In its foreign imports it ranked fifth in the United States and the same in the foreign export of domestic goods. Most of the foreign commerce of the United States on the Pacific passes through San Francisco. A large part of the imports and exports of domestic produce from California and neighboring States also passes through the city, and much Californian and other Pacific Coast produce is gathered at San Francisco and shipped out by rail. The city has, in consequence, extensive wharves and warehouses and a large coastwise trade. In 1918 San Francisco imported \$245,524,209 worth of goods from foreign countries by sea, and exported to foreign countries by sea goods amounting to \$210,562,365. The principal countries to which San Francisco sent domestic products in 1918 were Japan, \$59,378,616; Australia and New Zealand, \$46,877,524; Mexico and Central America, \$8,359,533; Philippine Islands, \$30,676,149; China, \$13,450,929; Dutch East Indies, \$14,657,206. The largest imports of foreign merchandise came from Japan, \$17,406,822; China, \$21,872,230; Australia and New Zealand, \$33,971,032; Straits Settlements, \$34,065,606; Dutch East Indies, \$30,674,778; British India, \$29,790,557. The principal articles imported from abroad during 1918 were rice, sugar, coffee,

SAN FRANCISCO, CAL.

Union Square

copra and tin. The principal articles of foreign export are canned goods, mostly fruit and salmon, raw cotton, iron and steel manufactures, fuel oil, wine and hops.

Finance and Banking.—In 1918 San Francisco ranked third in the United States in average capital per national bank. Bank statistics indicate that one-half the population are savings-bank depositors. The real and personal property of the city was assessed for purposes of taxation at \$780,723,824, of which \$481,457,146 was land assessed as 50 per cent of its true value. The ratio of taxation is \$2.41 on each \$100 of assessed valuation. The city budget for 1918-19 allowed for a total expenditure of \$16,015,747. Of this amount \$1,315,618 was for public works; \$1,003,080 for the board of health; \$1,610,000 for fire protection; \$1,557,396 for police department; \$390,000 for parks and \$3,289,652 was for bond interest and redemption.

Population.—There is probably no city in the United States whose population is so cosmopolitan in character as is that of San Francisco. Not only are all the races and nations of Europe represented here, but the brown races are represented here as nowhere else in the whole country. According to the census figures for 1910 the population was 416,912, of which almost exactly half was composed of native whites. The foreign-born whites constituted 43.1 per cent of the whole and 6.4 per cent were of the colored races. The greatest single foreign element was the German which numbered 24,137, after which came 23,151 Irish, 9,815 English and 6,244 French. The Chinese numbered 10,582, showing a marked decrease since previous years, while the Japanese numbered 4,518. There were only 1,642 negroes in the city. In 1919 the population was estimated at about 607,154. For a truer estimate of the size of San Francisco from the point of view of population, some consideration should be given the suburban towns across the bay—Oakland, Alameda, Berkeley and Sausalito—which are really included within the metropolitan area. About 50,000 commuters come into the city daily from these points. Together these suburban districts include another 400,000 population which, if added to that of the city proper, would make San Francisco the fourth most populous city in the United States. In the past San Francisco has at various times been visited by more or less severe earthquakes. On 18 April 1906 it was shaken by an earthquake more violent than any of previous occurrence, but it was the fire caused by the commotion, rather than the earthquake itself, which caused the loss of life and the tremendous loss of property that followed, the latter amounting to over \$500,000,000. On account of the city's proximity to the vast forests of the Puget Sound region, which makes timber one of the cheapest building materials, most of the dwellings, even to the larger flat houses, were constructed of wood. The result was that when the water mains were dislocated by the earthquake and the fire companies were unable to extinguish the various outbreaks of fire that occurred simultaneously all over the city, the flames soon swept the entire community. The energy and the rapidity with which the city has not only been rebuilt but improved over its condition previous to the fire has been a source of worldwide wonder.

Influence of the Panama Canal.—That the opening of the Panama Canal, with its consequent shortening of sailing routes between San Francisco and the Atlantic ports of both America and Europe, exerted a powerful influence on the commercial and industrial development of the city is beyond doubt. But the brief period that has elapsed since the opening of the canal, together with the abnormal conditions created by the European War, makes it impossible to determine how potent that influence will yet be. In 1915 San Francisco celebrated the opening of the Panama Canal by holding a great international exposition. See SAN FRANCISCO, PANAMA-PACIFIC INTERNATIONAL EXPOSITION.

History.—The site of San Francisco (originally called Yerba Buena by the Spaniards) was first visited by Europeans in the autumn of 1769. Under date of 28 Nov. 1775 Bucareli ordered a fort, presidio, and a mission (Mission Dolores) founded on the Bay of San Francisco. The expedition to carry out this order left Monterey 12 June 1776 and arrived on the peninsula 27 June. Part of the equipment was sent by sea on the *San Carlos* and arrived on 18 August. The ceremony of taking formal possession was held on 17 September, when the Franciscan friars Palou and Cambon founded the first permanent settlement on the peninsula. The ceremonies attending the founding of the mission at San Francisco were held on the 9th of the following October. Vancouver, in his 'Voyage Round the World' (iii, 9), describes the settlement as it appeared in 1792. The presidio represented the military authority, while the pueblo and the mission stood for the civil and religious factors respectively. The earliest towns of California were organized under the laws of Philip II. And "when a pueblo was once established, no matter how or by whom composed and officially and legally recognized as such, it came immediately within the provisions of the general laws relating to pueblos and was entitled to all the rights and privileges, whether political, municipal or of property, which the laws conferred upon such organizations or corporations" (Cal. Rep., 15, 541); and "among these rights was the right to four square leagues of land, in the form of a square, or in such other form as might be permitted by the nature of the situation" (Cal. Rep., 35, 432). Since San Francisco was bounded on three sides by water it was impossible for the town to have four square leagues of land in a square; a line was, therefore, drawn across the peninsula from east to west and "the four square leagues (exclusive of the military reserve, church buildings, etc.) north of this line, constitute the municipal lands of the pueblo of San Francisco" (Cal. Rep., 16, 230). Before 1834 the Territorial governor and the military commandant of the presidio conducted the government of the town. The former imposed license fees and taxes and the latter acted as a judge of first instance. A little later an ayuntamiento was formed, composed of an *alcalde*, two *regidores* and a *sindico*. Between 8 Jan. 1838 and February 1840 the ayuntamiento was abolished, and the government of the town passed into the hands of justices of the peace. In 1846, when San Francisco passed into American hands, it was merely a Mexican village. After the American occupation the ayuntamiento was re-estab-

lished. Commodore Montgomery, after he had raised the flag of the United States at San Francisco, appointed Lieut. Washington A. Bartlett to be the first alcalde of San Francisco under the new régime. Before the American occupation the alcaldes acted as judges of first instance, and they in a large measure made the law which they executed, "at least, they paid but little regard either to American or Mexican law further than suited their own convenience and conduced to their own profit." In 1847 a common council of six persons was elected, and held its first meeting in September of that year. With this the alcalde assumed some of the functions of a mayor. He presided at the meetings of the council and could give a casting vote in case of a tie, but could not participate in the discussion. At this time the police force of the town consisted of two elected constables. The next year, 1848, gold was discovered in California by James W. Marshall. After the news became known the town appeared as if it had been suddenly stricken with a plague. "Its houses were left unoccupied and unprotected; its former trade ceased; its lots fell to a small part of their value; its two weekly newspapers, *The Californian* and *The California Star*, were suspended in May and June; and the town, deserted by the bulk of its inhabitants, was at one time, without a single officer clothed with civil authority." (Moses, 'The Establishment of Municipal Government in San Francisco,' 35). But in October 1848 an election was held and the town government was reconstituted. At an election held on 1 Aug. 1849 there were 1,516 votes cast, and John W. Geary, candidate for the office of first alcalde, received the whole number.

The town was incorporated 15 April 1850. California had already adopted a constitution, but it had not been admitted into the Union. The first municipal election under the charter was held 1 May 1850. The common council held its first meeting on 9 May and proceeded at once to plunder the city treasury. It proposed to fix the salary of the mayor at \$10,000 a year; and at the same sum the salaries of the recorder, the marshal and the city attorney. The other officers, including the members of the council, were to have salaries ranging from \$4,000 to \$6,000 annually. After the admission of California to the Union as a State the city was reincorporated 15 April 1851 and the essential forms of the pre-existing government were retained. When the mail steamer *Oregon* brought the news that California was admitted to the Union (9 Sept. 1850) the inhabitants were "half wild with excitement."

"Business of almost every description was instantly suspended, the courts adjourned in the midst of their work, and men rushed from every house into the streets and towards the wharves, to hail the harbinger of the welcome news. When the steamer rounded Clark's Point and came in front of the city, her masts literally covered with flags and signals, a universal shout arose from ten thousand voices on the wharves, in the streets, upon the hills, house-tops, and the world of shipping in the Bay." And "at night every public thoroughfare was crowded with the rejoicing populace. Almost every large building, all the public saloons and places of amusement were brilliantly illuminated—music from a hundred bands assisted the excitement—numerous balls and parties were hastily got up—bonfires blazed upon the hills, and rockets were incessantly thrown into the air, until the dawn of the following day." (*Annals of San Francisco*, 293.)

In its early history the city suffered from several fires. These occurred 24 Dec. 1849, 4 May 1850, 14 June 1850, 17 Sept. 1850, 4 May

1851 and 22 June 1851. Two effects of these fires were the use of better materials in building and the formation of various hook and ladder, engine and hose companies. They also called attention to the fact that the city was full of criminals who were making profit out of the fires. This fact and the recognized inefficiency and corruption of the city government led a large number of citizens to organize the famous "Vigilance Committee" which flourished in 1851. In August 1850 the Society of California Pioneers was organized. Its declared purpose was "to cultivate the social virtues of its members, to collect and preserve information connected with the early settlement and conquest of the country and to perpetuate the memory of those whose sagacity, enterprise and love of independence induced them to settle in the wilderness and become the germ of a new State." The great production of gold, while it led immediately to the abandonment of the city, was the first important ground of its prosperity. As the output of the mines became more and more abundant, prices rose, imports multiplied and the population increased; but in 1854 the rise had culminated and the flood of gold began to decline. It then became clear that speculation had outrun safe limits, and there followed a severe crisis in mercantile affairs. By 1856 the crime and corruption which were rife in the city had become intolerable to those who wished to live in a decent and orderly community. Affairs reached a critical stage when Mr. King, editor of the *Bulletin*, was murdered by James P. Casey. His vigorous denunciation of crimes and the criminals who infested the city had given great offense. This act was the final incentive to action. The memory of the Vigilance Committee of 1851 was revived and a new organization effected. On Monday Mr. King died and on Tuesday Casey and another murderer by the name of Cora, who had killed United States Marshal Richardson, were tried by the executive committee of the recently formed organization. On Wednesday, Casey and Cora were hanged in front of the Vigilance headquarters. After several months of activities in defiance of the law, the committee disbanded, having rid the city of many criminals and purged it of much of its political corruption. Although there was a decline in the yield of gold in the years between 1854 and 1860, there was at the same time a marked extension of agriculture; by this the continued prosperity of San Francisco was assured. Then following the marvelous development of the silver mines. They brought a sudden increase of wealth and led to a large amount of excited speculation. San Francisco reaped the principal harvest from the silver mines of Nevada. A small group of its citizens acquired immense fortunes from this source. Their wealth may be compared with that of another small group of San Franciscans who became very rich as the chief leaders in the overland railway enterprise.

Railway connection with the eastern United States was established in 1869; the city is now the western terminus of the great continental railroads and of many short lines. The agitation against Chinese labor was begun in 1877 by Denis Kearney (q.v.). On 23 Oct. 1860 San Francisco was connected with New York by telegraph. The free public library was founded

2 Market Street, looking east

in 1879. In 1880 the forcible ejection of poor squatters from the Sand Lots by the Southern Pacific Railroad led to a conflict in which several persons were killed. A panic on the Stock Exchange in December 1886 caused 14 of the principal brokers to suspend. After years of agitation not unaccompanied by disorders and bloodshed, the Chinese Exclusion Act of 1888 removed a long-standing grievance of California in general and San Francisco in particular. In the following year the city suffered a plague of millions of crickets. In 1891 the police destroyed the joss-houses of the "high-binders"—members of a Chinese secret society of blackmailers. The first shipment of block tin extracted from the Temescal mines, Riverside County, Cal., arrived in San Francisco 15 June 1891. The first great exposition was held in the city in 1894; a new charter was ratified in 1898 and came into effect on 8 Jan. 1900, by which the government was vested in the mayor. In 1903-04 political disturbances led to the conviction and imprisonment of two ex-mayors charged with graft (1906-08), an affair which dragged on until 1911. The principles of the initiative and the referendum were incorporated in a series of amendments to the city charter. During 1906-07 an anti-Japanese campaign raged over the question of segregating Japanese pupils in the public schools.

The most important event in the life of San Francisco was the great earthquake which overwhelmed the city on 18 April 1906, followed by a gigantic conflagration which lasted four days and destroyed 497 city blocks covering an area of five square miles. Some 28,188 buildings were demolished, causing damage to the extent of nearly \$1,000,000,000 and the loss of about 500 lives. It was not long, however, before the energy of the citizens succeeded in restoring the place on a grander and more solid scale than before. Within three years some 20,000 new buildings had been erected, mostly fireproof and equipped with the best fire-preventing apparatus. Since the fire 80,092 building permits have been issued, amounting to \$329,773,878. From the ashes of that disaster there has arisen a new and magnificent city, with noble edifices ranged on wide, well-paved thoroughfares, cleanly kept and brilliantly lighted.

L. B. WILSON,

San Francisco Chamber of Commerce.

SAN FRANCISCO BAY, on the coast of California; a land-locked arm of the Pacific Ocean. The channel connecting the bay proper with the ocean is called the Golden Gate. The bay, including San Pablo at its northern point, is 55 miles long and varies in width from 3 to 12 miles. It is the finest bay on the Pacific Coast of the United States. There are a number of islands; Alcatraz, a fortified island, is four miles from the mouth; Angel and Yerba Buena, or Goat Island, are the largest. San Pablo Bay, on the north, is nearly circular in form, about 10 miles across. The Straits of Carquinez connect Suisun Bay with San Pablo. Suisun Bay is about eight miles long and four miles wide. A number of other smaller bays furnish harbor advantages for several villages and towns. Nearly all the drainage of California enters the ocean through this bay. San Francisco (q.v.), Oakland (q.v.) and a number of smaller places are on its coast.

SAN FRANCISCO, PANAMA-PACIFIC INTERNATIONAL EXPOSITION OF 1915. This exposition was held to celebrate the opening of the Panama Canal and the quatercentenary of the discovery of the Pacific, was opened at San Francisco on 6 Feb. 1915 by President Wilson in Washington. He pressed a gold-studded button, whereupon, over 3,000 miles away, the doors of the various exhibitions swung free and mechanical exhibits began to move. The exposition having been decided on several years before, a competition arose between San Francisco and New Orleans as to which of the two cities should be the seat of the undertaking. Private enterprise in San Francisco promised \$7,500,000 and the State and municipality authorized an appropriation each of \$5,000,000. In March 1911 Congress selected San Francisco for the undertaking, and on 14 October in the same year President Taft turned the first shovelful of earth on the chosen site. The location fronted San Francisco Bay for nearly two and a half miles from Van Ness avenue and Fort Mason to and within the Presidio. Its average depth was about half a mile from the bay to the residential section of the city, and comprised an area of approximately 625 acres. Divided into three sections, the central space was assigned to the division of exhibits, where 11 magnificent palaces were erected at a cost of about \$12,000,000, each devoted to some specific exhibit—art, education, agriculture, transportation, machinery, etc. No charge was made for exhibit space. In 1912 a commission of five visited Europe to invite participation. Invitations were also issued to foreign countries to send warships to assemble with those of the United States. Altogether 42 nations and 43 States produced some 80,000 exhibits, which were reviewed by an international jury of awards. The opening address was delivered by Secretary of the Interior Franklin Knight Lane of California. It was estimated

that 400,000 persons visited the grounds on the first day. The splendor of the buildings, the innumerable attractions and shows, the beautiful scenery, tournaments, sports, historic collections, pageants and Orientalia presented a spectacle never before witnessed. The total receipts amounted to \$12,524,090, of which \$4,715,523 was derived from admission fees, the total number of visitors being 18,756,148. The gross receipts from concessions were \$7,809,565; net revenue from the same, \$1,830,331. The responsibility for the conduct of the undertaking rested entirely upon the State of California and the city of San Francisco, which, together with corporations and individuals, subscribed over \$20,000,000 to finance the scheme.

C., 'Education Exhibits at the Exposition' (Washington 1916).

SAN FRANCISCO MOUNTAIN, a conical mass with area of about 40 square miles rising about 5,000 feet above the Arizona Plateau, a few miles north of Flagstaff, Coconino County, Arizona. Its two highest summits are San Francisco Peak, 12,611 feet and Agassiz Peak, 12,340 feet. The mountain consists of moderately old lavas and breccias, the products of five distinct stages of eruption. The old vent is near the centre and the top has been somewhat lowered by erosion. It is estimated that the lava outflows had a volume of 38 cubic miles and they piled up as a viscous mass on a platform of Kaibab limestone, constituting the general plateau. The mountains are partly covered with pine woods. From the top there is a wonderful view of Grand Canyon to north, Painted Desert and Hopi Buttes to east and many recent cinder cones and lava flows on all sides. Consult Robinson, H. H. (in United States Geological Survey, Prof. Paper 76).

SAN GERMAN, san hër-män', Porto Rico, city, near the southwestern coast, 35 miles southwest of Arecibo. It was settled in 1511. It is in a fertile agricultural region, the prosperity of which has, however, declined. It is a picturesque town, with narrow old-fashioned streets; it contains several churches, a Dominican convent, hospitals and a seminary, and exports sugar, coffee, tobacco and fruit. An efficient public school system has been established under the American control. Pop. city 4,999; pop. municipal district, 25,000.

SAN GERMANO, Italy. See CASSINO.

SAN GIULIANO, sän jool-yä'nō, **Antonino**, MARQUIS DE, Italian diplomat and statesman: b. Catania, 1852; d. Rome, 16 Oct. 1914. He was educated at the University of Catania, studied law, in 1882 was elected to the House of Deputies and afterward was life Senator. He was Under Secretary for Agriculture in the Giolitti ministry in 1892-93, and Minister of Posts and Telegraphs in the Pelloux ministry in 1899-1900. He was appointed Foreign Minister in the Fortis ministry in December 1905, but early in 1906 was sent as Ambassador to London, remaining in that office until 1910, when he returned home to become Minister for Foreign Affairs in the Luzzatti Cabinet. He also served in this capacity through the succeeding Giolitti and Salandra ministries. Under his tenure of office Italy declared her neutrality in the European War on the grounds that in a war of aggression her treaty obligations to Germany and Austria were not to be enforced. He resigned 3 Oct. 1914, but the government refused to accept his retirement and he directed the affairs of the Foreign Office from his sick room, so far as was possible, until his death, a few days later.

SAN ILDEFONSO, èl'dā-fōn'sō, or **LA GRANJA**, **Treaties of**, two secret agreements between France and Spain, both extremely disadvantageous to Spain. (1) Arranged in 1796, while France was at war with England, pledged the two countries to support each other in time of war with 25 ships and 24,000 troops, of which 6,000 were to be cavalry; an agreement which at once involved Spain in the war then in progress and for which she was severely punished by England. (2) Concluded 1 Oct. 1800 and ratified 30 Oct. 1800, by which Spain re-ceded to France the territory of Louisiana, with the understanding that the territory was not to be sold by France except to Spain; in return for which Napoleon agreed to make the Duke of Parma king, adding either Tuscany or the Roman legations to his territory, so that the population of his kingdom should be above a million. Napoleon, however, disregarded the treaty and sold Louisiana to the United States without consulting Spain.

SAN ISIDRO, è-sè'drō, Philippines, pueblo, capital of the province of Neuva Ecija, Luzon, on the Grande de la Pampanga River, 48 miles north of Manila. It is a well-built town, at the intersection of several main highways which connect it with Manila, with several points on the Manila and Dagupan Railroad and with other important towns. It is in a fertile agricultural region and has a considerable trade. Pop. 9,800.

SAN JACINTO, ja-sin'tō, **Battle of**, in American history, a notable battle of the Mexican War that decided the independence of Texas. It was a desperate engagement between a Mexican force of 1,600 in command of Santa Ana and 783 Texans led by Sam Houston, 21 April 1836. The Mexicans were defeated and utterly routed. The scene of this event was on the banks of the San Jacinto River, 17 miles southeast of the present city of Houston.

SAN JOAQUIN, hō-ä-kën', Philippines, pueblo, province of Iloilo, island of Panay, on the southeast coast, 31 miles southwest of

R. I. Aitken, Sculptor

A SYMBOL OF AMERICAN MASTERY OF THE PACIFIC

**The Figure of Victory on the Monument erected in San Francisco to Commemorate the
Battle of Manila Bay**

Iloilo, the provincial capital. It is on the coast highway. Pop. 14,333.

SAN JOAQUIN, a river of California which has its rise in a small glacier southeast of the Yosemite Valley, near Mount Lyell, on the east slope of the Sierra Nevada. It flows southwest about 100 miles; then in Fresno County it changes its course to a northwest direction to its confluence with the Sacramento River; then flows west into Suisun Bay. In Fresno County it receives the waters of Tulare system of lakes through King's River, after which it passes through the Sanjon, or Big Salt, Slough. It is about 350 miles long, and is navigable for 50 miles to Stockton all the year, and in winter and spring about 200 miles farther. The valley through which the San Joaquin flows is noted for its fertility.

SAN JOSÉ, hō-sā', Cal., city, county-seat of Santa Clara County, on the Coyote and the Guadalupe rivers, and on the Southern Pacific Railroad, 47 miles southeast of San Francisco, eight miles from San Francisco Bay, and 28 miles north by east of Santa Cruz. It is connected by railroad with Santa Cruz and Monterey, both on the Pacific, and with San Francisco by three lines of railroad and by water. The first settlement was made about 1770 and the pueblo of San José was established in 1782. It was the State capital under the first constitution of California. The completion of the overland railroad, in 1869, and the further development of transportation facilities, have aided greatly in promoting the prosperity of the city. The form of the city is that of a parallelogram; the streets are wide, well shaded, and clean. The four public parks, the excellent roads extending out into the valley, the equable climate, all contribute toward making San José a desirable residential city. It is situated in a fertile agricultural region, the beautiful Santa Clara Valley, famed for the variety and amount of its fruit. There are 37 large canneries, 30 packing-houses, and shipping establishments connected with the fruit industry, also flour mills, lumber mills, basket and box factories, a foundry, machine shops, yards for marble-cutting and granite polishing, tanneries and several other industrial establishments. The annual output of the farm and fruit products is valued at \$25,000,000.

The principal public buildings are the government building, which cost \$200,000; the city hall, in the Plaza; the courthouse and Hall of Records, opposite Saint James Park; the Y. M. C. A. building, the Y. W. C. A. building, the churches, schools and charitable institutions. There are 32 churches, representing 12 different denominations; five religious societies not having churches, and several missions, among which are the Florence Night Mission and Christ's Rescue Mission.

The educational institutions are the State Normal School, in Washington Square, a park of 28 acres; the University of the Pacific (Methodist Episcopal); Notre Dame College (Roman Catholic), for young women; Academy of Notre Dame (Roman Catholic); Notre Dame College (Roman Catholic), for boys; Notre Dame Institute (Roman Catholic), a training and technical school for orphans; a public high school, six public kindergartens, public and parish elementary schools, two com-

mercial colleges, four private schools and a public library. The charitable institutions are the Pratt Home for Old Ladies, the O'Connor Sanatorium, the San José Sanatorium and Home, Josephinum Orphanage and the Home of Benevolence, maintained by the Ladies' Benevolent Association. Numerous medicinal mineral springs are in Alum Rock Park, several miles east of the city; area, 1,000 acres.

The annual amount expended for municipal maintenance and operation is about \$250,000. The national bank has a capital of \$300,000, and the five State banks a combined capital of \$2,200,000. Pop. 58,000.

JAS. T. BROOKS,

Secretary San José Chamber of Commerce.

SAN JOSÉ, Costa Rica, capital of the republic, on an elevated plateau 4,500 feet above sea-level, about 15 miles northwest of Cartago (the ancient capital), with which it is connected by rail. It is in a rich agricultural district and is a centre of commerce, on the international railway from Puerto Limon to Punta Arenas. The most conspicuous buildings are the palaces of the president, and the bishop and the National Palace; the University, to which is attached a medical school and a museum; the restored cathedral, and the National Theatre, a monument of artistic beauty, containing Italian marbles, pillars, columns, statues, and frescoes, and in its elaborate decorations resembling the Library of Congress at Washington. It cost almost \$1,000,000. There is a good school system and the city is progressive. The merchants are mostly foreigners. The railroads, banks and electric-light plants were largely built by English capital. The French are the chief coffee-growers; the United States are mainly interested in the railroads, mines, cattle ranches, and the banana industry. Coffee is the principal product. San José is a popular health resort. Pop. 34,784; with suburbs, 49,750.

SAN JOSÉ, Guatemala, the chief port of the republic, on the Pacific Ocean. It is the starting point for the railroad trains to the capital, and a steamer station. The exports are cochineal, indigo, sarsaparilla, wood, flax, coffee, sugar, cotton, hides and rubber. Pop. 1,500.

SAN JOSÉ, Philippines, pueblo, province of Batangas, Luzon, on the Malaquintúbig River, 10 miles north of Batangas, the provincial capital. It is on the main highway, and on the line of a projected railroad, and is a military and telegraph station. Pop. 8,996.

There are also several smaller pueblos of this name: (1) pueblo, province of Bulacán, Luzon; destroyed by the Spaniards in the insurrection; pop. 1,378; (2) pueblo, island of Corregidor, 27 miles southwest of Manila; chief town of the island with good anchorage; pop. 574; (3) pueblo, de Pampanga River, 11 miles northeast of San province of Nueva Ecija, Luzon, on the Grande Isidro; a road centre; pop. 852.

SAN JOSÉ DE BUENAVISTA, dā bwā-nā-vēs'tā, Philippines, pueblo, capital of the province of Antique, Panay; on the west coast. The town has a good harbor, carries on an active trade by sea with Iloilo, and is con-

nected by highway with the other towns of the province. Pop. 6,768.

SAN JOSÉ DE CUCUTA, *dā koo'koo-tā*. See CUCUTA.

SAN JOSÉ DE LAGONOY, *dā lā-gō-noi'*, pueblo, province of Ambos Camarines, Luzon, 22 miles northeast of Nueva Cáceres. It is the most important town of the sub-district of Lagonoy, which is largely isolated from the rest of the province. Pop. 8,314.

SAN JOSÉ SCALE. See SCALE INSECTS; ORANGE PESTS.

SAN JUAN, Philippines, pueblo, province of La Union, Luzon, on the west coast, four miles north of San Fernando. It is on the main highway. Pop. 11,223. There is also a smaller pueblo of the same name in the province of Bohol.

SAN JUAN, *hoo-ān*, or **SAN JUAN DE LA FRONTERA**, *dā lā frōn-tā'rā*, Argentina, (1) capital of the province of the same name, east of the River San Juan, on the eastern slope of the lower Cordilleras, north of Mendoza. It is the see of a bishop. The principal buildings are the bank, national college, normal school, large seminary, hospital and custom house. There is some export trade in wine and cattle. Pop. 15,262. (2) The province covers an area of 37,865 square miles. On the west the Cordilleras are interspersed with fertile valleys, on the east are found salt steppes or pampas. In the Andes lofty peaks rise to the height of 5,580 (Cerro Gordo) to 6,798 (Meredario) metres. East of the Rio Jachal are high mountains, then follows the chain of the Sierra Huerta. The principal streams are Rio Vermegio and Rio Sanjon; on the southern frontier extends the large lake of Guana-cache. Gold and copper mines are operated. The climate is mild and the country well watered. Grapes, olives and wheat are extensively cultivated. Pop. 130,412.

SAN JUAN, or **SAN JUAN DE PORTO RICO**, Porto Rico, city, capital of the island; built on a small island adjacent to the northeastern coast, connected with the mainland by a bridge. It was founded in 1511 by Ponce de Leon, and was strongly fortified. It was attacked by the Dutch in 1625 and on several occasions by the English, the last time in 1797, when a large force under Abercrombie laid siege to the city; its fortifications, however, rendered it impregnable. In 1898 it was occupied by American troops, and remains the seat of government for the island under American rule. The main part of the town is enclosed by mediæval ramparts and defended by Morro Castle, at the entrance of the harbor, forts Sant Elena and San German, and the citadel of San Cristobal. Within the walls the city is laid out in regular squares; the houses are substantially built and the streets well paved. Sanitation was neglected under Spanish rule, but after the American occupation the best sanitary measures were strictly enforced, and the general health of the city greatly improved. It contains a number of notable public buildings, including the bishop's palace, a large cathedral, the old government building, the city hall, the casa blanca, the custom house, a military hospital, an arsenal, a Jesuit college, a Carnegie library, and a theatre. It has a trol-

ley car system which connects it with the pretty suburban towns, Santurce and Rio Piedras. The harbor is one of the best in the West Indies, affording anchorage for the largest ships. The entrance, however, is very narrow and difficult for navigation. In 1912 a harbor board was created and bonds totaling \$500,000 were authorized, to which \$100,000 was later added, for the purpose of enlarging and improving the harbor. This work will transform the city into the most commodious, safe and modern port in this part of the world. Another local improvement of much importance is the new bulkhead completed in 1917. This is of reinforced concrete on piles, is 2,000 feet long, has its eastern end covered with a steel shed 841 feet long and 24-54 feet wide, and provides a depth of water of 18-24 feet. At the same time the marginal boulevard was undergoing a radical transformation in keeping with the new harbor work. In the calendar year 1917 the imports of merchandise at the port of San Juan from the United States had a value of \$3,866,565, and the exports to the United States \$9,535,712. After the United States entered the World War the citizens of San Juan organized a Red Cross chapter, and subscribed liberally to the various Liberty loans. The public school system of graded schools includes a high school, which is open to pupils from all parts of the island. There are also several special schools established by the government, including night schools, an industrial school, an experimental kindergarten, and a school for trained nurses. Pop. (1899) 32,048; (1910) 48,716.

SAN JUAN, Central America, a river forming the outlet of Lake Nicaragua, and flowing southeastward on the boundary between Nicaragua and Costa Rica into the Caribbean Sea. Part of it would have formed a link in the interoceanic waterway if the Nicaragua Canal had been decided on. It is 130 miles long, and for the greater part of its course is a broad, deep and tranquil stream. It is, however, completely blocked at five places by rapids, of which the Machuca Rapids are the largest. The river enters the sea through a large delta, one arm of which forms the harbor of Greytown, though the bar is too shallow for large vessels.

SAN JUAN BAUTISTA, *bow-tēs'tā*, Mexico, the capital of the state of Tabasco, situated on the Rio Grijalva near the centre of the state. It is built on low and level ground, has street-car lines and several pretentious buildings, such as the government palace, a theatre, and several churches. It is the trade depot for the interior of Tabasco and northern Chiapas. Pop. about 10,000.

SAN JUAN DE BOCBCOC, *dā bōk-bōk'*, Philippines, pueblo, province of Batangas, Luzon, on Tayabas Bay at the mouth of the Sinturis (or Lanay) River. There are two towns, the old town built directly on the bay, the new town further inland on the river. Many horses are raised in the surrounding region. Pop. 14,017.

SAN JUAN BOUNDARIES. See BOUNDARIES OF THE UNITED STATES.

SAN JUAN HILL, Battle of. See **SANTIAGO DE CUBA**.

SAN JUAN ISLANDS, a group belonging to the State of Washington. They begin in the Strait of Georgia and extend south into Puget Sound. The largest islands of the group are San Juan, Oreas, Lopez and Shaw. In 1850 these islands were claimed by both the United States and Great Britain, and both American and British garrisons were on the islands. See **SAN JUAN QUESTION**.

SAN JUAN DEL MEZQUITAL, *dəl mäs-kē-täl'*, Mexico, a town in the northwestern part of the state of Zacatecas.

SAN JUAN MOUNTAINS. The southern part of the western range of the Rocky Mountains in southwestern Colorado, mostly in San Juan, San Miguel, Mineral, Hinsdale, Archuleta, Rio Grande and Conejos counties. About 100 miles long from northwest to southeast. Many of its peaks are more than 13,000 feet above sea-level, Mount Wilson 14,250 feet high being the highest. These mountains consist of a great variety of sedimentary and igneous rocks with many rich mines of various kinds notably in the Silverton, Telluride and Ouray districts. A southern extension of the same uplift extends along the east side of Rio Arriba County, New Mexico.

SAN JUAN QUESTION, in American history an early boundary line dispute between the United States and Great Britain. In negotiating the treaty of 1846, by which the 49th parallel, from the Rocky Mountains to the sea, was made the boundary, a controversy arose concerning the course of the line through the channel which divides Vancouver Island from the mainland. The Americans contended for the Canal de Haro, the British for the Rosario Strait. To avoid conflict, it was decided that both nations occupy the island of San Juan at opposite ends. In 1872 Emperor Wilhelm I of Germany, acting as arbitrator, decided for the United States.

SAN JUAN DE NICARAGUA, *dä nē-kä-rä'gwä*, or **SAN JUAN DEL NORTE**, *dəl nōr'tä*. See **GREYTOWN**.

SAN JUAN DEL RIO, *dəl rē'ō*, Mexico, a town in the state of Querétaro, situated about 30 miles southeast of Querétaro, with which it is connected by railway. It is surrounded by beautiful gardens, and there are important silver mines in the neighborhood.

SAN JUAN RIVER. One of the large branches of Colorado River in southeastern Utah and northwestern New Mexico with its main affluent Rio de las Animas heading in the San Juan Mountains in southwestern Colorado. Total length about 250 miles. The lower part of its course is in a deep canyon which opens into that of Colorado River above Glen Canyon.

SAN JUAN DEL SUR, *dəl soor*, Nicaragua, a port on the Pacific Coast in the southwestern corner of the republic. It has a safe harbor and is the commercial outlet for the products of southwestern Nicaragua. It has submarine cable connection with Mexico and Panama, and is a station for regular steamers. The terminus of the proposed Nicaragua Canal would have come a little to the north of the town.

SAN JUAN DE ULÚA, *dä oo-loo'ä*, or **ULLOA**, Mexico, a fort defense in the east of the harbor of Vera Cruz, standing upon a small island of its own name. Here Cortes made his first landing in 1519. The fort was built in the 17th century and was of great strength. It has figured conspicuously in the history of Mexico.

SAN LEANDRO, Cal., city in Alameda County, on San Leandro Creek, 17 miles east of San Francisco, on the Southern Pacific and the Western Pacific railroads. There are canneries, manufactures of farm implements, hay pressing works and a considerable lumber industry. Pop. 3,471.

SAN LORENZO EL REAL, Treaty of. See **BOUNDARIES OF THE UNITED STATES**.

SAN LUCAR DE BARRAMEDA, *loo'-kär dä bär-rä-mä'thä*, Spain, a seaport, province of Cadiz, Andalusia, at the mouth of the Guadalquivir, 18 miles north of Cadiz. The most conspicuous buildings are several convents and the palace of the Duc de Montpensier, containing valuable art treasures; the ruins of a Moorish castle; churches; townhouse and the hospital of St. George, which dates from 1517. There are good schools directed by religious orders generally. The chief occupations of the inhabitants are fishing and the culture of grapes, olives, tropical fruits and vegetables, and there is considerable trade in sherry wines. The chief imports are coal from England; sulphur and vegetables from France; exports, salt, wine, fruit and oats. Columbus embarked from this point on his third voyage, and Magellan on his voyage of 1519. Pop. about 25,000.

SAN LUIS, *loo-ēs'*, or **SAN LUIS DE LA PUNTA**, Argentina, (1) Capital of the province of that name, at the southern extremity of the Sierra of San Luis, on the Chorillo, 480 miles northwest of Buenos Aires on the transcontinental railway. It has a national college, normal and primary schools and a branch bank; also water supply. The chief industries are the manufacture of *ponchos*, and trade in horses, hides and wool. It was founded in 1597, consists of adobe huts, and is surrounded by forests of ferns. Pop. (est.) 10,000. (2) The province is situated in the central west of the republic, with an area of 29,035 square miles. At the northeast terminates the Sierra de Cordoba; through the northeast extends the Sierra de San Luis rich in copper and precious metals, which are, however, little exploited. In the south extend salty pampas. The climate is dry and healthful, marked by great extremes. The rivers are not navigable; transportation facilities are poor, and there is little industry. Pop. 126,895.

SAN LUIS OBISPO, *ō-bēs'pō*, Cal., city, county-seat of San Luis Obispo County, on the Southern Pacific Railroad, about nine miles from Port San Luis (Port Harford) on San Luis Obispo Bay, an arm of the Pacific Ocean, and midway between San Francisco and Los Angeles. It is in an agricultural and stock-raising region. The industries are chiefly connected with the farm and dairy products, the cultivation and shipping of fruits and nuts, and the transportation and refining of oil. Port San Luis is the most important oil port in California. The educational institutions are

the California Polytechnic School (State), a high school, public and parish schools. There are two banks in San Luis Obispo, one State bank and one national bank, with combined total assets of over \$4,147,533. Pop. 6,000.

SAN LUIS POTOSI, pō-tō-sē', Mexico, an inland state. bounded by the states of Coahuila, Nuevo Leon, Tamaulipas, Veracruz, Hidalgo, Queretaro, Guanajuato, Jalisco, and Zacatecas. It is divided into 13 districts, has an area of 25,316 square miles, and a population of 627,800. Its surface for the most part lies within the great plateau of Mexico, but the southeastern part in the valley of the Panuco is several thousand feet lower than the rest of the state. Fever and malaria are prevalent in the low elevations but the climate is healthful in the part of the state on the plateau. The soil is fertile and there is an abundance of forest. Agriculture is in a backward state. Tropical fruits are grown to some extent and stock-raising is becoming important. Gold, copper, lead, silver, iron, mercury, zinc, and petroleum are found in considerable quantities, and the mining and extraction of these is now the state's leading industry. Manufacturing and commerce have shown a decided upward trend in recent years. The principal cities and towns are San Luis Potosi (the capital) (q.v.), Catorce, Matehuala, and Rio Verde.

SAN LUIS POTOSI, Mexico, capital of the state of San Luis Potosi and fourth largest city in the republic, 326 miles from Mexico City by the National Railway, 477 miles from the United States border at Laredo, Texas, and 275 miles from the Gulf of Mexico at Tampico by the Mexican Central Railway, altitude 6,250 feet above the sea. It is the centre of an important mineral and smelting interest, extensive ore deposits existing in almost every direction and is the home of the greatest silver-lead reduction works in the world,—the smelting plant of the Compania Metalurgica Mexicana, with a capacity of 1,000 tons daily and requiring the services of 1,400 men in all departments. As a distributing and general business centre the city is regarded as one of the most important and promising in the republic. The opening of the port of Tampico has proven very beneficial to its commercial interests. Its manufacturing industries include clothing, furniture, cotton goods, tallow and other articles of commercial importance. It has a street railway, telephone service and an excellent electric lighting system. The governor's palace of rose colored stone is an imposing building and the cathedral is one of the notable ones of the country. A university, The Instituto Cientifico, in which the professions and exact sciences are taught, is the principal educational institution of the city. There are also a scientific museum, with a library of over 15,000 volumes and five other libraries, with a total of some 10,000 volumes. A fine statue of the patriot Hidalgo, occupies a prominent place in the Alameda or principal public square. This city is the seat of one of the most important Catholic archbishoprics in the republic. The local bank of issue is the Bank of San Luis Potosi, with a capital of \$1,100,000; but there are branches or agencies of the National Bank and the London and Mexico Bank, both of Mexico City. The city was founded about

1550 and has played an important part in the Mexican civil wars; in 1863 was the seat of government under Juarez; later was occupied by Bazaine and recovered by Juarez in 1867. Pop. 68,022.

SAN MARCOS, mār'kōs, Tex., town and county-seat of Hays County, on the San Marcos River and on the International and Great Northern and the Missouri, Kansas and Texas railroads, 30 miles southwest of Austin. It became the county-seat on the organization of the county in 1848. It is in an agricultural region, cotton and corn being the chief products; stock-raising is also carried on in the vicinity. The town contains steam cotton-gins and cottonseed-oil mills, also a United States fish culture station. There are two national banks with a combined capital of \$130,000. A group of boiling springs is located within the town limits. It has a public high school, established in 1891; and contains the grounds of the Texas Chautauqua Association. It is also the seat of the Coronal Institute, a secondary school established by the Methodist Episcopal Church South in 1879 and of the Lone Star Business School, the Southwest Texas Normal, established in 1905, with an enrolment of 1,000 students, the San Marcos Baptist Academy, established in 1909 and costing between \$175,000 and \$200,000 and the Southwestern Conservatory of Music, established in 1915 and enrolling 110 the first term. A summer resort affording accommodation for 500 is located here. The town has seven churches and three missions. It is on the government highway between Austin and San Antonio. Pop. 5,065.

SAN MARINO, mā-rē'nō, Europe, the smallest republic in the world and claiming to be the oldest state in Europe, comprises an area of 38 square miles, enclosed by Italian territory, among the terminating spurs of the Apennines near the Adriatic Coast. The government is peculiar and eminently democratic; Its legislative power is vested in a Great Council of 60 members elected by popular vote, two of whom are appointed every six months to act as regents and a smaller Council of 12 members, divided into four congresses or departments. The executive authority is exercised by the regents. There is no public debt. The town, standing on a mountainous crag 2,420 feet high, was built round a hermitage dating from 441 and is surrounded by a great wall with forts. But one road enters the town. Borgo is an aristocratic suburb at the foot of the hill. Silk is the principal manufacture. There are numerous massive and stately buildings including the governor's palace and six churches, one of which contains the tomb and statue of Saint Marino, besides several schools, a museum, theatre, town-hall and convents. Agriculture is the chief pursuit. A new treaty of friendship with Italy was signed in 1907 and revised in 1908 and 1914. The republic has extradition treaties with England, Belgium, Holland and the United States. On 24 May 1915 the republic declared war against Austria-Hungary, the day following the similar Italian declaration. Pop. 11,513.

SAN MARINO, Order of. See ORDERS, ROYAL.

SAN MARTIN, José de, hō-sā' dā sán mār-tēn', South American general: b. Yapeyu, Argentina, 25 Feb. 1778; d. Boulogne, France, 17 Aug. 1850. He was educated in Spain and entered the army in 1791. In 1811 he attained the rank of lieutenant-colonel, but resigned and sailed for Buenos Aires in 1812, where he offered his services in the cause of independence. He defeated the viceroy Vigodet on 13 Jan. 1813 at San Lorenzo and the next year, being appointed commander-in-chief of the army of Upper Peru, prepared to attack the Spanish forces by an approach through Chile. An army of invasion was drilled for two years at Mendoza, whence San Martin began 17 Jan. 1817, his famous march over the Andes, leading his army through the Uspallata Pass. On 12 Feb. 1817, he gained the victory of Chacabuco and captured and occupied Santiago 15 February. He was defeated on 19 March 1818 at Cancha Rayada, but repulsed the royalists on 5 April at the Maipo and drove the Spaniards from Chile. He next invaded Peru and captured and occupied Lima, 12 July 1821. On 27 July he proclaimed the independence of Peru and on 3 August was appointed protector. He resigned his office to the Peruvian Congress, 22 August, leaving Bolivar to complete the independence of Peru. He then went to France and lived there till his death.

SAN MIGUEL, sán mē-gēl', Salvador, the capital of a department of the same name on the San Miguel River, nine miles east of the active volcano of San Miguel (7,775 feet), and 70 miles southeast of San Salvador. It is an active commercial and agricultural centre, noted for its great annual fair. Indigo is an important article of commerce. The climate is malarious. Pop. 24,768.

SAN MIGUEL ALLENDE, āl-yēn'dā, Mexico, a manufacturing city in the state of Guanajuato, on the Rio de la Lara and on the Mexican National Railroad, 34 miles north of Ceyala; named after the Mexican patriot, Gen. Ignacio Allende (1779-1811), who was born here. Woolens, saddles and weapons are the chief articles produced. Pop. 39,000.

SAN MIGUEL DE MAYUMO, dā mā-yoo' mō, Philippines, Pueblo, province of Bulacán, Luzón, on the San Miguel River, 26 miles north of Bulacán. It is on the main highway at the junction of several others; and the river is navigable for native craft. It is the commercial centre of a fertile agricultural region; excellent timber is obtained on the surrounding mountains; iron is mined at Sibul, eight miles distant; and gold and petroleum are known to exist in the vicinity, but are without paying exploitation, the chief manufactures are cloth goods. The climate is especially healthful and there are medicinal springs in the vicinity of the iron mines. The town suffered considerable damage during the insurrection on account of its proximity to insurgents' hiding places in the mountains. Pop. 14,919.

SAN MINIATO, mē-nē-ā'tō, Italy, in the province of Florence, 21 miles west of the city of Florence, on the Arno. The ancient cathedral dates from the 10th century and is adorned with many interesting monuments. Glass, olive oil, hats and leather are manufactured. The

town has considerable historical interest, especially as being the cradle of the Napoleon family.

SAN NICOLAS, ne-kō-lās', Philippines, (1) Former pueblo of the province of Cebú, incorporated as a part of the municipality of Cebú, the provincial capital in 1901. Pop. 18,330. (2) Pueblo, province of Ilocos Norte, on the Laoag River, three miles south of Laoag. It is on the coast highway. Pop. 10,880. (3) Pueblo, province of Pangasinán, near the Agno River, 34 miles east of Lingayén. It is connected with Lingayén and also with towns to the south by highway. Pop. 9,780.

SAN NICOLAS, or SAN NICOLAS DE LOS ARROYOS, dā lōs ār-rō'yōs, Argentina, a town in the province of Buenos Aires, situated at the head of the delta of the Paraná, 35 miles southeast of Rosario, with which it is connected by rail. It is an important railroad centre and a station for ocean steamers. It has electric light and street railways, large beef-packing houses, flour-mills and distilleries. The chief exports are wool and cattle products.

SAN PABLO, pā'blō, Philippines, pueblo, province of Laguna, Luzon; 17 miles south by west of Santa Cruz. It is on the main road from Santa Cruz to Tayabas, at the junction of other highways. It is the centre of an area of volcanic elevations, with five small mountain lakes in the vicinity. There are indications of valuable mineral deposits. Pop. 22,612.

SAN PABLO BAY. See SAN FRANCISCO BAY.

SAN PEDRO, pē'drō, Cal., city and port of entry, annexed to Los Angeles, 1909; on San Pedro Bay, an inlet of the Pacific Ocean and on the San Pedro, Los Angeles and Southern Line and the Southern Pacific railroads, 22 miles south of Los Angeles. The harbor, enlarged and otherwise improved by the Federal government is one of the best on the Pacific Coast. The breakwater, 8,000 feet long, cost over \$3,000,000. The harbor improvements, completed in 1904, afford a clear depth of 30 feet, permitting the largest vessels to enter the inner harbor. San Pedro is in an agricultural region and near sections in which there is considerable mining. Its chief industries are connected with exporting grain, fruit and minerals. Pop. about 14,000 before annexation. See LOS ANGELES.

SAN PEDRO, Paraguay, a town situated on a branch of the Paraguay River, about 100 miles north of Asunción. It is accessible for small steamers and exports maté. Pop. 8,700.

SAN PIOQUINTO, pē'ō kēn'tō, Philippines, a port on the western coast of Camiguin Island, north of Luzon, extending two miles inland and three miles wide. It is sheltered by Font Island lying in the middle of the entrance with a channel on each side. Near the entrance to the south is a boiling spring of salt water, regarded as evidence of comparatively recent volcanic activity in this and the Batanes group on the north and the north sections of Luzon on the south. A stream of fresh water enters this harbor. It is one of the principal cruising stations of the United States navy in the waters of the northern Philippines; here, on 3 May 1899 the United States steamship *Concord*

raised the United States flag; and here, later, the crew of the wrecked United States steamship *Charleston* camped till rescued.

SAN RAFAEL, rā-fā-ēl', Cal., town, county-seat of Marin County, on San Pablo Strait and on the Northwestern Pacific Railroad, 15 miles north of San Francisco. It is the centre of a stock-raising, dairying, agricultural and suburban region and has frequent communication with San Francisco both by railroad and ferry. It is situated near Mount Tamalpais and is a well-known health resort. It contains Saint Vincent's Male Orphan Asylum. It has a public high school, with a library of about 16,000 volumes and is the seat of San Rafael Institute, the Dominican College (for girls), a Roman Catholic secondary institution, the Hitchcock Military Academy and the Mount Tamalpais Military Academy. Pop. (1915) 7,650. Also has water transportation with San Francisco Bay; \$70,000 municipal bath house (natatorium); about six miles of paved streets; \$3,000,000 municipal water system; San Francisco Theological Seminary (Presbyterian); Presbyterian Orphanage and Farm; now city of second class governed by city council and city manager; picturesque scenic suburban city with particularly salubrious climate free from fogs and winds.

SAN REMO, rā'mō, Italy, city and seaport, in the province of Porto Maurizio, 30 miles northeast of Nice, on the Mediterranean, in the famous Riviera district and a much frequented health and pleasure resort. The town is terraced, the ancient upper town with narrow and crooked streets lined with lofty buildings forming a strong contrast to the modern edifices of the lower town. Among its attractions are the cathedral, the Santurio della Guardia, the Santurio dell'Assunta with four handsome alabaster pillars and the palace of the Marquis Borrea d'Olmo, the latter containing a noted picture gallery. The city is so ancient that its origin is obscure. It was self-governed in 1170 and one of its bishops later sold it to Genoa. Pop. about 22,000.

SAN SALVADOR, sāl'vā-dōr, Salvador, city and capital of the republic, situated near the base of the volcano San Salvador about 25 miles from the port of La Libertad on the Pacific Coast with which it has rail connection, in a pleasant valley at an altitude of 2,102 feet, the cone of the volcano rising distinctly above it. The city is well laid out, having many pleasant parks and suburban resorts. It is subject to earthquakes and this fact has modified the methods of house construction, all the houses being low and surrounded by open areas. Its most noteworthy building is the Casa Blanca (white house), the residence of the President. Other notable structures are the library, university and observatory. The city is an important industrial centre; its manufactured products including soap, cigars, candles, cotton cloth, sugar and spirits. It is also a thriving commercial centre, doing a large trade in the products of the region, especially indigo and tobacco. It is the official residence of the United States Minister to El Salvador and the seat of a United States consul-general. Jorge de Alvarado founded San Salvador in 1525. An earthquake all but destroyed it in 1854, another laid it low in 1873 and that of

1917, when millions of dollars' worth of property were destroyed, is still vividly remembered. In spite of these fateful blows from nature and devastating waves of man-made revolutions, San Salvador to-day is reckoned among the important cities of the American mid-continent. Pop. 60,000.

SAN SEBASTIAN, sã-bās-tē-ān', Spain, capital of the province of Guipuzcoa on the Bay of Biscay, 42 miles northwest of Pampeluna, is a port and a natural and fortified stronghold. It has been the summer resort of the Cortes since 1886. The principal buildings are the churches of San Maria and San Vicente, a nunnery, the courthouse, the schools of navigation, commerce, etc., theatre and hospitals. In the environs, on the Bay of La Concha, is the royal palace. The industries of the town have greatly developed and include saw and flour mills, breweries, manufactures of preserves, soap, candles, glass and paper, and there is considerable trade in English and French goods and in normal years, exports of wool, flour, wine, cutlery, firearms, copper-ore and lead, and imports of sugar, silk, cotton and linen goods, cocoa, machinery and salted fish. San Sebastian is an aristocratic watering place, bathing, bull-fights, gambling and local festivities attracting many visitors. Historically it has played an important rôle and has sustained several sieges, the most memorable in 1813, when Wellington took it by storm. Pop. (1910) 49,008.

SAN STEFANO, stēf'a-nō, Treaty of, a peace treaty of the Russo-Turkish war, concluded 3 March 1878, at San Stefano, a port on the Sea of Marmora. By its terms Bulgaria was to become a principality, extending from the Danube to the Ægean, and Rumania, Servia and Montenegro were recognized as independent. Russia was to receive a war indemnity of 300,000,000 rubles and the Dobrudja, Kars, Batum and other possessions. The congress held at Berlin, in June and July, 1878, greatly altered the provisions of this treaty, effecting peace on somewhat more moderate terms.

SAN VICENTE, vē-sān'tā, or **SAN VICENTE DE AUSTRIA**, Salvador, 23 miles east of the capital, lies almost central in the republic close to an extinct volcano of its own name. It is an attractive town; its handsome church is the only conspicuous building. It occupies a fertile region and the chief occupations are tobacco and indigo planting; and the manufacture of the former, and of clothes, silks, shoes, hats. The annual fair is much frequented. The town suffered from an earthquake in 1899. Pop. about 18,000.

SAN XAVIER DEL BAC, Spanish mission in Santa Cruz valley, eight miles south of Tucson, Arizona, established about 1687 by fathers Kino and Salvatieraz, Jesuit missionaries to the Indians. The present church, erected about 1727, has the form of a cross 105 feet long and 27 feet wide inside. It is built of adobe with stone foundation and covering of fine cement. It faces south with a beautiful façade in a good state of preservation, highly ornamented with scroll work adorned with the arms of the Franciscan Order. Two towers, one never finished, surmount the front. Over the main chapel is a massive dome of

splendid proportions and lightness. Several fine frescoes remain and there are many admirable and interesting architectural features and adornments. Its preservation is due to the devotion of Papago Indians who took charge when the priests were driven off by Apaches in 1827.

SANAA, sā-nā', or **SANA**, Arabia, the capital of Yemen, lies in a high and well-watered valley, 260 miles north of Aden and 140 miles northeast of Hodeida on the Red Sea. It is of great antiquity, massively built and surrounded by a wall. Each street is arranged with reference to business confined to that locality, according to Asiatic custom. The principal mosque is of recent construction, an Oriental building with fine domes and minarets. The chief manufactures are gold and silver articles, gunpowder, sword-blades, etc. Trade is in coffee — the great staple — dried fruits and raisins. Sanaa was long the capital of the independent Imams of Yemen, but in 1872 came under Turkish rule, since when its commercial importance has declined. Pop. 45,000, of whom about 20,000 are Jews.

SANATORIUM, a term used interchangeably with sanitarium, specifically a health retreat, strictly a place where the treatment is prophylactic instead of therapeutic; in a broad sense a place for rest cure.

SANBORN, sān'börn, **Alvan Francis**, American journalist: b. Marlborough, Mass., 8 July 1866. He was graduated from Amherst in 1887 and filled several journalistic positions, among them that of Paris correspondent of New York and Boston periodicals from 1899. He published 'Moody's Lodging House and Other Tenement Sketches' (1895); 'Meg McIntyre's Raffle and Other Stories' (1896); 'Paris and the Social Revolution' (1903), besides editing 'Masterpieces of Prose' (1893); 'Reminiscences of Richard Lathers' (1907), etc.

SANBORN, Franklin Benjamin, American philanthropist and author: b. Hampton Falls, N. H., 15 Dec. 1831; d. 24 Feb. 1917. He was graduated from Harvard in 1855, became active in politics as a member of the Free Soil party in New Hampshire and Massachusetts, was for a time secretary to the Massachusetts State Kansas committee, and aided John Brown in the invasion of Harper's Ferry after having vainly opposed the scheme. From 1863 to 1868 he was an editor of the Boston *Commonwealth*; in October 1863 became secretary of the Massachusetts State board of charities, the first established in America; and in 1865 assisted in the organization of the American Social Science Association, of which he was until 1897 secretary. With Bronson Alcott and W. T. Harris he founded the Concord school of philosophy in 1879; and he was also an organizer of the National Prison Association (1871), and the National conference of charities (1865). Among his publications are 'Life and Letters of John Brown' (1885); biographies of Thoreau (1882), Alcott (1883), Dr. Howe (1891), and Dr. Earle (1898); 'The Personality of Thoreau' (1902) and 'The Personality of Emerson' (1903). He was through all his active life a journalist, having begun to contribute to the New Hampshire *Independent*

Democrat in 1849, to the Boston *Transcript* in 1852, to the *Christian Register* in 1853, the Boston *Traveller* in 1856, and to the Springfield *Republican* in 1856. He was editor of the *Republican* after June 1868, furnishing from three to six columns a week. Between 1900 and 1917 he published Ellery Channing's 'Poems of 65 years' (1902); Channing's 'Thoreau the Poet-Naturalist' with additions (1903); Thoreau's 'The Service' (1902); 'Bronson Alcott at Fruitlands' (1908), and 'Hawthorne and His Friends' (1908); 'Recollections of 70 Years' (2 vols., 1909), and 'Sixty years in Concord' (1916). A final life of Thoreau, 'Thoreau and his Earliest Writings' (1916). He also edited two volumes of 'Theodore Parkers Writings' (1914), introduced Newton's 'Lincoln and Herndon' (1913), and wrote brief biographies of Dr. Langdon, president of Harvard College, of Ellery Channing and of Mrs. Abbott-Wood of Lowell. For 30 years he edited the *American Journal of Social Science*, (1867-97), and contributed largely to the Proceedings of the Massachusetts Historical Society (1903-15), and edited for the Boston Bibliophile Society five volumes of Thoreau's manuscripts, a volume of the Shelley-Payne correspondence, and one of the Fragments and Letters of T. L. Peacock.

SANBORN, John Benjamin, American military officer: b. Epsom, N. H., 5 Dec. 1826; d. 1904. He was educated at Dartmouth College, studied law, was admitted to the bar in 1854, and in that year removed to Saint Paul, Minn., where he engaged in law practice. At the outbreak of the Civil War in 1861 he was adjutant-general and quartermaster-general of Minnesota and assisted in the organization of the troops sent to the front. In 1862 he went to the front with the rank of colonel. He commanded a brigade at Iuka, was engaged at Corinth, Port Gibson, Raymond, Jackson, Champion Hills, and at the siege and assault of Vicksburg. He had been commissioned brigadier-general of volunteers in 1863, and in October 1864 took command of the district of southwest Missouri. He bore the unique record of never having been defeated in action and with the exception of the assault of Vicksburg, never failed of complete success. He conducted a campaign against the Indians in 1865, amicably adjusted the Indian difficulties the next year, and in 1867-68 was a member of the Indian Peace Commission. He served in the Minnesota legislature for several terms.

SANBORN, Katherine Abbott ('KATE SANBORN'), American author and lecturer: b. Hanover, N. H., 11 July 1839; d. 9 July 1917. She earned her first money by writing, at the age of 11, and at 17 engaged in teaching. She lectured on literary topics for 20 years, was teacher of elocution at Packer Institute, Brooklyn, and for several years occupied the chair of English literature at Smith College. She published 'Home Pictures of English Poets' (1869); 'Round Table Series of Literature Lessons' (1884); 'The Vanity and Insanity of Genius' (1885); 'Adopting an Abandoned Farm'; 'Abandoning an Adopted Farm'; 'The Wit of Women'; 'My Literary Zoo'; 'Oldtime Wall Papers' (1905); 'Hunting Indians in a Taxi Cab' (1911); a series of calendars, etc.

SANBORN, Walter Henry, American justice: b. Epsom, N. H., 19 Oct. 1845. He was graduated at Dartmouth College in 1867, studied law, and in 1870 engaged in law practice at Saint Paul, Minn. From 1892 he was United States circuit justice of the Eighth Judicial Circuit, and from 1903 he was presiding justice of the United States Circuit Court of Appeals of the Eighth District. He conducted the receiverships of the Union Pacific Railroad, 1893-98; the Chicago Great Western, 1908-09; and the Frisco Railroad, 1913-14. He also handed down important decisions in the Trans-Missouri Freight Association Case, 1893; the Standard Oil Case, 1909; and the Oklahoma Gas Case, 1911.

SANCHO, an instrument of the guitar species, made of hollowed wood and furnished with a long neck. It is strung with the tough fibres of a creeping plant, and is tuned by means of sliding rings.

SANCHO PANZA, sän'kō pän'zä (Sp. sän'chō pän'tha), the faithful squire of Don Quixote (q.v.), who accompanies his master upon his travels, but who takes a prosaic view of the incidents colored and distorted by his master's illusions. He is famous for his shrewd proverbs.

SANCHUNIATHON, sän-kū-nī'a-thōn, or **SANCHONIATHON**, alleged author of a history of Phœnicia and Egypt, entitled 'Phoinikika,' and published by Philo (q.v.) of Byblus, a grammarian of the 2d century, as a Greek translation from the Phœnician. According to Philo, Sanchuniathon was a native of Berytus, a Phœnician town near his own native place, and flourished during the reign of the Assyrian queen Semiramis. Others speak of him as a Phœnician living before the Trojan War. Some critics maintain that no such person ever existed, and that the work attributed to him was the composition of Philo himself, or, as others think, of Eusebius. A fragment of the work is preserved in Eusebius, who quoted Sanchuniathon as evidence in corroboration of certain biblical statements which Porphyry had assailed. The Greek fragments still extant were published by Orelli (1826) and by C. Müller (1849), and were the occasion of much keen controversy. The conclusion arrived at by Renan is that a Phœnician of the time of the Seleucides, whose real or feigned name was Sanchionathon, wrote in Phœnician, a work on history and mythology, and that a free translation of this was afterward made by Philo of Byblus.

SANCROFT, sāng'krōft, William, English prelate: b. Fressingfield, Suffolk, 30 Jan. 1616; d. there, 24 Nov. 1693. He was graduated from Cambridge in 1637, was appointed dean of York in 1664, took orders in the English Church, and shortly afterward became dean of Saint Paul's Cathedral. In 1678 he was consecrated archbishop of Canterbury, but in 1688 on refusing to publish the declaration of the liberty of conscience ordered by James II, was committed to the Tower for trial. He was acquitted, but after the Revolution refused to take the oath of allegiance to William and Mary, was deprived of his see, thereafter living in seclusion in his native town until his death.

SANCTI SPIRITUS, sänk'tē spē'rē-toos, Cuba, city, province of Santa Clara, 50 miles southeast of the city of Santa Clara. It was founded in 1514, being one of the seven original towns of the island established by Diego Velasquez. It is connected by a branch road with Las Tunas, on the south coast, and with the main railroad system of the island; but has little commercial importance. Its situation is unhealthy; its streets are narrow and crooked, but were improved somewhat during American occupation of Cuba, nine streets being completely remade. It contains two hospitals and a college. Pop. (1907) 36,572.

SANCTIFICATION, a theological term in the definition of which divines Protestant and Catholic differ widely. For the former, sanctification is totally distinct and separable from justification: for Catholic theologians, sanctification and justification are inseparable and hardly even in thought distinguishable one from the other. Calvin (Inst. Book 3, ch. ii) the Lutheran symbol 'Solida Declaratio' (ch. *de fide justif.* § 7), and Luther and Melancthon in many places teach that justification is simply a judicial act of God's free grace liberating the sinner from *condemnation*, while original sin still persists in man's nature and in all his powers inward and outward, to be weakened, not extirpated, by the communication of the Holy Spirit: thus sanctification is a process which begins after justification. Justification in the teaching of the Catholic Church is defined by the Council of Trent (Sess. 6, ch. vii) to be "not only remission of sins but also *sanctification* and renovation of the inner man through the free acceptance of grace and gifts"; and in another place (Sess. 6, ch. v) the Council teaches that "justification is a transference out of that state in which man is born a son of Adam, into the state of grace and adoption of the children of God, by the Second Adam, Jesus Christ, our Saviour." From which it appears that in Catholic theology sanctification is inseparable from justification, which depends upon it; and that "the sinner is justified and sanctified by the one same act"; *uno eodemque acti homo peccator justus sanctusque efficitur* (Perrone, 'Praelect Theol.,' tr. *de Gratia*, Pt. 2, ch. i).

SANCTUARY, Privilege of, the exemption of certain places and of criminals taking refuge in them from the ordinary operation of the law of arrest; called also privilege of asylum (q.v.). The six cities of refuge mentioned in the Book of Numbers xxxv, were to afford the privilege of sanctuary to "any one that killeth any person unawares." That institution in Israel and the institution of asylum among the heathen nations gave rise to the similar institution of sanctuary in Christendom. The privilege of sanctuary was accorded to certain churches in the time of Constantine; afterward, through the period of the empire, eastern and western, and throughout the Middle Ages, it was recognized as attaching to all churches. In England a person accused of felony might take refuge in a sanctuary, and then before the coroner, within 40 days, take oath of abjuration entailing perpetual banishment into a foreign Christian country. Statutes of the time of Henry VIII greatly curtailed the privilege of sanctuary, and the statute of 21 James I totally abolished it. But the privilege of sanctuary

against civil process still persisted, attaching to certain places, parts or supposed parts of royal palaces, as Whitefriars ("Alsatia"), the Savoy, and the Mint: these were secure refuges for debtors till 1697, when their privilege was abolished by the statute 8 and 9 William III. All religious sanctuaries in Scotland were done away at the Reformation; but the Abbey and Palace of Holy Rood with its precincts, including the hill of Arthur's Seat and the Queen's Park still afforded protection against civil process for debt; and the privilege still exists in form, though in fact it never has to be invoked since the abolition in 1880 of imprisonment for debt. It was the abuses to which this system gave rise, as tending to defeat the ends of justice, that led to its abolition in all Christian countries. A modern form of the system is extraterritoriality (q.v.).

SANCTUS, or **TERSANCTUS**, a passage in the liturgical service of the Catholic Church, eastern and western, and in part still retained in the Anglican Book of Common Prayer: it is the final passage of that part of the liturgy (and of the Anglican communion service) which is called the Preface. The name Sanctus or Tersanctus (thrice holy) is given to it because of the word sanctus (holy) thrice repeated, with which it opens. *Sanctus, sanctus, sanctus, Dominus Deus Sabaoth*, etc., that is, "Holy, holy, holy, Lord God of Hosts, heaven and earth are full of Thy glory. Hosanna in the highest. Blessed He that cometh in the name of the Lord. Hosanna in the highest." In the prayer book only the first clause is used, followed by "Glory be to Thee, O Lord Most High. Amen."

SAND, sänd, **George**, assumed name of LUCILE-AMANDINE-AUORE DUPIN, French novelist: b. Paris, 1 July 1804; d. Nohant, in Berry, 8 June 1876. Her father's mother was an illegitimate daughter of the noted Maurice de Saxe, son of Augustus II, king of Poland, and was herself widow of the Comte de Horn, bastard of Louis XV, when she married George Sand's grandfather, Dupin de Francueil. George Sand's aristocratic, though clouded, paternal ancestry was mated with plebeian blood, her mother being a Parisian *modiste*. She was brought up chiefly in the country at her grandmother's home in Nohant, but was partly educated at the Couvent des Anglaises in Paris. Her youth was dreamy and emotional. At 18 she was married to the Baron Casimir Dudevant, but the marriage proved unhappy, and resulted, after some years, in a separation. In 1831 she began a Bohemian career in Paris, associating with young literary men and students and herself often wearing masculine costume. The first important one of her many *liaisons*, so often with younger men, was with Jules Sandeau. They wrote at first under the name of Jules Sand, but soon she composed her own novels, signing them George Sand. Her first independent book was 'Indiana' (1832). George Sand's extraordinarily numerous novels are usually divided into four chronological groups. The earliest ones, in particular, which reflect her emotional discipleship of Rousseau and of the Madame de Staël of 'Delphine' and of 'Corinne,' as well as her own domestic infelicities, aroused a storm of criticism. Her hostility to accepted social con-

ventions, her attacks on the tyranny of marriage, her portrayal of the misunderstood and unappreciated woman or *femme incomprise*, aroused the tumult of indignation which greeted 'Valentine,' 'Lélia' and 'Jacques' as expressions of over-emancipated feminism. In 1833, before the appearance of 'Jacques,' began the madly romantic love-affair with Alfred de Musset, six years her junior, and already a noted poet. Together they went to Italy, but within a few weeks, by the time of their arrival in Venice, dissension had begun. This was accentuated by the successive illnesses of George Sand and of Musset and his jealousy of the handsome young Italian doctor, Pietro Pagello, who was called in to treat him. Musset tried first a rôle of magnanimous forgiveness and returned to France, leaving George Sand with Pagello. She, however, soon repented of the change and, after stormy efforts at a renewal of the old intimacy, the final break between George Sand and Musset came in 1835. As a result of romantic literary "exhibitionism" this affair was the source of much material, Musset's 'Confession d'un enfant du siècle' and many of his finest poems, George Sand's 'Elle et lui,' not to mention documents by relatives or partisans of one or the other principal. Roughly speaking, George Sand's second literary period now begins. She discards somewhat the portrayal in her novels of beautiful men and women with obstreperous souls, and comes under the influence of people like the musician Chopin, or advocates of social reform and humanitarianism such as Michel (de Bourges), Lamennais and Pierre Leroux. Down to about the middle of the 19th century her novels, while still touched with romantic passion, tend to present in sentimental and somewhat fantastic fiction plans for the reconstruction of society and mating of classes, or visions of a world happily organized in justice and sympathy. 'Mauprat' has the excellence of a well-told story, but more characteristic works of this period are 'Spiridion,' 'Les Sept cordes de la lyre,' 'Consuelo,' 'La Comtesse de Rudolstadt,' 'Le Meunier d'Augibault' and 'Le Péché de monsieur Antoine.' In 1838-39 she made a journey to Majorca with the consumptive Chopin, a trip commemorated in 'Un hiver à Majorque.' The intimacy continued for several years longer and Chopin appears in disguise in 'Lucrezia Floriani.' At the beginning of the republic of 1848, George Sand greeted the new régime with joy, wrote 'Lettres au peuple,' collaborated with Ledru-Rollin, but soon became disheartened at popular excesses and ceased her political propaganda. Meanwhile she had gradually turned to the composition of novels of a third category. As early as 1844 in 'Jeanne' she had tried to combine the mystical spirit with a story of rustic life; then devoting herself to the idealized portrayal of the country, especially of her own province, she composed the pastoral idylls which are her works most read to-day 'La mare au diable,' 'La petite Fadette,' 'François le champi,' 'Les maîtres sonneurs.' 'Les beaux messieurs de Bois-Doré' is an incursion into the literary pastoral under the influence of Honoré d'Urfé's 'Astrée.' Finally, during the last period, beginning about 1860, she wrote sentimental stories, but of a more conventional character and free from the impractical utopianism

or even impossible fantasy which had characterized many of her earlier works. To this class belong 'Jean de la Roche' and 'Le Marquis de Villemer.' This last work won even greater success when dramatized with the help of the younger Dumas who gave it a wit and vigor which the diffuseness of George Sand herself could never achieve. Her style was, indeed, extremely diffuse. Her facility of composition was extraordinary and her plots came as she put pen to paper. She could write or stop writing at any hour of the day or night. Thus we can understand the abundance of her works, of which only a few can here be mentioned. Her influence has passed away, and she has long ceased to be thought of as revolutionary, but her books will always be remembered as both the reflection and inspiration of utopian visions of her age, and her intimacies with so many famous men give an interest to her in addition to her own merits. Her 'Histoire de ma vie' of 1855 is of interest in this respect and of much psychological value. See *ELLE ET LUI*.

Bibliography.—George Sand's collected works were issued as 'Romans et nouvelles' (84 vols.); 'Mémoires, Souvenirs, Impressions, Voyages' (8 vols.); 'Théâtre' (4 vols.); 'Théâtre' de Nohant' (1 vol., Paris 1862-83). A uniform edition of her writings was issued in America (20 vols., Philadelphia 1901). For the incident of the Venetian doctor, Pagello, consult Cabanès, 'Cabinet secret de l'histoire' (Paris 1897), and Maurras, C., 'Les amants de Venise' (ib. 1904). Consult also Caro, E. M., 'A Life and Study of George Sand' (London 1888); Buis, Lucien, 'Les théories sociales de George Sand' (Paris 1910); Doumic, René, 'George Sand: Some Aspects of Her Life and Work' (English trans. by Alys Hallard, New York 1910); Karénine, W., 'Life of George Sand' (3 vols., 1899-1912).

CHARLES H. C. WRIGHT,
Professor of French Language and Literature,
Harvard University.

SAND, a mass of unconsolidated mineral grains of practically uniform size, large enough to be detected with the unaided eye, but too small for the grains to be readily picked up by hand. In composition sand varies greatly, from grains of pure silica or pure calcium carbonate to a complex mixture of many minerals. Pure silicious sand is in most cases primarily derived from the disintegration of igneous or other rocks, containing silica, which remains behind after the removal of other minerals more subject to chemical disintegration. The separation is usually accomplished by the waves of the seashore, and in general it may be said that the longer the sands are subject to wave activity the more complete will be the sorting process. Calcareous sands result mostly from the grinding up by the waves of shells, corals, etc., or of limestone beds; and may be of all degrees of purity. The so-called eolian limestone of the Bermudas consists of calcareous shell sand which has drifted into great dunes, and later been consolidated. Drifting dunes of gypsum are known in New Mexico. Granite, when broken down by mechanical agencies, forms a quartz-feldspar sand known as feldspathic sand, or arkose sand. Basic rocks, similarly disintegrated, form ferro-magnesian or gray wacke

sand. On the shore, the sands are kept firm by the water held between the grains by capillary attraction. If this evaporates, the sands are driven inland by the winds, piled up into sand-dunes and often convert extensive districts into sand-deserts. (See *DESERT*). River sands derived from crystalline or metamorphic rocks often carry gold or other precious metals in the forms of grains or nuggets. Auriferous sand constitutes the source of much gold, in placer deposits. Sands washed by temporary streams from glaciers or glacial moraines and deposited in front of the ice, build up sand-plains, which are the chief source of sands and gravels in glaciated regions. (See *GLACIAL DEPOSITS*). The ordinary grades of sand are much used in the building trades for mortar and concrete; very pure quartz sand is largely used in glass manufacture; and various other grades of sand are employed for a very large number of purposes. See *MINERAL PRODUCTION OF THE UNITED STATES*.

SAND, Musical. See *MUSICAL SAND*.

SAND-BADGER, or **HOG-BADGER**, a small East Indian badger (*Arctonyx collaris*), which gets its first name from its customary station and burrowing habits, and the second from its pig-like rooting snout. Another frequently heard name is "balisaur." It frequents stony ground and occupies natural crevices and dens when these are handy, but elsewhere digs rapidly and deeply burrows in which it spends its days for the most part, waiting until night to go abroad in search of its small prey. Its general habits are like those of its type. See *BADGER*.

SAND-BLAST, an invention for the use of sand as a blast in cutting and engraving glass, stone, metals, etc. The sand is blown against the article to be cut by a blast of air or steam, which quickly cuts away the unprotected surface, leaving in relief that part of the surface guarded from the effect of the sand by patterns of iron or other substance harder than that which it is desired to efface. The sand-blast attracted much attention when first introduced, and it has been used largely in the preparation of soldier's tombstones, and other large contracts of a similar character.

SAND-BUR, either of two very dissimilar plants. One, also called the buffalo-bur (*Solanum rostratum*), is a weed, native to the western plains of the United States; it is the original food of the potato-bug, and is working eastward, its seeds having traveled at first, perhaps, in the coats of the bison. It has even crossed to Europe, by some means. The sand-bur is an annual, densely pubescent and prickly-armed plant, having the characteristic star-shaped flowers of the potato, although yellow in hue. The calyx is densely prickly, and surrounds the berry in fruit, the prickles becoming as long as the berry itself. Sand-bur seeds occur among fodder-seeds grown in the West, but careful cultivation will subdue this weed. The plant is light and bushy, and is blown over the prairies as a tumble weed.

A grass (*Enchurus tribuloides*) is also called "sand-bur," and is commonly found near seashores or in waste land, in the eastern half of the United States, where it is becoming a noxious weed in some places. It has robust stems,

partly decumbent from an annual root, and branches freely. The leaves are flat, and the floral involucre is crowded in terminal spikes on a rough stem, and form spiny burs, which stick easily to clothing or the hair of animals, and so may be carried long distances.

SAND-CAKE, or **SAND-DOLLAR**, a name along the New England coast for one of the flat, dollar-shaped, villose sea-urchins of the genus *Echinarachnius*; several species are to be found on sandy bottom near shore and others are numerous in greater depths, affording some food to cod, flounders and other bottom-feeding fishes. See **CAKE-URCHIN**.

SAND-CRACK, a crack or fissure in the hoof of a horse, due to a disease generally referred to the coronet, sometimes to the laminae covering the pedal bone, specifically to the membrane which secretes an essential adhesive substance entering into the constitution of the hoof. The crack generally extends from the coronet toward the sole. In the fore feet the inner quarters are most frequently attacked; in the hind feet, the toes. There are various forms of sand-crack, the most common of them being usually called quarter-crack. See **HOOF**.

SAND CREEK MASSACRE, a sanguinary attack by Colonel Chivington on 29 Nov. 1864, on a Cheyenne and Arapaho camp in Kiowa County, Colo. The Indian Commissioner had sent about 400 Indians of the tribes above named to a camp at Sand Creek. The military desired to cow the Indians by heavy punishment for their atrocities against the whites, while the Indian Department earnestly sought to mediate between the white settlers, the military and the aborigines. Chivington slaughtered 131 men, women and children, and a long and costly struggle ensued. Not until 1871 did the Cheyenne put aside the sword and consent to go on a reservation.

SAND-DARTER, a genus (*Ammocrypta*) of small fresh-water fishes (see **DARTER**), whose species, especially *A. pellucida*, common in the mid-continent streams, buries itself in the sandy bottom with astonishing quickness and completeness.

SAND DUNE. See **DUNE**.

SAND-GROUSE, a family (*Pteroclidæ*) of birds related, on the one hand, to the pigeons (*Columbæ*), and, on the other, to the grouse (*Gallinæ*). The sand-grouse inhabit the plains and sandy deserts of the tropical regions and countries of the eastern hemisphere. The legs are longer than in grouse, the tail and wings pointed and the general aspect dove-like. The best-known species are the *Pterocles alchata* and the *P. arenaria*. Both of these birds occur in southern Europe. They fly well and feed upon seeds and insects. The eggs are four or five in number and the nest is constructed in a rough fashion on the ground. Other species inhabit Asia and Africa. Pallas' sand-grouse has been made the type of a different genus, *Syrrhaptes*, in which the tarsi are feathered and the anterior toes united in a common integument, as well as feathered to the claws, the hallux absent. It is a native of the plains of central Asia, where it occurs in vast numbers. Much interest was excited in 1863 and again in 1888 by great numbers of these birds invading Europe. They crossed the North Sea and were

found in considerable numbers throughout Britain, and as far north as the Faroes. They even bred in Great Britain in one or two cases. Smaller invasions occurred in other years. Sand-grouse are classed as game-birds in the regions in which they occur and especially in India.

SAND-HILL CRANE. See **CRANE**.

SAND-HOPPER. See **AMPHIPODA**.

SAND-LAUNCE, or **SAND-EEL**, a small teleost fish of the family *Ammodytidae*, which is represented on all the colder coasts of the world by some 10 species, but whose relationships are undetermined. They have the shape of eels, from 6 to 12 inches long, according to species, but are distinguished by the fact that the tail-fin is well developed and is distinct from the dorsal and anal fins, while it is also forked at its extremity. The skin is silvery in appearance, but destitute of true scales. The lateral line runs along the side of the back. The dorsal fin begins just behind the head and extends nearly to the caudal fin. The anal fin extends to about one-third or one-half the length of the body. Several species are to be found on both coasts of North America.

SAND-MARTIN. See **BANK-SWALLOW**.

SAND-PAPER, an abrading agent made by coating paper or thin cotton cloth with glue and dusting fine sand over it with a sieve. Sand-paper is intermediate between glass paper and emery paper in its action on metals, but is less energetic than glass paper in its action on wood.

SAND-PIKE, a fish, the sauger (q.v.).

SAND PIPE, cylindrical hollows, often of great depth and filled with sand and gravel. They are characteristic of all rocks, but have been particularly described from the white chalk of England and France, where Lyell has found them up to 12 feet in diameter and over 60 feet deep. They are analogous to pot-holes formed along mountain streams through the gyrating motion of the water in an eddy. The holes are cut by loose rocks kept in constant circular motion by the water. Analogous hollows, termed glacial pot-holes or moulins, are also found where a superglacial or englacial stream plunges down a crevasse and sets the rocks at the bottom of the crevasse in motion, thus often cutting to great depths. These holes or pipes are afterward filled with sand and gravel either by the stream or upon the melting of the ice. These holes have also been attributed by Lyell to the chemical action of water charged with carbonic acid gas, which was derived from the decaying vegetation of the soil through which the water passed.

Similar deposits of sand, generally solidified into sandstones or quartzites, are not infrequently found in the older rocks of all countries. These are generally masses in the form of dikes penetrating sedimentary or crystalline rocks, often to a great depth. Many of these sandstone dikes were formed at a very early period in the earth's history, when the fissures were formed either through solution, atmospheric disintegration or in some cases through earthquake shocks.

SAND-SHARK, a small voracious shark of the family *Carchariidae*, which is mainly ex-

tinct, the three existing species occurring chiefly in the Atlantic, where *Carcharias lit-toralis* (J. and E.) occurs numerously on the American coast between Cape Cod and Cape Hatteras; it is doubtfully different from the one frequently seen along the European coast. These sharks are similar to the mackerel sharks (*Lanuridae*) and reach a length of five or six feet.

SAND-SUCKER, a local name in California for a familiar fish, the whiting (q.v.).

SAND-WASP, any of many solitary wasps which burrow in sand or loose earth and leave their eggs there in well-provisioned cells. There are numerous species in all parts of the world. See WASP.

SAND WHEEL. The removal of fine waste, sand and slime from mills where ores are crushed and concentrated may call for the use of special devices, one of which is the sand wheel. If the mill stands on a hillside such refuse can usually be washed down troughs, called launders, to lower ground where it may accumulate. If the mill site is level land and the mill handles a large amount of rock then the refuse must be lifted that it may flow to a settling place. Various types of elevators and conveyors are used for this purpose. The sand wheel, though bulky, has the merits of simplicity and few wearing parts, and is simply a development of the water wheels used since ancient times for irrigation purposes in Eastern countries. At ore mills in many parts of the world sand wheels may be seen, notably at the great gold mines of the Transvaal, where are some over 50 feet in diameter.

A giant sand wheel, one of the largest ever erected, handles the mingled sand and water from the great crushing and concentrating plant of the Calumet and Hecla Mining Company at Lake Linden, Mich. This mill treats an enormous tonnage of copper-bearing rock and the resulting waste is run into the lake where the accumulations of years cover many acres. The large wheel was erected that the waste might be lifted higher to flow over the old deposits. It is 65 feet in diameter, elevates the water and waste to a height of 50 feet and has a capacity of 75,000,000 gallons in 24 hours.

It was constructed by the Robert Pool and Son Company of Baltimore, Md. In the general principles of design involved the wheel does not differ materially from other segmental iron and steel wheels of large diameter, but is of interest from its size. The axle, a hollow cylinder made of Krupp's crucible cast steel, was forged at Essen, Germany, but finished at Baltimore; it is 27 feet long, 32 inches in diameter at the middle and has a 16-inch hole through the centre. This axle weighs 42,000 pounds.

The axle journals are 25 inches in diameter and 42 inches long. Fitted to either end of the axle is a massive gun-iron hub, weighing 20,000 pounds, and from these hubs radiate 40 four-inch steel rods or spokes to the inner face of the rim. The inner end of each spoke is fitted with a thread, nut and lock-nut by which the requisite tension is given for securing and truing the rim. The outer end of each rod is turned into an eye and fastened to a steel flange on the rim by an eyebolt. The rim is built up in 20 segments. It consists of two concentric

rings, an inner or main ring of box-shaped cross section to which the spokes are attached, and an outer or toothed ring fastened through inwardly projecting flanges to the inner rim by bolts and keys. On the periphery of this outer rim are gear teeth, accurately milled in two rows, staggered. Each row of teeth is 12 inches wide, making the effective width 24 inches. And there are 26 teeth in each segment or 520 in all.

To each side of the sectional rim is riveted a triangular plate iron box, carrying on its inner side 275 buckets, making 550 in all, each bucket measuring 4 feet 3½ inches, by 3 feet 4 inches. The wheel makes about four revolutions per minute and the peripheral speed of the buckets is about 12 feet per second, but the buckets are set at such an angle that the peripheral speed prevents their discharge till they are near the top of the wheel. The tangential strains due to the loads of sand in the buckets are taken up by a system of tangent tie-rods which extend from the lugs, already referred to, on the rim, to the periphery of a tangent hub which is keyed to the centre of the axle, between the two outer hubs. These tie-rods are arranged in pairs and in opposite directions so that, although the load at the periphery may exert either a right-handed or a left-handed strain, no transverse bending strain is brought upon the main spokes of the wheel. The tension of the tangential tie-rods is adjusted by means of turnbuckles placed at the centre of each rod. The wheel, with buckets attached, is nearly 12 feet wide across the face. It is driven by an electric motor of 750 horse power through a pinion wheel 37 inches in diameter having a shaft carrying a wheel that engages a pinion on the motor shaft. The wheel dips into a pit 100 feet long, 12 feet wide and 30 feet deep that receives the sand and water. From this pit the refuse is scooped up and discharged into a launder at an elevation of about 50 feet. For protection against the elements, the winter climate being severe, the wheel is housed in a building high enough to cover it entirely.

SANDAL, a kind of covering for the feet used among the ancient Jews, Greeks and Romans and which we find to be of the highest antiquity. It usually consisted of leather or of a thick cork sole covered above and beneath with leather and neatly stitched on the edge. It left the upper part of the foot bare and was fastened on by means of straps, crossed over and wound round the ankle. In later times sandals became articles of much luxury, being made of gold, silver or other precious material and beautifully ornamented. See BOOTS AND SHOES.

SANDAL-WOOD, a fragrant wood furnished by the genera *Santalum* and *Fusanus*, of the family *Santalaceæ*. The principal source of the genuine sandal-wood is a small evergreen tree (*Santalum album*), partly parasitic in growth, with opposite entire leaves and thyrses of yellowish flowers which resemble those of the privet. It grows wild and is now also cultivated in the dry regions of southern India and on the mountains of the Malay Archipelago.

The trees are mature in about 20 years and are then cut down, the trunk being then about a foot in diameter. The felled trunks are left on the ground in order that the white ants may eat off the useless sapwood, the insects

GIANT SAND WHEEL FOR THE CALUMET AND HECLA MINING COMPANY

Diameter, 65 feet; Weight, 50 tons; Number of buckets, 550

leaving the aromatic heart wood untouched. When thus cleaned the sandal-wood is sawn into small pieces and then dried slowly to improve the fragrance and to prevent splitting. This heart wood is yellowish-brown, very hard and close-grained and made odorous by the presence of an oil, which is still more abundant in the root. The oil is distilled from the roots and chips and is largely used as a perfume, especially in India, and also as a medicine; it is said to have replaced copaiba in the treatment of diseases of the mucous membrane. The heart wood is used especially by the Chinese for carvings, fans, boxes, etc., not only because of its lasting perfume, but because it repels insects; it was employed in India during the 5th century at least and is still a necessary article in various Buddhistic ceremonies, in cremations, for caste marks and for incense. It was probably one of the ingredients of the Levitical incense and the almug of Scripture. Sandal-wood was originally obtained only in India, but other species (*S. freycinetianum* and *S. pyralium*) were found in Hawaii and in other Pacific islands and led to a trade so high-handed that many deaths ensued and the supply of trees was nearly exhausted.

A small leguminous tree (*Pterocarpus santalinus*) furnishes the red sandal- or sanders-wood, having a heart wood, first dark-red, but becoming brownish on exposure, and used as a dyestuff, giving reddish-brown hues to woollens. Powdered it was employed to color foods and was considered by Hindu physicians to be astringent and tonic. Various inferior qualities of sandal-wood are obtained from *Bucida capitata*, the *Myoporaceæ* and other trees.

SANDARACH, a friable, dry, almost transparent resin, which is imported from Morocco, in pale yellow tears, somewhat harder than mastic. It exudes from the bark of the small coniferous sandarach-tree, also called the tear tree (*Callitris quadrivalvis*), a native of the north of Africa and a characteristic tree of the Atlas Mountains. The Australian species of *Callitris* furnish a similar resin. Sandarach is not used in great quantity. Although a medicine in high repute at one time and later used for a pounce-powder, to prevent ink from spreading when writing over an erasure, its chief employment now is in the making of varnishes, the same as mastic. The mahogany-colored wood of the sandarach tree is highly balsamic, extremely durable and is utilized by cabinet-makers and mosque-builders; it is said to have brought fabulous prices in Pliny's time.

SANDAY, William, English Biblical scholar: b. Holme-Pierrepont, Nottinghamshire, 1 Aug. 1843. He was educated at Oxford, took orders in the Anglican Church and has been Lady Margaret professor of divinity and canon of Christ Church, Oxford, from 1895. He is the author of 'The Authorship and Historical Characters of the Fourth Gospel' (1872); 'The Gospels in the 2d Century' (1876); 'Inspiration' (1893-96); 'The Catholic Movement and the Archbishops' Decision' (1899), etc.

SANDBAGS, in fortification and other military operations, are coarse canvas bags, about 30 inches long and 15 inches thick, filled with sand, and much used in cases where cover for troops is required to be speedily obtained.

SANDBURG, Carl, American author: b. Galesburg, Ill., 6 Jan. 1878. In 1898-1902 he studied at Lombard College, Galesburg, and in 1910-12 was secretary to the mayor of Milwaukee, Wis. He became associate editor of *System Magazine* in 1913 and was also editorial writer on the *Chicago Daily News*. Mr. Sandburg was awarded the Levinson prize in the *Poetry Magazine* in 1914. He served in Company C, 6th Illinois Volunteers, in 1898 and saw active service in Porto Rico. In 1918 he was a member of the editorial board of the National Labor Defense Council.

SANDBY, Paul, English painter: b. Nottingham, 1725; d. London, 9 Nov. 1809. He was one of the earliest painters in water colors in England, and has been styled "the father of the water color school," but began life as a teacher of boys and only resolved on an artistic career after his appointment to the staff of the military drawing department of the Tower of London (1741). In 1747 he was draughtsman for the government survey of the Highlands of Scotland, which gave him a good opportunity for sketching to scenery. In 1752 he made 70 drawings of Windsor Castle and Eton, and afterward accompanied Sir Joseph Banks on a tour of Wales. In 1768 he was appointed drawing-master at Woolwich Academy, and became one of the most fashionable art teachers of his day. His 'Views of the Encampment in the Parks' (1780) illustrate his style. He outlined his subjects with a pen and then washed them in with colors in a very simple and direct way. His best works are those in body colors, which are tinted with richness, depth and refinement and are not conventionalized by the bold pen outline. As a caricaturist, he is known by his ridicule of Hogarth's 'Line of Beauty,' and his caricature portraits, such as those of 'Lords North and Thurlow.' He was a member of the Incorporated Society of Artists, and one of the original members of the Royal Academy, founded 1768.

SANDEMAN, sán'de-man, Robert, Scottish religious leader: b. Perth, Scotland, 1723; d. Danbury, Conn., 1771. He studied at Edinburgh and afterward engaged in the linen trade. On marrying the daughter of the Rev. John Glass (founder of the Glassites), he adopted his pastor's views in opposition to all church establishments and became an elder in his congregation. He soon after published a series of letters, in which he endeavors to show that a justifying faith means nothing more than a simple assent to the divine mission of Christ. Sandeman went to London in 1760 and managed to gather together a congregation of his own followers, who were called Sandemanians. The Glassites or Sandemanians number at present less than 2,000 throughout the world. In 1764 Sandeman accepted an invitation to New England, and became the author of some theological tracts, letters, discourses, etc., besides his 'Letters on Theron and Aspasio.' The Sandemanians revived the love-feast (to take place in each other's houses); the kiss of peace; the support of the poor members by the community; washing each other's feet; community of goods; they maintained the unlawfulness of saving money, etc. They still have a slender following at Danbury, Conn. The most noted personage professing the Sandemanian faith

was the great scientist, Michael Faraday (q.v.), who lived and died in that communion.

SANDEMANIANS. See SANDEMAN, ROBERT; RELIGIOUS SECTS.

SANDERLING, a sandpiper (*Calidris arenaria*), peculiar in lacking the hind toe. This bird averages seven to eight inches in length, and is colored in winter, gray on the upper and white on the under parts; the spring plumage differs in exhibiting reddish tints, marked with black. It is nearly cosmopolitan, breeding in the Arctic regions of both hemispheres, and migrating to the southern parts of South America and Africa, though many winter in the Southern States. The food consists of worms, crustacea, etc. These birds chiefly inhabit the sandy tracts of the sea-beach, and the estuaries of rivers, but are common about large bodies of water in the interior also, and associate with other species. The flesh is nutritious and pleasant to the taste, and the bird is a favorite with gunners in quest of shore-birds.

SANDERS, sän'dërz, **Frank Knight**, American Biblical scholar: b. Batticotta, Jaffna, Ceylon, 5 June 1861. He was graduated from Ripon College, Wisconsin, in 1882, was instructor at Jaffna College, 1882-86, and studied Semitic languages at Yale 1886-87. He was Woolsey professor of Biblical literature at Yale 1893-1901; held the chair of Biblical history and archæology and became dean of Yale Divinity School, 1901-05; was secretary of the Congregational Sunday School and Publication Society 1905-08; president of Washburn College, Kansas, 1908-14; and from 1914 director of the Board of Missionary Preparation. He has published with C. F. Kent 'The Messages of the Bible' (12 vols., 1897-1912) and is author of 'The Teachers' Life of Christ' (1907); 'Studies in the Life of Paul' (1908); 'The Messages of the Sages' (1915); 'History of the Hebrews' (1914), etc.

SANDERS, Henry Arthur, American classical scholar: b. Livermore, Me., 1868. He was educated at the universities of Michigan, Berlin and Munich. He was connected with the faculty of the University of Michigan in 1893-95, and continuously after 1899, becoming professor of Latin there in 1911. In 1915-16 he was on leave of absence and served as acting director of the School of Classical Studies of the American Academy at Rome, Italy. He is a contributor to various philological, archæological and educational journals; edited 'Roman History and Mythology' (1910); and is author of 'Roman Historical Scenes and Institutions' (1904); 'The New Testament Manuscript in the Freer Collection' (1912); 'The Old Testament Manuscript in the Freer Collection' (1917); 'Washington Manuscript of the Psalms' (1917), etc.

SANDERS, Liman von, German general and field-marshal: b. (?). "Liman Pasha" was sent to Turkey in 1913 as head of a military mission to reorganize the Turkish army, assisted by Marshal von der Goltz. In May 1914 he issued from Constantinople sealed orders for mobilization to be delivered to every mayor and village president, and to be opened only on telegraphic notice from the war office. These orders were unsealed on 3 August. Early in 1915 he is said to have been the chief instru-

ment in hindering the actions of the Turkish peace party's plans. He personally conducted the defense of the Dardanelles against the powerful attacks of the British navy and army, establishing his headquarters at Gallipoli, the centre of the fighting. He informed American war correspondents in October 1914 of the practical impossibility of the capture of the Gallipoli peninsula with its impregnable fortifications, which had been the work of the British covering a number of years. He was succeeded in August 1915 by the Grand Duke of Mecklenburg and was made commander-in-chief of the Turkish forces on the Caucasian front. At the British investment of Jerusalem he forsook the Turkish army and returned to Constantinople in September 1917. When the Entente and associated powers concluded an armistice with Turkey in 1918 Liman von Sanders was arrested in Constantinople and remained under detention there until August 1919 when he was repatriated.

SANDERS' RAID INTO EAST TENNESSEE. On 14 June 1863 Col. W. P. Sanders, with 1,500 mounted men and two guns, left Mount Vernon, Ky., to destroy the East Tennessee and Virginia Railroad. Crossing the Cumberland River he surprised a body of 400 Confederates at Montgomery, Tenn., on the 17th, capturing 105 officers and men and a large amount of supplies. Avoiding the Confederates at points on the way, he struck the railroad at Lenoir on the morning of the 19th, captured three guns and about 65 prisoners, burned the depot and other buildings, containing five guns, 2,500 stand of small arms and ammunition, and then destroyed the railroad to within a short distance of Knoxville. Leaving a regiment south of the city to demonstrate on it, Sanders, with the rest of the command, passed around the place during the night, struck the railroad north of it, burned the bridges and on the morning of the 20th made a strong demonstration on Knoxville by the Tazewell road. Artillery firing and skirmishing continued an hour, during which Sanders captured two guns, 30 prisoners and some horses, and then followed the railroad to Strawberry Plains, destroying all bridges, including one over the Holston 1,600 feet long, near which, after a sharp engagement with the bridge-guard, he took 140 prisoners, five guns and a train of cars loaded with supplies. At daylight 21 June he started up the railroad for the Mossy Creek bridge, destroying the road at several points, and also the bridge. Large quantities of stores and 120 prisoners were captured. He now left the railroad to return by Rogers' Gap, avoiding forces sent to intercept him. The gap was found blocked by fallen timber and guarded by infantry and artillery, and adjoining gaps were found similarly obstructed. With the enemy in his front and closing on his rear, he found but one way to escape, and that by a trail impassable for artillery. He abandoned his guns, after destroying them and their ammunition, and by a wood road moved through Smith's Gap, three miles from Rogers', driving a cavalry regiment from it, and after a hard march in the Cumberland Mountains, in which some of his men took wrong roads, he reached Boston, Ky., on the 23d with a loss during his raid of two killed, four wounded and 13 missing. He had captured 10

guns and 10,000 small arms and paroled 461 prisoners. Consult 'Official Records' (Vol. XXIII).

SANDERSON, John, American author: b. near Carlisle, Pa., 1783; d. Philadelphia, 5 April 1844. He was professor of Latin and Greek in the Philadelphia High School from 1836 until his death. With his brother he was author of 'Biography of the Signers of the Declaration of Independence' (Vols. I-II, 1820), and was sole author of 'Sketches of Paris' (1838; London ed., 'The Americans in Paris,' 1838).

SANDERSVILLE, Ga., city, capital of Washington County, on the South Carolina and Georgia Railroad, 120 miles northwest of Savannah. It is situated between the Oconee and Ogeechee rivers, in a fertile cotton region, and has a considerable export trade in cotton. It has a high school for colored pupils established in 1890. Pop. 2,641.

SANDFORD, Frank W., American religious leader: b. Bowdoin, Me., 1862. He was educated at Bates College and at Cobb Divinity School, Lewiston, Me., and entered the ministry of the Free Baptist Church. In 1893, after some years as a pastor, he made the announcement at the convention of his denomination that he had received divine revelations. He thereupon left the Free Baptists and founded a sect known as the Holy Ghost and Us Society, a communistic organization at Durham, Me. Members are required to turn all their property over to the society, and all legal titles are vested in Sandford, the leader of the community. There are about 300 members. Their belief includes miraculous healing, the literal interpretation of the Apocalypse, Daniel and the judgment pictures in the Synoptic Gospels and the near approach of the end of the world. They insist upon baptism by immersion under their own rites.

SANDFORD AND MERTON, The History of, a famous book intended for juvenile reading by Thomas Day, published 1783-89. Portraying English social ideas of more than 100 years ago, it is now regarded as a literary curiosity. It is named for two school boys whose adventures are related in sedate fashion. Morals are drawn from every incident of their daily lives and from the stories which they read in their lesson books. Not the least remarkable feature of the book is the polished language used by these children of six years of age, which was typical of the refinement advanced English culture of the period sought to instil in youth.

SANDPIPERS, small limicoline birds of the family *Scolopacidae*, but not clearly distinguished, either in ornithology or in common practice, from the snipes (q.v.), although attempts have been made to erect them into one or more sub-families, *Tringinae*, etc. Most of the group collect about the typical genus *Tringa*, and as a whole the sandpipers may be said to be intermediate between the snipes and the plovers. The bill is snipe-like in its form and sensitiveness, but is much shorter, while the legs are generally longer than in the true snipes, and the tail-feathers are not cross-barred, and sandpipers are further distinguished from the snipes and allies by the well-marked

seasonal changes of the plumage. From the plover the sandpipers may be at once known by the straight and slender bill and by the possession of a well-developed hind toe, with the single exception of the sanderling (q.v.), as well as by numerous other characters. The true sandpipers are all birds of small and some of diminutive size. Like most of the plovers they are, with few exceptions, gregarious and frequent the shores of sea, lake and river in large flocks, but they differ from the plovers and resemble the snipes in their mode of procuring food; they probe the soft mud with their slender sensitive bills and extract from it various kinds of worms, crustaceans and larvæ. Most of the species breed in the north and perform extensive migrations. The simple nests are built on the ground and the eggs are almost invariably four and of a strong marked pyriform shape well adapted to prevent them from rolling away. The young are fully covered with down and are active as soon as freed from the egg shell. Very nearly all of the sandpipers belong to the northern hemisphere during the breeding season, and as they are especially prone to wander during the migrations, a large proportion of the Old World species have occurred as more or less regular stragglers in North America. Our fauna includes about 25 species exclusive of the related phalaropes, willets, godwits, tattlers and curlews (qq.v.), all of which, except the last, are by some writers comprised within the sandpiper group.

Some of the species are treated in other parts of this work under the names knot, dunlin, robin-snipe, sanderling, etc. Among other important species are the stilt sandpiper (*Himantopus mexicanus*), which might well be classed as a snipe because of the length of the bill, which is often distinctly curved. The legs are unusually long and small webs occur between the bases of the front toes. This species is about nine inches long and the plumage is much mottled, black, white, tawny and reddish, with a general dark effect in the breeding season; but during the fall and winter grayish and ashy from the absence of black and reddish. The stilt breeds on the shores of Franklin and Hudson bays and appears in the United States in July and August, but, except in Florida, is rare. It winters as far south as Argentina. The purple-sandpiper (*Tringa maritima*) has the short legs unusually well feathered and the front toes unusually long and margined, the hind toe very short. In its winter dress the plumage is characterized by the distinctly purple gloss of the dark upper parts, the lower being chiefly white. It is a circumpolar species and breeds in the far North, in Iceland, Greenland, Nova Zembla and beyond and may even winter in Arctic regions. It seldom enters the United States until December and ordinarily winters in the New England and Middle States, seeking rocky sea-shores in small parties. A few also occur about the Great Lakes and the species is nowhere abundant. A closely related species is the pectoral sandpiper (*T. maculata*), the jack-snipe, grass-snipe or krierer of gunners, the last name in imitation of its call. It is about nine inches long and is readily distinguished from the last by the deeper grooving of the bill, the naked lower half of the tibial portion of the leg and the thickly streaked breast; and from simi-

larly colored species by its large size. This species is abundant along the Atlantic Coast during August and September when the old birds, accompanied by the young of the year, are journeying from their arctic summer home to the pampas of Argentina and Patagonia. In habits this is more a snipe than a sandpiper, as it frequents the salt meadows and grassy margins of pools and seldom flocks on the sand beaches or associates with related species, though often found in the company of plovers. The spring flight northward follows the Mississippi Valley and few are found at this season along the sea-shore. The male is larger than the female and has remarkable courting habits. As he struts and crosses in front of the female his oesophagus is inflated like that of a pouter pigeon, and at the same time a deep resonant note is produced. The least sandpiper (*T. minutilla*) is in form and color an almost exact miniature of the last, being not over six inches long and the smallest of the group. It is also known as the stint or peep and is a typical sandpiper, breeding in British America and frequenting the sea-shore in large flocks along with other species in April and May and in augmented numbers again in August and September. It is, however, found inland, as well, in suitable localities throughout North America and spends the winter from our southern borders to Patagonia. A constant associate of the least sandpiper, which it resembles in distribution, habits and appearance so closely that the two are frequently confounded, is the semi-palmated sandpiper (*Ereunetes pusillus*). It may, however, be easily separated by the well-marked webbing between the front toes. Passing over the godwits, willets and yellowlegs, which form a somewhat distinct group of large species, the well-known and much appreciated Bartramian sandpiper, upland plover or grass plover (*Bartramia longicauda*) next requires notice. This species is about one foot long and approaches the tattlers in the cross-barred tail-feathers and unusually long gape which extends below the eye, while the tail is remarkably long and the grooving of the bill is absent from the terminal fourth. The sexes are alike and no seasonal changes occur. It is found in summer and breeds throughout North America, chiefly east of the Rocky Mountains, and spends the winter in upper South America. Unlike most of the group this is an upland bird, preferring dry plains and grassy fields to the vicinity of water. It arrives in early May and shortly after builds a nest of a few straws and grasses in a slight depression on the ground and lays four pyriform eggs of a clay color very thickly spotted all over with small discrete spots of brown and purplish gray. After the breeding season it leaves the meadows for cultivated fields and feeds very largely on crickets and grasshoppers, though other insects and berries are also eaten. This species flies high and swiftly and, unlike most sandpipers, will perch on fences and even trees. It has a peculiar wild cry which is heard by night as well as day. In the east the upland plover, by which name it is best known, is seen chiefly singly or in pairs and families, but in the great grass regions of Kansas and Texas, where it is very abundant, large flocks are formed. A species somewhat closely related to the upland plover in form and habit is the buff-breasted

sandpiper (*Tryngites subruficollis*) which is about eight inches long, breeds in the interior of British America and is nowhere very common during the migrations through the United States. Another related species is the well-known greenish spotted sandpiper or pee-wee (*Actitis macularia*) found everywhere throughout North America along small streams, as well as on the shores of lakes and the sea and breeding throughout its summer range. To most people it is the most familiar species of all the sandpipers and requires no description.

To the gunner most of these and other species of sandpipers are classed along with many of the plovers, yellow-legs, curlews, etc., as shore and bay birds, all of which are shot along the entire coast line during the autumn migration. These birds flock to the exposed shores to feed at ebb tide and are gregarious and attracted by their own or kindred species feeding on the beaches. The gunner places wooden decoys, cut and painted in rude imitation of the various species, at some favorable point and conceals himself behind a blind of seaweed or brush within range of his stool of decoys. As the birds pause over the latter to examine them, often in compact flocks, a single shot will often kill several, and large bags used to be secured during a single tide; but these birds have been so continuously persecuted that a dozen or two of the larger and medium sized species is now considered ample reward for a day's shooting. Species which, like the pectoral sandpiper, frequent the pools on the salt meadows are also caught by tramping or tolled within range of a blind by imitating their calls. The sport afforded by the upland plover is of a quite different and more worthy sort. These birds are extremely wary and difficult to approach and, as they do not flock in the East, may be brought within range only by a most careful approach, while their flight is so rapid as to require the best exertions of a quick and accurate shot. On the prairies of the West this same species is sometimes shot from a wagon, of which the birds are less suspicious. For the table most of the sandpipers are highly prized and few delicacies surpass a well-turned upland plover.

Bibliography.—Aflalo, 'Sport in Europe' (London 1901); Baird, Brewer and Ridgway, 'North American Water Birds' (Boston 1884); Coues, Elliott, 'Birds of the Northwest' (Washington 1874); Elliot, D. G., 'North American Shore Birds' (New York 1898); Hudson, W. H., 'The Naturalist in La Plata' (4th ed., London 1903); Sanford, 'The Water Fowl Family' (New York 1903).

SANDPOINT, Idaho, city and county-seat of Bonner County, at the outlet of Pend d'Oreille Lake, 325 miles north of Boise and 48 miles northeast of Spokane, Wash., on the Northern Pacific, the Great Northern and the Spokane International railroads. The region is noted for its superb scenery and excellent fishing, and there are lumber industries. Pop. 2,993.

SANDRART, sänd'rärt, Joachim von, German artist and art critic: b. Frankfort-on-Main, 2 May 1606; d. Nuremberg, 14 Oct. 1688. He studied painting and copperplate engraving under eminent painters and engravers at Utrecht and also traveled in England where he was employed by Charles I and the Duke of

Buckingham, and Italy (1627) where he became, at Rome, the intimate friend of Claude Lorraine. Among other pictures, he painted 'The Death of Seneca' for the king of Spain and a 'Nightpiece' in the style of Honthorst; besides furnishing the illustrations for 'Galeria Giustiniana' (1631). He executed under commission from Urban VIII several portraits and pictures for the churches in Rome and made a number of sketches in central Italy for M. Zeiter's 'Itinerarium Italiæ' and Gottfried's 'Archontologia Cosmica.' On his return to Frankfort he painted for Maximilian I of Bavaria in the gallery at Schleissheim 'The Twelve Months' and 'Day and Night.' He subsequently inherited the estate of Stockau, near Ingolstadt, assumed a title and henceforth gave a good deal of his time to art literature, painting also some portraits of the nobility. His masterpiece is 'The Company of Archers assembled to do Honor to Maria de Medici when she visited Amsterdam,' now in the town-hall of that city. But his works on art are so important that they have almost obscured his fame as a painter. These books include 'Deutsche Akademie der edlen Bau-Bild- und Malereikünste' (1675-79; critical edition by Sponsel 1896); 'Admiranda Sculpturæ seu Statuariæ Veteris' (1689), and 'Insignium Romæ Templorum Prospectus Exteriores et Interiores.'

SANDRINGHAM, sând'rîng-âm, England, in Norfolk, seven and one-half miles northeast of Lynn, is an estate comprising 7,000 acres. It was purchased in 1862 by the Prince of Wales, later Edward VII, who erected a mansion in Elizabethan style as a country residence. It is surrounded by a charming park of 200 acres. The "Norwich gates," the dairy and the cottages are interesting features. The Germans made an aerial attack on Sandringham in January 1915.

SANDROCOTTUS, sän-drô-kôt'ûs, the Indian king to whom Megasthenes was sent by Seleucus Nicator, in 306, as his Ambassador. Megasthenes improved the opportunity to collect materials for his historic work in four books, 'Indica,' which is the most important work of Greek antiquity upon that subject. According to this author Sandrocottus reigned over the Gangaridæ and Prasii, nations of the Ganges Valley. After the death of Alexander he extended his dominion over the whole of northern India, subduing even the Macedonians whom Alexander had put in possession of the Indus Valley and the Punjab. Seleucus received 500 war elephants from the Indian conqueror on confirming the cession of this territory and left Megasthenes as his Ambassador at the courts of Sandrocottus. This monarch, originally a robber chieftain, may now safely be identified with Chandragupta, whose accession is celebrated in the Sanskrit drama 'Mudra-rakshasa.' His capital was Pataliputra (Gk. Palibothra), modern Patna, a city situated in Bengal on the banks of the Ganges, and there he established the Mauryan dynasty. Consult Schwanbeck, 'Megasthenis Indica' (1846); Muller, 'Fragmenta Historicum Græcorum' (1841-70); McCrindle, 'Ancient India as Described by Megasthenes and Arrian' (1877).

SANDS, Benjamin Franklin, American naval officer: b. Baltimore, Md., 11 Feb. 1811;

d. Washington, D. C., 30 June 1883. He entered the navy as midshipman in 1828, was commissioned lieutenant in 1840 and served in the Mexican War. In 1851-59 he was engaged in the coast-survey service, receiving promotion to commander in 1855. In 1862 he was commissioned captain. In 1862-65 he was senior officer in command of the blockade off Wilmington, N. C., participated in both attacks on Fort Fisher, was in command of the blockade off the coast of Texas from February to June in 1865, and raised the flag at Galveston, the last post held by the Confederates. He was commissioned commodore in 1866, was superintendent of the naval observatory at Washington in 1867-73, commissioned rear-admiral in 1871 and placed on the retired list in 1874.

SANDS, Henry Berton, American surgeon: b. New York, 27 Sept. 1830; d. there, 18 Nov. 1888. He was graduated from the College of Physicians and Surgeons in 1856 and later studied abroad. On his return from Europe he became demonstrator of anatomy at the College of Physicians and Surgeons; in 1869 was appointed professor of anatomy and in 1879 professor of the practice of surgery, holding the latter position till his death. He was attendant or consulting surgeon for several different hospitals, but gradually gave up his hospital work to give his attention to a rapidly increasing private practice. He became one of the foremost surgeons of the city and was called for consultation in President Garfield's case. His publications include 'Aneurism of the Sub Clavian, treated by Galvano Puncture' (1869); 'Esmarch's Bloodless Method' (1875); 'Treatment of Intussusception by Abdominal Method' (1877); 'Question of Trephining in Injuries of the Head' (1883), and 'Rupture of the Ligamentum Patellæ and its Treatment by Operation' (1885).

SANDS, Robert Charles, American poet and author: b. Flatbush, L. I., 11 May 1799; d. Hoboken, N. J., 17 Dec. 1832. He was graduated from Columbia in 1815, admitted to the bar in 1820, but devoted himself almost exclusively to literature. He established and edited in 1824 the *Atlantic Magazine*, which later became the *New York Review*, and in 1825-27 was associated with William Cullen Bryant in editing it. From 1827 until his death he was on the editorial staff of the *Commercial Advertiser*. He wrote with Bryant and Verplanck a series of essays published in the form of an annual, 'The Talisman' (1828-30), in which appears one of his longest poems, 'The Dream of the Princess Papantzin.' He also wrote 'Historical Notice of Herman Cortes' (in Spanish, 1828); 'Life and Correspondence of Paul Jones' (1831); 'The Dead of 1832' (poem, 1832), etc.

SANDS, William Franklin, American diplomatist: b. Washington, D. C., 29 July 1874. He was educated at Saint Michel, Fribourg, Switzerland, Stella Matutina College, Feldkirch, Austria, and Georgetown University, Washington, D. C. He was appointed second secretary of the American legation at Tokio, Japan, in 1896; became first secretary at Seoul, Korea, two years later and was chargé-d'affaires ad interim in 1899. From 1900 to 1904 he was adviser to the emperor of Korea, in 1905-07 was secretary and chargé at Panama, in 1907-

08 in Guatemala and in 1908-09 in Mexico. In 1909-11, Mr. Sands was American Envoy Extraordinary and Minister Plenipotentiary to Guatemala. While in Korea he suppressed a revolution on the island of Quelpaert and for his services to French citizens during the Boxer Rebellion he was made Chevalier of the Legion of Honor. Mr. Sands is a member of the American Society of International Law and of the American Geographical and other societies.

SANDSTONE, consolidated sand. The grains of a sand, chiefly silica, may be compacted by pressure alone, forming easily workable free stone, but generally they are held together by some cement, as (1) iron oxide, which coats the grains and cements their adjoining portions, forming a brown-stone; (2) silica, which fills in the interstices between the grains and generally causes secondary enlargement of each grain in such a manner that the new quartz forms a continuous crystal (as far as optical properties, etc., are concerned) with the old quartz grain, the rock thus becoming a solid mass of crystalline quartz; (3) lime; or (4) clay, forming calcareous and argillaceous sandstones respectively. Impure quartz sandstones may be argillaceous, calcareous, feldspathic, glauconitic or micaceous, according to the admixture. When derived from unassorted disintegration-products of crystalline (feldspathic) rocks, they are called "arkoses." Sandstone composed wholly or in large part of comminuted coral or shell sand, cemented by infiltrated calcium carbonate, have been called "calcerenites," and make up extensive beds of clastic limestones to which the name sandstone is commonly applied by the quarrymen. Such lime-sandstones may analyze as high as 99.6 per cent calcium carbonate. Ordinarily the term sandstone is applied to quartz sandstones whether pure or impure.

Sandstone very commonly shows lines of stratification or bedding, where exposed in section, and a cross-bedding structure is very common, the various minor layers of a bed being inclined in different and often opposite directions. All sandstones of shallow-water deposit may show ripple marks, rill marks, wave marks and impressions and traces of various animals, while æolian sandstones may show fine bedding and wind rippling, together with great diversity in thickness. Fossils are not uncommon in sandstones, but only their impressions generally remain in the more porous rocks.

In the United States quartz sandstones are widely distributed geographically and geologically. Among the more important commercial deposits are the following: The Cambrian sandstone of New York (Potsdam sandstone), Wisconsin, Minnesota, Michigan, etc. (Saint Croix sandstones), and the Rocky Mountain region, as well as early Cambrian sandstones of the southern Appalachians; the Ordovician (Saint Peter's) sandstone of the upper Mississippi; Medina (Silurian) sandstones of New York and Pennsylvania; the Oriskany, Hamilton and Portage (Devonian) sandstones of New York, mostly used for flagging purposes; the Waverly (Lower Carboniferous) sandstones of Ohio, which furnishes the bulk of all the whetstones and grindstones of the country; the Pottsville and lower Coal-measures sandstones of Pennsylvania, West Virginia, etc.; the red-sandstones of the Connecticut Valley; New Jersey and

Nova Scotia (Jura-Trias), and the Dakota (retacic) sandstone of the West.

"Old Red Sandstone" is the term applied to the continental (non-marine) type of deposit formed during the Devonian era in Great Britain and Ireland. This consists of a mass of red sandstone shales and conglomerates from 10,000 to 16,000 feet in thickness and contains igneous rocks aggregating 6,000 feet thick near the middle. From it many remarkable first-remains have been obtained. New Red sandstone was used for red sandstone of Permian and Triassic age in Great Britain. Consult Ries, H., 'Building Stones and Clay Products' (New York 1912); 'Mineral Resources of the United States' (Washington, ann.).

SANDUSKY, Ohio, city, port of entry, county-seat of Erie County, at the mouth of the Sandusky River, on Sandusky Bay, and on the Baltimore and Ohio, the Cleveland, Cincinnati, Chicago and Saint Louis, the Pennsylvania, the Lake Erie and Western and the New York Central railroads, about 55 miles west of Cleveland. A number of electric railroads enter the city from Cleveland, Toledo, Lorain, Norwalk and other places. Johnson's Island, near by, was used as a place of confinement for Confederate prisoners during the Civil War. Cedar Point, Put-in-Bay, Kelly's Island, Middle Bass, Pelee and Gibraltar islands are all favorite fishing resorts and easy of access during the summer months. The city has steamer connections with all the principal ports on the Great Lakes and considerable trade with Canada. The city is in a fertile agricultural region, in which the chief products are grapes, peaches, apples, grain and vegetables. Fishing is an important industry of the city; the annual amount sold in the local market and shipped is \$1,500,000. The annual amount of wine shipped is about 2,000,000 gallons. Sandusky has 141 industrial establishments, 28 of which are engaged in the products of iron and steel and other metals. Farm tractors, marine aeroplanes and stationary motors, iron and steel castings being a large part of this number. Other important products are brick, glass, limestone, sand, wearing apparel, paper and paper products, boxes, tools and cement. There are large coal and lumber yards. The coal export business ranks very high, the Pennsylvania Railroad maintaining the largest single road coal terminal on the Great Lakes. Chemicals, paints, crayons and dyes are fast becoming one of the major industries, the largest part of the crayons used in the United States being manufactured here. There are two daily and two weekly newspapers. In 1915 the value of the annual product of the various industrial establishments in Sandusky was \$15,508,000, with an annual payroll of \$3,500,000. The United States hatcheries at Put-in-Bay and the State hatcheries at Lakeside foster the fish industry. There are four banks, two national and two State, with a combined capitalization of \$550,000 and total assets of \$9,000,000. The principal public buildings are the government building, public library, county courthouse, the State Soldiers and Sailors' Home with accommodations for 1,600 persons, and the new high school building, erected at a cost of \$275,000. Sandusky has 25 churches, 6 public grade school buildings besides the high schools, 4 parochial schools and a modern business college. The city was first settled in 1817

and was incorporated as a city in 1845. The Indians on 16 May 1763 captured Fort Sandusky and massacred the entire garrison with the exception of Ensign Paully, the commander. In 1782 the Indians defeated a force of 480 men under the command of Colonels Williams and Crawford. The municipal affairs are administered by a city commission of five and a city manager operating under the charter of 1915. Pop. 24,000.

SANDUSKY, a bay indenting the northern part of Ohio, an inlet of Lake Erie. It is 20 miles long and five miles wide and forms an excellent harbor. In some places large groves extend almost to the water edge.

SANDWICH, John Montagu, 4TH EARL OF, English politician: b. 3 Nov. 1718; d. London, 30 April 1792. He was educated at Cambridge, traveled extensively in the Mediterranean countries and in 1739 returned to England where he took his seat in the House of Lords and became a political follower of the Duke of Bedford. He became Lord Commissioner of the Admiralty in 1744 and was shortly afterward appointed captain in the Duke of Bedford's regiment. His promotion in the army was rapid and at his death he was senior general on the list. He was appointed Ambassador to Madrid in 1763, but before he could depart on his mission he was made one of the principal Secretaries of State. While in this office he took part in the famous prosecution of John Wilkes. In 1768 he became Postmaster-General and in 1771 was nominated First Lord of the Admiralty, an office he held for 11 years. His own gain and party interest were made of paramount importance and to the insufficient equipment of the navy was justly laid much of the disaster which the British navy encountered in those years. His administration was on the whole disastrous; his immoral private life was revealed by the murder of his mistress, and perhaps no man of the 18th century was held in more bitter contempt in England. He lived a practically retired life after 1782 and is the reputed inventor of the sandwich as a time-saver for his gambling propensities.

SANDWICH, Canada, town and county-seat in Essex County, province of Ontario, on the Detroit River, opposite the city of Detroit, Mich., and three miles below Maidstone, Ontario. There is a Roman Catholic college, a government fish hatchery and manufactures of wines and robes. Pop. 2,302.

SANDWICH, England, a cinque port and market-town in Kent. Saint Clement's Church is an example of early Norman architecture, and Saint Peter's dating from the reign of King John, has been restored and contains fine mediæval monuments.

SANDWICH, Ill., city in De Kalb County, 50 miles west of Chicago, on the Chicago, Burlington and Quincy Railroad. There are manufactures of corn shellers, plows, reapers and windmills. Pop. 2,557.

SANDWICH ISLANDS. See HAWAII.

SANDY HILL, now HUDSON FALLS, N. Y., village in Washington County, on the Hudson River, the Delaware and Hudson and the Hudson Valley railroads, about 52 miles north of Albany. There are rapids in the Hudson and Baker's Falls about 70 feet in descent,

which serve to furnish good water power. Hudson Falls is in an agricultural region and in the vicinity are quarries of the well-known Kingsbury building stone. The chief industrial establishments are lumber mills, brick yards, furnaces, machine shops, paper and pulp mills, wall-paper print works and the extensive bag factories of the Union Bag and Paper Trust. There are large shipments of stone, farm products and manufactures. The three national banks have a combined capital of \$150,000. The village has an excellent high school, public graded schools and a public library founded in 1867, also a public park. It is one of the two county-seats of Washington County (Salem the other), has a courthouse and jail; also county clerk's office removed there (1905) from Argyle. Its name was changed to HUDSON FALLS in 1910. Between Hudson Falls and Fort Edward in the Union Cemetery is located the grave of Jane McCrea (q.v.); also that of Maj. Duncan Campbell of Inverawe, killed at the battle of Ticonderoga, 1758. Pop. 6,000.

SANDY HOOK, N. J., a low, sandy peninsula in Monmouth County, about 18 miles south of New York. It begins at the Navesink Highlands and extends north six miles; its width is less than a mile. On the west side of the peninsula is Sandy Hook Bay. At the northern extremity is a beacon light and, about a mile south of this point, is a lighthouse, 90 feet in height. At the outermost point is Fort Hancock. On the peninsula is a government proving-ground for ordnance and armor-plate.

SANDYS, Sir Edwin, English statesman and colonist, second son of Edwin Sandys, archbishop of York: b. Worcestershire, 9 Dec. 1561; d. October 1629. He was graduated at Corpus Christi College, Oxford, in 1579, taking his B.C.L. there in 1589. He entered upon a political career in 1599 and became a supporter of James I, upon whose coronation in 1603 he was knighted. He was a member of the king's first Parliament, and in 1619-21 he was treasurer of the Virginia Company, which he ably promoted, rendering assistance enabling it to surmount many initial difficulties, and continuing his interest in the colony's affairs until his death. He was in his later years suspected of sympathy with the Parliamentary cause, but retained the favor of the king. Consult Brown, A., 'Genesis of the United States' (1890); Fiske, J., 'Old Virginia and Her Neighbors' (2 vols., 1900).

SANDYS, George, English poet, traveler and Virginia colonist, brother of Sir Edwin Sandys (q.v.): b. Bishopsthorpe, Yorkshire, 2 March 1578; d. Boxley, near Maidstone, Kent, 1644. He studied at Oxford and later traveled in France, Italy, Turkey, Egypt and Palestine, writing an account of his journeys, which was of considerable ethnological and geographical value. He was appointed treasurer of the Virginia Company in 1621, succeeding his brother, Sir Edwin, and sailed for Virginia soon afterward. He built the first water mill there and established shipbuilding and iron works. He was treasurer until 1625 and was appointed member of council in 1624-26-28. In 1631, after some controversy concerning his alleged infringements of the rights of other settlers, and failing to receive the post of secretary to the

new Commission for the Better Plantation of Virginia, he returned to England. He translated while in Virginia the first 10 books of Ovid's 'Metamorphoses' (1626), the first work of the sort accomplished in America, and upon which his reputation as a poet rested to a considerable extent. He was also author of 'Paraphrase upon the Psalms and Hymns' (1636); 'Paraphrase of the Song of Songs' (1641), and translated Grotius's 'Christ's Passion' (1640).

SANFORD, Edmund Clark, American college president: b. Oakland, Cal., 10 Nov. 1859. He was graduated at the University of California in 1883 and in 1888 took his Ph.D. at Johns Hopkins University, where he held a fellowship in 1887-88. He taught at Oahu College, Honolulu, Hawaii, in 1883-85; became connected with the faculty of Clark University in 1889, was professor of psychology there in 1900-09, and since then has been president of the university. From 1895 he was joint editor of the *American Journal of Psychology*; and he was president of the American Psychological Association in 1902. He is author of many papers on psychology and of 'A Course in Experimental Psychology' (1898).

SANFORD, Henry Shelton, American diplomatist: b. Woodbury, Conn., 15 June 1823; d. Healing Springs, Va., 21 May 1891. He studied for a time at Heidelberg University and in 1847 entered the diplomatic service and became attached to the Saint Petersburg legation. The next year he was acting secretary to Andrew J. Donelson at Frankfort and during 1849-54 secretary of legation at Paris. He was United States Minister to Belgium, 1861-69, and rendered service of the utmost importance during the Civil War. He negotiated the Scheldt Treaty of navigation and commerce and the first postal convention with France. In 1877 he was a founder of the International African Association (now the Independent State of the Kongo) and secured the recognition of its independence by the United States. In 1885 he was a delegate to the International Kongo Conference at Berlin, and in 1889 a delegate to the Anti-Slavery Conference at Brussels. In 1870 he founded the city of Sanford, Fla., and in later years gave much attention to its development.

SANFORD, Fla., city in Seminole County, on Lake Monroe, an expansion of the Saint John's River, and on the Atlantic Coast Line, 125 miles south of Jacksonville. The land was sold to Gen. H. S. Sanford in 1870, and he surveyed and cleared the site of the city, and built a saw mill, shops, etc. It has brick-paved streets and cement sidewalks. It is at the head of navigation for large steamers and exports oranges and other fruits and early vegetables. It contains railway car shops, machine shops, fruit preserving and cigar factories. There is a public high school, a grammar and two grade schools. Pop. 5,500.

SANFORD, Me., town in central part of York County, on the Mousan River, and on the Boston and Maine Railroad, 35 miles southwest of Portland. The land was purchased from the Indians in 1661 and the project of laying out a town was formed as early as 1676, but no permanent settlement was made till after 1730—the exact date being uncertain. The chief man-

ufacturing industries include shoe factories, woolen and worsted mills, flour and grist mills, saw and lumber mills; a capital of about \$5,000,000 is invested in its industries. A large electric power shop derives power from the river and supplies the factories and lights for the town. There is a high school, established in 1874, and a public library which was founded by a library association in 1898 and became a free public library in 1900, and a town-hall. Its three banks have combined resources amounting to \$3,100,000. The value of taxable property is \$4,800,000. The government is vested in a town clerk, three selectmen, a treasurer, school board of three, auditor and the usual minor town officials. The municipal receipts and expenses average about \$133,000. Pop. 14,500.

SANGALLO, säng-gäl'lō, Antonio da, Italian architect: b. Florence, 1455; d. there, 1534. He built in Montepulciano the church of the Madonna di San Biagio; the palaces Cervini and Bellarmini; in San Savino the palace of the Cardinal di Santa Prassede, in Arezzo the church of the Annunziata and the citadel in Civita Castellana.

SANGALLO, Antonio da (COORDIANI), Italian architect, nephew of the preceding: b. Mugello, near Florence, 1485; d. 1546. He designed and built the church of Madonna di Loreto, at Rome; the Porta di San Spirito; the church of San Spirito; the palace Sacchetti; the palace Farnese; all in the same city. He also enlarged the Vatican and executed the famous fountain at Orvieto and had a share in building the Pilgrim's Church at Loreto. He was also successful in the construction of fortifications.

SANGALLO, Giuliano da, Italian architect (brother of Antonio the Elder): b. Florence, 1445; d. there, 1516. At Florence he built the monastery of Santa Maria Maddalena de Pazzi and the Palace Condi; in Prato, the church of Madonna delle Carceri; in Cajano, the Villa Poggio for the Medici. He also constructed the fortress at Ostia; and in Rome he built the façade of Santa Maria dell Anima; the monastery of San Pietro in Vincoli, and the flat roof in the church of Santa Maria Maggiore. He also constructed the citadel at Pisa. Consult Redtenbacher, 'Die Architektur der Renaissance' (1886).

SANGAMON, säng'ga-mōn, a river of Illinois, its headwaters are in Champaign and McLean counties. It flows southeast to Sangamon County where it unites with the south fork of the river, and changes the direction of its course, flowing northwest, then west, then northwest and enters the Illinois River by two channels. Total length, 225 miles. The confluence of the main stream (north fork) and the south fork is six miles east of Springfield and the mouth of the river is about 44 miles west-northwest of Springfield.

SANGER, Adolph L., American lawyer: b. Baton Rouge, La.; d. New York, 3 Jan. 1894. He was graduated from the Columbia College Law School in 1864, and in the practice of his profession won rapid success. In 1870 he was appointed one of the commissioners of the United States Deposit Fund, and in 1885 was elected president of the board of aldermen of New York by a plurality of 25,000 votes. He

was a Presidential elector of the State of New York in 1880 and 1884, and 1886 was appointed commissioner of education, serving for three terms, and elected president of the board in 1893. He was one of the leaders of the Order of "B'nai B'rith," was president of the Board of Delegates of American Israelites, and for some years vice-president of the Union of American Hebrew Congregations.

SANGER, Joseph Prentice, American military officer: b. Detroit, Mich., 4 May 1840. In 1858-60 he studied at the University of Michigan and in 1872 received the degree of A.M. at Bowdoin. He served in the Civil War, being successively second lieutenant of the First Michigan Infantry, second lieutenant of the First United States Artillery and first lieutenant after October 1861 with battery of light artillery. He was wounded and was twice brevetted for gallantry; was orderly officer to President Lincoln for a short time in 1862, and after the war was adjutant of his regiment. He took part in the expedition against the Fenians in 1866. In 1872-75 he was professor of military science, tactics and law at Bowdoin and in 1874 was admitted to the bar at Portland, Me. He was detailed to accompany General Upton on a tour of inspection of the armies of Japan, China, Persia, India, Turkey, Italy, Russia, Austria, France and England in 1875-77. In May 1898 he was made brigadier-general and in 1899 was assigned to command the department and subsequently the district of Matanzas, Cuba. Subsequently he was made director of the census of Cuba and Porto Rico; in 1901-02 was inspector-general and chief of the staff, director of the Philippines, director of the Philippine census in 1902; became major-general in 1904 and was retired the same year. In 1910 he was a member of the Brownville court of inquiry.

SANGIR (sāng-gēr') **ISLANDS**, Malay Archipelago, a group midway between the northeast extremity of the Celebes and the southern extremity of the island of Mindanao in the Philippine group. The largest islands of the group are Great Sangir, Siau (Siave, Siau) and Tagulanda. The former is the most northerly and contains the volcano of Aboe (4,000 feet), whose eruptions of 1812, 1856 and 1892 caused great destruction and appalling loss of life. All of the islands are mountainous, partly volcanic and well cultivated. From the craters of the volcanoes of Siau and Roang constantly issue clouds of sulphur, and earthquakes are frequent. The chief products are rice, pisang, sago and cocoanut-oil. Edible birds' nests abound in the smaller islands, yielding considerable profit. The exports are copra, nuts and nutmegs. The natives are Malays. They adopted in the 15th century the Mohammedan faith, but were afterward converted to Christianity by the Portuguese. The islands constitute a dependency of the Netherlands, and through the missionaries schools have been built. The islands are governed by pascas or princes. Pop. 76,900.

SANGRAAL, sāng-grāl'. See **GRAIL**, **THE HOLY**.

SANGRE DE CRISTO, sān'grā dā krēs'tō, a range of mountains in the south central part of Colorado. See **ROCKY MOUNTAINS**.

SANGSTER, Charles, Canadian poet: b. Kingston, province of Ontario, 16 July 1822; d. 1893. He was self-educated, and in 1849 became editor of the *Amherstburg Courier*, but shortly afterward returned to Kingston and engaged in journalism there. He was employed in the Post-office Department at Ottawa in 1868-86. His verse received favorable notice both in America and England, and the highly patriotic character of it is credited with greatly advancing the cause of confederation in Canada. Author of 'Saint Lawrence and the Saguenay' (1856); 'Hesperus and Other Poems' (1860).

SANGSTER, sāng'stēr, Margaret Elizabeth Munson, American writer: b. New Rochelle, N. Y., 22 Feb. 1838; d. 3 June 1912. In 1858 she was married to George Sangster, engaged in writing for periodicals and in 1871 became associate editor of *Hearth and Home*. In 1873-79 she was editor of *The Christian at Work* and in 1889-99 she was editor of *Harber's Bazaar*. After 1899 she was a staff contributor to the *Ladies' Home Journal*. Her works are marked by a high religious purpose and an earnest desire to brighten and beautify everyday life. Her juvenile works include 'May Stanhope and Her Friend'; 'Little Knights and Ladies,' etc. Among her most noted poems are 'Our Own'; 'The Sin of Omission'; 'Are the Children Home?' and her other publications include 'Poems of the Household' (1883); 'Home Fairies' (1887); 'Winsome Womanhood' (1900); 'Lyrics of Love' (1901); 'The Little Kingdom of Home' (1904).

SANGUINARIA, a monotypic genus, the bloodroot (q.v.) of the family *Papaveraceæ*, indigenous to eastern North America and often cultivated for ornament. It prefers sheltered places in woods, where it can grow in leaf-mold. The thick, palmately lobed leaf is lapped around the bud, which swiftly outgrows its protector, loses its two fugacious sepals and opens into a star-shaped flower with several fleshy white petals and a mass of golden stamens in the centre. The flower closes again at night or on shady days, since it blooms in the earliest, cool days of spring. The leaves continue to grow during the summer and become nearly seven inches long. The seeds are contained in spindle-shaped capsules. The whole plant is very brittle and succulent and when broken, especially at its thick fleshy root-stock, an acrid red juice flows copiously forth. This juice has caused the plant to be called bloodroot, and it was considered, by the doctrine of signatures to be a cure for blood diseases; later it becomes officinal as a cathartic, emetic and expectorant. The sanguinaria is also called red puccoon or Indian paint, because the aborigines used it as a stain for their skins and as a dyestuff.

SANHEDRIN, sān-hē'drīn, a Jewish court of justice, especially the supreme judicial tribunal of the Jews, existing in and before New Testament times. According to rabbinical tradition the institution of the Sanhedrin is to be traced to the time of Moses and the events mentioned in Num. xi, 16, 17, but this view is now generally rejected, and the time of its institution referred to a much later date. The most probable opinion is that it consisted of 71 members, including the president. From incidental notices in the New Testament we

learn that the members were drawn from three different classes: "the chief priests," consisting partly of those who had previously filled the office of high-priest and partly of the heads of the 24 classes into which the priests were divided: "the elders of the people," that is, the heads of tribes and family associations; and "the scribes," or those learned in the law. The Sanhedrin sat originally within the temple precincts every day from the conclusion of the morning sacrifice until the evening sacrifice; excepting on Sabbaths and festivals. At its head was a president, who bore the honorable title of *nasi* or *prince*. The jurisdiction of the Sanhedrin, as the supreme tribunal of the Jews in civil as in ecclesiastical matters, was very extensive. It was the final court of appeal from all inferior courts; and, in addition to this, it alone had the right of judging in matters affecting a whole tribe, of determining questions of peace or war, of trying the high-priest or a disobedient member of its own body. It pronounced also upon the claims of prophets and upon charges of blasphemy. Its jurisdiction was not confined to Palestine, but extended to every place where the Jews had settlements (Acts ix, 2). According to the Jerusalem Gemara, the power of inflicting capital punishment was taken away from this tribunal 40 years before the destruction of Jerusalem, and this accords with the answer of the Jews to Pilate (John xix, 37), "It is not lawful for us to put any man to death." It might indeed pass sentence of death, but it required the confirmation of the Roman procurator before such sentence could be executed. The forms of procedure in the court seem to have been characterized by a general spirit of fairness. Different kinds of evidence were carefully weighed, and the agreement of at least two witnesses was necessary to procure a sentence of condemnation. A majority of the full membership was sufficient for a sentence. The place of meeting of the Sanhedrin was eventually changed to a portion of the court of the Gentiles, and, after several other changes, its seat was finally established at Tiberias. Besides the great Sanhedrin there were also inferior courts or lesser sanhedrins in the country towns, composed of persons of the same classes, and in contradistinction to these, the metropolitan council was termed the Great Sanhedrin. After the destruction of Jerusalem by the Romans these courts were abolished. Napoleon I convened a court under the name Sanhedrin, and it established 12 legal principles for the government of Jews in France. This was also called the Assembly of Notables and was dissolved in 1897. Consult Tama, 'Transactions of the Parisian Sanhedrin' (London 1807).

SANHITA, *sān'hī-tā*, the Hindu designation of that part of the sacred writings of the Brahmins, which contain the mantra or hymns.

SANIDINE, or **GLASSY FELDSPAR**, an important rock-forming mineral. It is a variety of orthoclase, is found in tabular or square-prismatic crystals, often Carlsbad twins, frequently quite vitreous in appearance. It occurs only in the recent eruptive rocks such as obsidian, phonolyte, trachyte and rhyolite. Its best-known locality is the Drachenfels, Germany.

SANITARY COMMISSION. See UNITED STATES SANITARY COMMISSION, THE.

SANITARY ENGINEERING, the branch of civil engineering which relates to structures and operations for promoting and guarding the health of communities. It deals with the means of providing cities and towns with pure and wholesome water, with the means for the removal in underground channels of the spent water supply called sewage, as well as of such ground water and rain water as may be necessary, and also with the means of collecting and removing the various solid waste products and refuse by cartage, such as garbage, rubbish, ashes and street sweepings. In other words, sanitary engineering embraces the design and construction of all works contributing to public health and comfort and all means of preventing offensive conditions due to a large number of persons living closely together, as in cities or towns.

In all cases the sanitary engineer, giving his first attention to sanitation, should have for his second purpose the construction of his works so as to bring about the desired result at the least cost, when considering both the first investment and the operating expenses.

The relations of the public health to this branch of engineering are made plain in the article **SANITARY SCIENCE**. With the rapid advance of practical knowledge the profession of sanitary engineering has in recent years gradually called for an increased practical knowledge of vital statistics, of chemistry and biology as applied to its special branches. It is not necessary for the sanitary engineer to be a trained analyst, or accomplished in the details of state medicine, but he should be in touch with the general progress in these subjects, if his work is to be on the highest plane of excellence. This necessity will be better appreciated after noting a brief review of the leading phases of sanitary engineering.

In Europe, progress in sanitary engineering commenced at an earlier date than in America, largely because the population abroad was much denser. The need for improvements resulted in laws which compelled the installation of better sanitary works at a rapid rate. In this country the States of Massachusetts, New York, Ohio and a few others, through their boards of health, have a general supervision of questions of water supply and sewerage, so far as the sanitary aspects of new or additional works are concerned. This has been generally helpful, and eventually will probably be extended to practically all of our States. The rules, regulations, etc., of the State sanitary authorities on these matters is a feature of the subject which the sanitary engineer has to consider, as well as the decision of courts where these form a precedent relative to the sanitary problem under consideration.

For a clearer discussion of the subject to be dealt with hereunder, it will be well to divide it into three parts: (1) Water Supply and Its Purification; (2) Sewerage and Sewage Disposal, and (3) Refuse Collection and Disposal.

1. Water Supply and Its Purification.—In Biblical days, pure mountain water in some instances was collected and conveyed through gravity aqueducts to cities and towns. There are some cases to-day, even in civilized coun-

tries, where substantially the same procedures as used many centuries ago are still applied. Generally speaking, however, the rapidly increasing density of population, the wide differences in climatic, geological and topographical conditions, and the improvements made in materials and methods of construction, have rendered necessary a vast elaboration of the early principles, in order to furnish the essential basis upon which modern water supplies under various conditions are built and operated. This is true to a greater degree in the case of works for the purification of sewage and water, and the disposal of garbage, which have more recently furnished practical problems in this country.

In the field of water supply engineering there are some instances where pure mountain waters can be readily obtained; some where the supplies can best be obtained from underground sources; others where the most available supplies are obtained from rivers near at hand, which require purification and pumping to reservoirs of artificial construction and still other instances where large cities have at hand only small streams, upon which it is necessary to build large dams to store water during the rainy seasons to serve the needs of the community during times of drought.

Before the development and general acceptance about 1880 of the germ theory of disease, comparatively little attention was given to the sanitary character of water supplies. Although the danger of sewage pollution was then recognized by some, its full significance was not appreciated, especially in the case of watersheds where the population was largely rural in its nature, until there were encountered disastrous typhoid fever epidemics, as at Plymouth, Pa., Lowell and Lawrence, Mass., New Haven, Conn., etc. In recent years there has been a marked awakening to the needs of pure water supplies in America, as shown by the consideration given this subject by a majority of the larger cities, and by the practical accomplishments reached in many instances. Compared with the European water supplies, there is yet wide room for improvement in this country, as our prevailing standards are generally below those established in northwestern Europe. Thus, in Germany it is an edict of the Imperial Board of Health, following the cholera epidemic in Hamburg in 1892, that no surface water shall be used as a public water supply without first being filtered in a satisfactory manner. In Europe generally this view is now held, and the benefit is shown by the fact that the death rate from such water-borne diseases as typhoid fever is only one-third to one-half of what it is in American cities.

As to the so-called mountain streams, the rapid increase in population in this country makes it each year more and more difficult to obtain even reasonably pure municipal water supplies from sparsely inhabited watersheds. In the case of small cities and towns this can still be done in some instances, but usually it necessitates the purchase of many properties situated on the watercourse, and a systematic patrolling of portions of the remaining area, in order to guard constantly against pollution. This latter procedure is especially effective in conjunction with large storage reservoirs in which self-

purification takes place, as in the case of the New York and Boston supplies.

A ground water supply, where the conditions are favorable, yields as good a water from a sanitary standpoint as can be obtained. This results, of course, from the efficient filtration which takes place under the conditions of nature, as the rainfall percolates through the earth and reaches the underground natural reservoirs from which it is drawn. In this country the most notable ground-water supply is that which furnishes about half of the supply for the city of Brooklyn, and aggregates a daily quantity of about 50,000,000 gallons. Long Island is essentially a large territory of sand, the pores of which afford facilities for the storage of large volumes of rain-water in this naturally formed reservoir, and from which water can be obtained continuously during ordinary dry weather in daily quantities equal to at least 400,000 gallons per square mile. These conditions are unusual, and there is no other instance where such a large volume of underground water is obtained. Many small cities and towns, however, obtain a satisfactory supply from underground streams, which flow through valleys containing deep layers of porous sand and gravel. With varying conditions in the geological formation, these underground supplies naturally present marked differences in the quality of water obtained therefrom. In some instances the ground water is very highly charged with lime and magnesia, thus making the water too hard for acceptable use by the consumers, and especially by those who use it for steam-raising purposes. Under these conditions the sanitary engineer has sometimes to consider the chemical aspect of the problem and to recommend plans for the softening of the water, such as is the case in many places in the southern part of England, where water is obtained from wells driven into the chalk cliffs, and in some of our own cities of the Middle West.

Another feature which the sanitary engineer has to consider with regard to ground waters is the presence of iron dissolved from the materials in which the underground water is stored, and which causes it to deposit iron rust, which is seriously objectionable because of the stains it produces in laundry use. This feature can be eliminated by aerating the water and passing it through filters, as is done at Reading, Mass., Red Bank, N. J., West Superior, Wis., and a number of places in the northern parts of Germany and Holland.

Water derived from rivers flowing near cities and towns forms one of the principal sources of supply in America. In early years raw-river water supplies were fairly satisfactory in their hygienic condition. But with the rapidly increasing population, river pollution has become so great that now it is rare for a town or city of any size to obtain a fairly satisfactory supply from river water when taken in its raw condition.

In the Southern and Western country there is the added difficulty of the well-known mud-diness, due to the large quantities of silt and clay entering the rivers from soil erosion, and which for many months at a time make the water decidedly turbid and dirty. To remove this silt and clay constitutes one of the prin-

principal tasks of the sanitary engineer. This, as is described in **WATER SUPPLY**, is accomplished by sedimentation and filtration, and in the last few years a large number of the more important cities have projected, or are building, improvements of this nature.

The cities situated upon the Great Lakes at one time obtained from them clear and pure water quite readily. In the instance of several of the larger cities, however, the time has arrived or is rapidly approaching when there is serious difficulty in obtaining pure water from the lakes in its raw condition, owing to the amount of sewage which reaches the water supply intakes. Usually the pollution is from the city's sewers, but in some instances it is from those of neighboring cities. The earlier intakes, located half a mile or so from shore, were presumably in many cases capable of yielding as pure water as now can be obtained from intakes four miles or more distant from the shore. That the time is approaching when some treatment of the lake supplies is becoming desirable, if not necessary, is shown by the consideration given to that subject by the cities of Milwaukee, Chicago, Cleveland and Buffalo.

In the northern, and especially in the northeastern, section of the country, water supplies are frequently obtained from small streams, upon which it is necessary to store water in large impounding basins in order that portions of the rainfall of wet seasons may be made available for seasons of drought. This has developed many problems for the sanitary engineer to consider, especially the care necessary in the selection and preparation of reservoir sites to guard against various vegetable growths, such as give rise to objectionable tastes and odors. The storage of water for long periods of time in such basins naturally results in sedimentation, and in bleaching should the water be colored, which improves the quality of the water so far as its appearance and sanitary aspects are concerned, and which incidentally brings about safety through the long interval which elapses as the water passes through the basins, thus bringing about the death of many objectionable germs which enter the reservoir.

The number of water purification plants for municipal water supplies is rapidly increasing each year, and eventually it is fair to assume will include every important surface-water supply in America, as is now the case in the most developed parts of Europe. There are now in this country over 200 filtration plants, the great majority of which are plants of the so-called rapid or mechanical type, which were built at first in a not very durable manner and are lacking in many appurtenances now recognized as essential to good works.

While filtration works will always be necessary where the raw water is sometimes or always turbid and unpleasant to sight, there are many cases where the expense for filtration is prohibitive, but where some treatment or purification is necessary.

Since about 1905 a process has been developed in this country which has been a great boon to the sanitary engineer. It had been found that small amounts of hypochlorite of lime, and later of liquid chlorine, when added to the water would destroy pathogenic bacteria contained in it and yet not be injurious to the

consumer of the water. It was found contrary to what had previously been thought necessary, that not all bacteria required destruction, but only those that were pathogenic and fortunately least resistant to the chlorine. By this simple and comparatively inexpensive means, typhoid fever and similar bowel diseases, when due to a polluted water supply, are almost entirely prevented.

While American engineers can design and build good filtration plants, it is an unfortunate fact that up to the present time the filtration plants in America, of both the slow or sand type and the rapid or mechanical type, have not, generally speaking, been well operated, although there are exceptions to this rule in the case of filtration works of each type. The proper operation of waterworks systems to provide palatable and pure water at all times, especially in connection with purification or filtration works, is of exceeding importance and will require the aid of engineering talent. In this field there appears a favorable opening for many young sanitary engineers. In addition to the sanitary aspect of waterworks engineering, the engineer has frequent occasion to use his judgment and knowledge concerning other line of hydraulics, including the flow of streams, the construction of dams and reservoirs, pumping stations and distributing systems which will afford suitable quantity of water and pressure not only for domestic use but also for fire purposes. The engineer by his knowledge cannot only heighten the efficiency of his works, but save large sums of money, as, for instance, in the distribution system, by applying among others the principle that a pipe of double capacity will not cost twice as much money, etc.

It is important to control the quality of the water, not only for sanitary purposes, but also for the preservation of the piping system in a proper condition. If in purification plants too much carbon dioxide is allowed to remain in the water, we are apt to get the "red-water plague" caused by the rusting of the pipe system. It is also important to guard the supply from acquiring tastes, due to dead vegetation, which are difficult, if not impossible, to remove in modern filter plants.

2. Sewerage and Sewage Disposal.—A sewerage system has for its purposes the collection and removal of the foul waters of a community. The term "sewerage" is applied to the system of collecting pipes and underground channels. It begins in the houses at the various receptacles where water is used for cleansing purposes, extends through the streets and ends at one or more places where this dirty water, which we call sewage, is finally discharged. Sewage contains a small quantity of organic refuse matter in a condition to be easily and rapidly decomposed. In round numbers it contains in our country less than one part of organic matter and one part of mineral matter to every thousand parts of water. Although this organic matter is so greatly diluted, it is nevertheless capable of causing considerable trouble. It decomposes rapidly in warm weather or within 24 hours, and then putrefaction sets in with the accompaniments of offensive odors, due largely to the growth and activity of those lower forms of life called bac-

teria. Fresh sewage has no strong or offensive odor. It smells like dish water, and no worse odor than this prevails at the outfall or point of discharge, in a system of sewers that is not very large but is well planned, built and carefully maintained and operated.

It is one of the tasks of the sanitary engineer to cause sewage in its flow through the sewers to be discharged both quickly and completely, so as to allow no sewage matters to be stranded and retained in the sewers. To this end it is necessary that the pipes be given a grade or pitch, which will cause the sewage to flow with a good velocity and keep on moving with its suspended matter without interruption, from the starting point at the house to the place of final disposal. It is also necessary to see to it that the curves, bends, junctions, etc., are so designed and built that they will not operate to retard the flow nor allow accumulations of solid matter at various points where they will decompose and give rise to objectionable odors. An important consideration, formerly overlooked, is the necessity of giving the sewage as smooth a surface as possible to flow upon. This not only causes less friction, a greater velocity and smaller sewers, but also prevents the adhesion and growth of algæ and suspended sewage particles, which by putrefaction produce foul-smelling gases. Therefore, vitrified pipes are advantageous. When bricks are used the mortar joints should be carefully smoothed. When cement concrete is used the interior surface should be well compacted and smoothed.

To avoid trouble from bad odors it is necessary to have an open and free communication from the sewers of the houses and streets to the outer air, so that there can either be a free escape or free admission of air, as the case may be, and so that a constant atmospheric pressure is maintained on both sides of all traps to the system.

Due to the variation in the volume of liquid flowing through the sewers at different times of the day, it is impossible to avoid entirely some incidental deposits of solid matters by adhesions to the sides of the sewers, and accordingly it is essential from time to time to flush them, that is, to cause a materially increased flow of water intermittently to pass through them, either by natural or artificial means. To secure the best ventilation of the sewers it is customary to have frequent openings in the streets through manholes covered with gratings and also to extend the house pipes beyond the roofs, so that the differences of temperature in the various parts of the sewer system will permit of a free and natural circulation of air.

The removal of ground water and storm water forms another of the tasks of the sanitary engineer. In some cases they are removed in the same sewers as is the domestic sewage. Then we have a so-called combined system of sewerage. In others there are separate systems for removing the storm water and the sewage. Where cities are situated on very flat areas, drainage is one of the most important municipal works, as at New Orleans, where extensive drainage canals and pumping stations are in operation to collect the rainfall and discharge it into Lake Pontchartrain.

There were very few well-built sewers in

this country, prior to 1875, and no city which was equipped with a thorough system. Since 1880 great progress has been made in this branch of sanitary engineering in America, partly due to the fact that American cities, as regards sanitary matters, were far behind the European cities, notably in England and Germany, and partly due to the rapid growth of many communities in this country. Many sewerage systems are now built in the United States, the design and construction of which compare favorably with European works.

Prior to 1880 the subject of sewage disposal and sewage purification made little demand upon the sanitary engineer, for the reason that invariably the sewage was discharged into the nearest watercourse and, generally speaking, serious nuisances did not result under the conditions then existing. With the development of sewerage facilities in this country and the increase in population this subject began to press for attention. In Europe there were a few isolated cases where sewage had been used for purposes of irrigation for 100 years or more, but it was not until the middle of the 19th century that it became the object of careful study in Europe, especially in England.

The first method of purification for the disposal of sewage was that of irrigation, that is, the application of sewage to land to facilitate the raising of crops. In some places, as Paris and Berlin and many places in England, this is still done with considerable advantage, although in no instance does the income received from the sewage farms equal the capital charges upon their purchase and adaptation for irrigation purposes. In many places, also, it is very difficult and expensive to secure adequate areas of suitable land within any reasonable distance of the community having to dispose of the sewage. This condition resulted about 1850 in England in various efforts to secure those constituents of sewage which may be used for fertilizing purposes in a manner so that they could be placed upon the market. Various chemical treatments to facilitate this end were developed and patented, until there was suggested a chemical treatment for the disposal of sewage which involved the use of one or more of nearly every chemical which was then manufactured on a commercial scale. Although all efforts then and since failed to establish any method by which the fertilizing properties of sewage could be availed of with commercial success, this proposition now and then still comes to the attention of the sanitary engineer. The cause of the impracticability of this feature lies in the great dilution of the sewage matters and the expense of handling so much other material to get in available form so little nitrogen, potash and phosphorus. In arid parts of our country the value of the fertilizing parts of the sewage is almost insignificant to that of the water itself for the irrigated farms, particularly as its supply is quite regular and reliable. The problem of sewage disposal has been and will continue to be one for the sanitary engineer to solve at the least expense necessary for getting rid of the sewage in a manner so that there will be no sanitary objection to the procedure.

After 1870 chemical precipitation processes in various forms were introduced throughout Europe, especially in England, where the density of population and the small size of the streams

first forced the attention of engineers to this general subject. In some instances chemical precipitation, which can remove under favorable circumstances about 50 per cent of the objectionable organic matter and about 90 per cent of the total suspended matter, was adequate for local conditions. In this country chemical precipitation works were built about 1890 at Worcester, Mass., and were earlier projected for Providence, R. I., although many delays occurred in the carrying out of the works for the latter city. A few small cities also adopted this method of purification, but it seems to have had no widespread development in America, nor are there indications that such will be the case in the future. In England chemical precipitation methods have in many cases outgrown their usefulness, due to the fact that they are not capable of producing a sufficient degree of purification, and the time is ripe when other and more efficient methods must be considered to supplement chemical precipitation works if the latter are to be used at all. Thus, at Worcester, Mass., several acres of sand beds have been built by which to further purify the effluent of the chemical precipitation works. In New England, generally speaking, sufficient areas of porous land (glacial drift formation) are available, so that the cheapest and best method of sewage purification is afforded by the application of the sewage to land for short periods at a time, between which the land is thoroughly cleansed by the entrance of air. This is called intermittent filtration.

There are two aspects to the problems of sewage disposal. One refers to conditions when it becomes necessary to purify the sewage so as to protect the body of water into which it is discharged, if this is to be used for drinking purposes farther down stream. The other relates to the prevention of over-polluted bodies of water to a degree that results in nuisances from bad odors. In Massachusetts the first of these aspects of the problem of sewage disposal has been developed further than elsewhere in America. Intermittent sand filters have been adopted in numerous cases to purify the sewage with sufficient thoroughness so that the streams into which the filtered sewage is discharged may be used for drinking purposes after some additional treatment. Thus the sewage of the small cities and towns of Natick, Framingham, Marlboro and Westboro is purified nominally to protect the water supply of the city of Boston, and also the brooks themselves into which the effluent is discharged.

The prevailing method of sewage disposal in America is by a sufficient dilution in the most convenient watercourse. Seaboard cities find this method to be generally satisfactory, particularly if the sewage is first carefully screened so as to free it from those particles which would float and be unsightly. Some inland cities on lakes and large rivers can also dispose of their sewage in this manner satisfactorily for some time yet, but there are others where more or less trouble results at times of low stream flow, and these troubles are bound to increase as the cities grow in size. Many of them are gradually shaping things somewhat toward the ultimate adoption of some form of sewage treatment works, but generally the expense is so great that material progress is slow,

and it may perhaps only be accelerated by the action of the courts.

Sewage purification works require a continual municipal expense which usually results in comparatively little benefit to those who have to bear it. Accordingly, where land treatment is not available, cities are anxiously awaiting the results of new methods by which the cost of works of artificial construction will be lessened as compared with those of earlier designs. This is true not only in America but also in Europe, where improvements are needed in many cases.

Accordingly, a few years ago much was heard by the sanitary engineer of this country concerning the merits of the so-called septic process and of contact beds made of coke or broken stone, which procedures have been much studied in England since 1895. More recently still other methods have been proposed and much discussed in both England and our country. They are the activated sludge process which was very extensively investigated in Milwaukee and the Miles acid process tested in New England. The former is a process requiring a very thorough settling and aeration of the sewage. The result is a very clear and inoffensive effluent on the one hand and a concentrated but odorous sludge on the other, which can be converted into a good fertilizer. The Miles acid process is designed to extract grease from sewage, by adding sulphuric or sulphurous acid to precipitate the solids and by degreasing the resulting sludge.

All these methods are more or less intimately associated with biological processes by which the bacteria convert putrescible organic matter into harmless and stable mineral matter. While these processes are not so effective or economical as was at first claimed for them, they have merit and are worthy of careful consideration, where other methods are found more expensive or are impracticable. The disposal of liquid trade wastes is becoming an important factor in some of the industrial centres, and this problem is one which in future years is bound to come more and more within the attention of the sanitary engineer.

Generally speaking, the sewage disposal methods should consist of means (1) to remove the objectionable floating matter; (2) to let the solids readily settle; (3) to treat the liquid freed from floating and solid matter, so that it will be oxidized and become inoffensive. The first method may be accomplished by screens, also scum boards. The second by settling basins and tanks. Grit is deposited when the velocity slows down to less than 12 inches per second, and can be collected in small basins. Lighter matter will settle when the velocity is not over a very few inches per second. Large basins are required for this purpose, the size depending upon the quantity of suspended matter thus to be removed. The third method requires the oxidation of the liquid. This is accomplished by a discharge into a running stream of which the minimum flow is sufficient for the required oxidation (dilution). It is also accomplished by a percolating through porous material. If it is sand the percolation is slow and a high degree of oxidation is secured (intermittent filtration). If it is broken stone of egg size and the sewage is sprinkled over it the percolation is

more rapid and the oxidation is not as great (trickling filters), but is sufficient for many cases, particularly where a subsequent dilution in a sufficiently large stream can be given. Oxidation can also be accomplished by allowing the sewage to be in contact with the sides of broken stone for several hours and then discharged (contact beds). Here the oxidation is also not complete and usually requires subsequent dilution or sand filtration of the effluent.

The disposal of the floating matter is generally done, first by pressing and then by burning in a furnace. The disposal of the grit is generally by washing and then dumping. The disposal of the finer sediment forming sludge is less simple. The sludge from septic or single tanks has usually been dumped in shallow layers over prepared areas and dried. It is quite offensive until dry. The sludge from Imhoff or double-deck tanks is kept quietly under water and separated from the flowing sewage. This permits a decomposition that is not septic, the gases evolved being almost wholly carbon dioxide and methane. After several months the sludge is sufficiently decomposed so that it can be withdrawn, inoffensively dried and used as a garden soil which it resembles.

3. Refuse Collection and Disposal.—Another branch of municipal works to which the attention of the sanitary engineer is beginning to be drawn is the cleaning of streets and the disposal of garbage and other municipal wastes which cannot be removed by water carriage in underground channels. They include ashes, street sweepings, dry rubbish and kitchen garbage, all of which require collection by special cartage. In small communities the disposal of this refuse is not very difficult or expensive, but in the large cities it is frequently a perplexing and expensive undertaking. It is also an important sanitary matter, as disease, bad odors and general discomfort result from improper and ineffective attention to these matters.

Street cleaning in this country has not yet been developed to the standards of western Europe, which is due to their better methods of city government. The conditions for clean streets are, first, a firm and fairly smooth pavement; secondly, a well-trained and permanent force of cleaners and flushers; and, thirdly, a systematic and frequent sweeping, and, where practicable, also a flushing to remove the dust which cannot otherwise be thoroughly removed.

The refuse originating in the houses consists of garbage, ashes and rubbish. It is necessary to educate the people to a proper house treatment to prevent unsanitary conditions and to suit the method of collection which the city has established. This may be a combined or separate collection. If it is combined then all refuse is dumped at the house into the same receptacle or can and thus collected. If it is separate, then the refuse is generally and best separated into three parts—garbage, rubbish and ashes. Each material is put into a separate can and collected at different periods. Garbage, because it rapidly putrefies, should be collected daily or at least every two days in summer, and in winter at least twice weekly. Rubbish and ashes are collected weekly or monthly as deemed best. All vehicles should be specially designed to prevent any nuisance from leakage, dust or odors. The

collectors should be well trained to perform their specific duties and to thoroughly know their territory.

The disposal of refuse differs according to local conditions. It should first be sanitary and second economical. Sanitary engineering can now provide the solutions. In Europe the usual custom is a combined collection and a disposal by incineration. In America this is practised in some of our cities. In most of them a separate collection has been found to be more economical. The reason is that we discard and throw into the refuse much material which is utilized in European houses. The rejected matter when collected in large quantities may be utilized at a profit. Fresh garbage from American hotels and residences furnishes an excellent food for hogs and is valuable for this purpose. Many small cities in the United States and some large ones (Baltimore) are now adopting this method of disposal. Where it cannot be collected fresh enough for feeding it can be subjected to a treatment with heat and naphtha so that it yields a paying quantity of grease and of fertilizer filler. This process is called reduction and is employed in most of the large cities of this country, from New York down. The war has caused a greater economy in the use of food and, therefore, a serious reduction of wasted grease, so that most of the reduction works have lately been working at a great disadvantage.

Picking over the rejected matter at suitable establishments has also been practised in Europe as well as here. But in Europe it has almost entirely been given up, as the profit was small and the danger of disease propagation was feared. In our country picking is still practised in a few cities.

Incineration, used extensively in Europe, is also gaining in practice here. The general rubbish from houses, when it cannot be safely dumped to fill low places, is best disposed of by burning. It is the safest solution from a sanitary point of view and its destruction by fire is also generally the cheapest method if steam can be produced and used. It has been attempted to destroy also garbage in furnaces. While this may be a satisfactory sanitary disposal, it requires the addition of fuel, is therefore expensive and consequently the process is shirked. The temperature even when destroying organic matter is too low to produce steam. Better success has been had by burning garbage and rubbish together. The best success in Europe has been gained by adding also the discarded ashes, which in England contain about 25 per cent of unburnt coal.

In Europe and in some of our cities the incinerators have developed temperatures sufficient to produce steam, which is more or less utilized. In Hamburg and a few other cities the steam produced not only operates the plant, but is converted into electric power through storage batteries for wagons collecting the refuse. In all plants their required power and lighting is obtained from the incineration of refuse.

Shallow burial of garbage has also been practised with more or less success in forming productive soil, notably in Berlin, Germany. In our country the conditions are in many cases so different from Europe and even in the various parts of our country, that only a careful

study by competent engineers can reveal the best method, where the sanitary conditions are obtained at the least cost.

Speaking generally, the accomplishments in sanitary engineering in America since 1875 have been marked by furnishing cities and towns with good water supplies and with efficient sewers and drainage, and some have also plants for refuse disposal. Improvements in this line began at a later date here than abroad, and in many ways the Europeans are still in advance as regards the carrying out of the well-established principles of this subject, although the contributions and experiences of Americans have added much to its general knowledge, especially as applied to the specific conditions here existing. In no field of civil engineering does there appear a more promising opening for study and practical activity than in the sanitary branch. See also SANITARY SCIENCE.

RUDOLPH HERING,

Hydraulic Engineer and Sanitary Expert.

SANITARY SCIENCE. The term sanitary science is conveniently employed to cover that body of precise, correlated and organized knowledge which has to do with health, and especially such part of that knowledge as deals with the *environment* rather than the individual person. It is one of the inductive sciences like physics, chemistry and biology, of which last it is a subdivision. Like the other inductive sciences it depends upon observation, generalization and verification, and includes a body of established doctrines which have been reached by these processes. From the etymological point of view sanitary science is literally the science of health, and is, therefore, strictly speaking, equivalent to hygiene. Until quite recently, however, the term sanitary science was used in Great Britain largely to the exclusion of the term hygiene, while on the Continent the reverse was and still is the case. The present tendency in America appears to be to employ both terms, with somewhat special meaning attached to each; although the fact that large numbers of medical and scientific men have brought home with them from Germany the term "hygiene" is unquestionably having its influence in favor of this term in America as well as in Great Britain. The probability is that for the next few years at least both terms will be used, perhaps somewhat indiscriminately, sanitary science and sanitation being applied to the more familiar and more practical aspects of hygiene, such as water supply, milk supply and food inspection, and especially to its more engineering aspects; the term hygiene being more often reserved for the less familiar and especially for the more medical and physiological aspects of the science of health.

Definitions.—In point of fact there is today a real and practically important distinction between the two terms. Hygiene in its broadest aspect undoubtedly includes everything relating to health and covers, therefore, both personal and public hygiene. Of late years, however, with the development of its engineering aspects (sanitation) on the one hand, and its physiological aspects (especially serum therapy) on the other, there has come about a real and practical differentiation between hygiene and sanitation, the former being largely in the hands of physicians, the latter largely in the

hands of sanitary engineers. This differentiation has furthermore a sound biological basis; for if we regard health as the normal operation of the human mechanism and disease as its abnormal operation, then it is easy to see how some diseases may be warded off by increasing the efficiency (and especially the vital resistance) of that mechanism, while others may be prevented by an adequate control of the environment. Smallpox, for example, may be warded off by vaccination, a purely physiological or medical, and, therefore, on our classification "hygienic" process, but not by mere sanitation. Typhoid fever, on the other hand, was formerly prevented chiefly by proper control of the environment—for example, by the purification of water supplies, the purification of sewage and the protection of the purity of food supplies such as milk and oysters, these being "sanitary" procedures dealing directly with the environment, and only indirectly with the individual or person. To-day, however, it is also and very efficiently prevented by "vaccination" with a serum made from dead bacilli of the same disease. We may still advantageously employ both terms, namely, hygiene and sanitation (the basis of which latter is sanitary science), keeping hygiene more particularly for procedures directly affecting or dealing with the bodies of the people themselves and sanitation for procedures dealing directly with the environment and only indirectly with the human mechanism. If, however, the term hygiene be preferred for the whole subject, then obviously the engineering, environmental or "sanitation" aspects of it fall under the subdivision "public hygiene" or "public health," and the remainder under "personal hygiene" or personal health. See PUBLIC HEALTH; HYGIENE, etc.

It is important at the outset to form ideas as clear and definite as possible of the nature of health and disease, terms which though constantly used are often but little understood. We shall probably not go far wrong if we accept the dictum of Huxley that "the characteristic of modern as contrasted with ancient physiology is the conception of the human body as a physical mechanism" and regard the latter as an intricate piece of machinery subject to all the conditions and limitations to which any machine is exposed. If around this essentially mechanical view of the human body we throw that other modern conception, the "environment," that is to say, if we picture to ourselves the human body as a mechanism not only deriving energy from its environment and doing mechanical and other forms of work, but giving back to the environment heat and waste products (an idea which lies at the very basis of modern physiology), we shall readily arrive at a clear, consistent and helpful conception of the human mechanism and its workings, from which we can readily pass on to clear and logical ideas of health and disease. For in that case we have only to think of the body as a piece of mechanism with all its parts in good working order, or, in other words, sound, normal and whole, and working in a favorable environment, and to this condition to apply the term *health*. Conversely we may regard any condition of the mechanism in which one or more of its parts (organs) is seriously out of order, unsound or abnormal, or working under unfavorable conditions, as a condition of disease. In the normal, sound or

healthful condition the parts of the organism work together with ease, but in the unsound or abnormal condition this may not be the case and "dis-ease" may be the result. In short, the word health (related to the modern word *hale*, Old English *hole*) actually means hale-ness or whole-ness, in which form it appears for example in the Scriptural phrase "They that be whole need not a physician."

Health and Disease.—Sanitary science then regards health and disease very much as biology regards life, as a special state or condition, and the essential basis of health as sound and proper construction and operation of the human mechanism under favorable conditions. The sources of health are plain. They are obviously good timber, good construction and wise operation or management of the human mechanism, to which we must add favorable external surroundings or environment. In so far as sound and normal, or unsound and abnormal, mechanisms are inherited, they are clearly for the most part beyond the control of sanitation and hygiene, but in so far as health and disease are dependent upon good care, management or operation, and especially in so far as they are dependent upon favorable external conditions or environment, they are obviously to a greater or less extent subject to our influence and control; and herein lies the broad and practical field of the applications of sanitary science. If, for example, observation and experience have established the fact that certain trades are more than usually dangerous, then it is the privilege and the duty of the professors of sanitary science to verify and make known these facts. If it can be shown that certain climates are destructive of health and of life, while other climates conduce to good health and longevity, then it is the duty of students of sanitary science to establish and proclaim these facts. If, as appears from the results of innumerable investigations to be true, polluted water and polluted milk are apt to convey the germs of typhoid fever, these facts may be verified, made known and acted upon.

For the purposes of sanitary science diseases may be roughly classified into two grand divisions, namely, (a) those which are due to defects of material or construction or operation and may hence be described as *constitutional*, and (b) those which proceed more directly from external sources and are plainly due to mechanical injuries, parasites, poisons or other external or *environmental* conditions. These last the sanitarian may hope in part at least to control, while the former, being largely hereditary, are for the most part beyond his reach. It should not, however, be overlooked that the materials and construction of the mechanism may suffer damage from the action of slight or long-continued external influences, or that some so-called "constitutional" diseases may be really environmental in origin.

Causes of Disease.—Turning now to the obvious external causes of disease, with which in this article we shall chiefly deal, we may quickly dispose of those which are plainly chemical, mechanical or physical (burning, crushing, freezing, gunshot wounds, dagger thrusts, earthquakes, lightning and the like), of obvious external origin and preventable only by removing or avoiding the cause. In the same way we may set aside deaths by drowning or

execution (hanging, electrocuting, etc.), and even suicide in so far as this is produced by external conditions such as loss of friends, loss of property, etc., and not from internal or constitutional defects or changes. Another group of obvious external causes of disease is that series of phenomena which comes under the head of *poisons* coming in or acting from the environment, such as arsenic, strychnine, morphine, nicotine, caffeine, chloral, alcohol, cocaine, etc. Disturbances of the mechanism due to the entrance of these essentially foreign bodies are only too familiar and are obviously readily preventable by removing or avoiding the cause. There still remains to be dealt with, however, one great class of external causes which may be roughly grouped together under the head of living agents of disease or parasites; including in this term not merely the coarser and more obvious parasites such as tapeworms, fleas, lice, mosquitoes and trichinæ, but also those far more elusive and dangerous micro-organisms, the microbes, bacteria or disease-germs. Some of these are dealt with elsewhere (see BACTERIA; HOOKWORM ANATOMY AND LIFE HISTORY; MOSQUITO; PARASITES; TRICHINA; TAPEWORM; etc), but with the relations of these parasites (and more especially of the microbes) to the health of individuals and of communities we have still to deal.

The Germ Theory.—One of the most fruitful discoveries of the 19th century was the fact that some diseases of previously unknown origin, such as some of the more common fevers—typhoid fever, diphtheria, Asiatic cholera and tuberculosis—are due to the entrance into the body from the environment of certain micro-parasites, microbes or micro-organisms. When to this discovery was added another, namely, that these micro-parasites are capable of living for longer or shorter periods outside of the bodies of plants and animals, in the environment of man, and especially in earth, air, water, milk and other materials intimately associated with human life, it became easy to understand, what had up to that time been an insoluble mystery, not only how certain diseases are caused, but also how they are spread among the people and, at the same time, how they may be controlled and even overcome. The whole problem of the prevention, not only of individual cases of disease but of those wholesale attacks of disease upon communities which had long been known as epidemics, plagues and pestilences, now became possible of solution, and one of the most promising fields for the improvement of the health of communities as well as of individuals in the 20th century lies in a complete elucidation, along the lines thus marked out, of the precise methods by which diseases are caused and conveyed, and consequently how they may be prevented. To this end not only further knowledge is required, but also an education of the people at large in the elements of sanitary science, so that diseases anywhere arising may be restricted as nearly as possible to their places of origin and there by the arts of disinfection blotted out and exterminated. Once the principle has been clearly recognized that there exists a large class of diseases (known as the infectious and contagious diseases) all of which are probably due to the entrance into the bodies of animals or plants of living external agents, called germs, mi-

crobes, micro-organisms or micro-parasites, together with the additional fact that these germs or micro-organisms, microbes, micro-organisms or micro-parasites find their way from person to person either directly ("contagion") or indirectly in devious ways through the environment ("infection")—it becomes a fascinating study to detect and discover the precise routes by which infection and contagion travel; the material vehicles by which the germs in question are conveyed; the conditions of their "longevity" or endurance in the environment under various conditions; their resistance to agents of destruction, such as cold, heat, acids, alkalis and other disinfectants; their distribution from person to person, from community to community, and sometimes even from nation to nation, as they move in or are carried about by water, milk or other food materials; by insects such as flies, fleas and mosquitoes; by wind in the form of dust; by emigrants traveling from country to country; by letters through the post-office; and by linen through laundries, sweatshops, clothing houses or other like establishments.

Owing to the obscurity pertaining to most epidemics, plagues and pestilences, strange and unusual phenomena were formerly associated with them as causes. Terms such as "miasms," "effluvia," "telluric influences," and "formites," were commonly used to describe causes of disease not very many years ago, but to-day these have practically disappeared. As a result of the new points of view described in the foregoing paragraphs, infection and contagion are no longer regarded as obscure, mysterious influences, such as strange atmospheric conditions, earthy exhalations or intangible gaseous emanations from swamps or forests, but rather as due to the aggressive activity of specific organisms entering the body and causing within it definite and peculiar alterations. Like bullets, daggers, slivers and other extraneous bodies coming from the environment, these are material, tangible and recognizable causes of disease, natural rather than supernatural, and simply microscopic rather than macroscopic.

The search for the agents of disease had not, however, continued long before it began to be recognized that the invasion of the body by germs of whatever sort is, to all intents and purposes, an attack upon it by parasites, and once this became clear it was evident that, as in other cases of parasitism, the process is essentially a struggle between the invading parasite upon the one hand and the resisting organism on the other. We now know that the process by no means consists of an active attack upon a passive subject, but is rather a battle or a struggle between host and parasite (for example, between man and microbe), in which the physical or physiological conditions of the host tend on the one hand to overcome and destroy the parasite; while the parasite on the other attacks and injures the host in various ways, often by mechanical injury of tissue and sometimes by the excretion in the course of its own vital activity of products essentially poisonous or toxic to the host. In the case of diphtheria, for example, the diphtheria bacillus first invades the throat of its "host" or victim and, having established itself there, feeds and multiplies upon the surface-layers of the epithelium, producing meantime a violent poison known as the "toxin"

of diphtheria, which substance so damages the cells of the host in the vicinity as to allow a free exudation of lymph, and this, quickly coagulating, produces the white patches of the throat characteristic of this disease. But this is not all. Some of the toxin is also absorbed into the general circulation of the host and produces fever and other general constitutional symptoms of a grave character. Meantime the tissues of a strong and healthy host actively produce what are known as "antibodies" or "antitoxin," a substance capable of neutralizing the toxin either in the body itself or even in a test-tube; and it is owing to the possibility of causing some of the lower animals, especially horses, to be habituated to the diphtheria toxin, and to produce antitoxin in their blood that we have been enabled to secure from these animals this beneficent remedy for use in cases of diphtheria in human beings. In consequence of discoveries of this sort a field of splendid promise has been opened up for 20th century hygienists, along the lines of *serum-therapy* (as it is called), that is to say, the production of various blood serums rich in antidotes for the poisons generated by the microbes of specific diseases. See ANTITOXINS; IMMUNITY; SERUM-THERAPY; TOXINS AND ANTITOXINS; VACCINATION.

Parallel with preventive medicine we have to-day preventive hygiene and preventive sanitation—the first being essentially a modification of the body by medicines such as serums and vaccines; the second its modification by exercise, play, diet and the like; and the third the prevention of disease by control, not of the body but of the environment.

Practical hygiene and sanitation may obviously proceed along either of the two lines indicated, namely (a) reinforcement of the organism in its struggle with infectious microbes, or (b) exclusion of the microbes and their destruction in the environment. The latter is commonly known as "sanitation." It deals rather with the control of the environment than with that of the human mechanism, and it is, therefore, largely connected with problems of sanitary engineering. See HYGIENE; PUBLIC HEALTH; SANITARY ENGINEERING.

Professor of Biology and Public Health, Massachusetts Institute of Technology.

SANKHYA, sãn'khyā, the name of a philosophical system of ancient India. It is attributed to a writer by the name of Kapila, about whom we know absolutely nothing. While the extant texts do not date back much further than A.D. 1380 Sāṅkhya writings are known to have been translated into Chinese in the 6th century, and the inception of the school is probably considerably earlier. The philosophy is strictly a dualism, and indeed the name of the school may be translated as "pluralistic." The *Prakṛiti*, or matter of the universe, is opposed to the *Puruṣas*, or souls, of which there are an unlimited number. The *Prakṛiti* assumes eight

forms and 16 modifications. That deliverance from continual rebirth which constitutes the goal of all Indian philosophy is attained, according to the Sankhya school, by a complete knowledge of the soul principle and of the 24 modifications of matter. This deliverance consists in the separation of the soul principle from its pain-giving material environment. The material world has a certain history determined by its very nature. It is tripartite, consisting of goodness, darkness and passion. These were primitively in an equilibrium which gradually becomes upset until a new equilibrium is formed and a new universe. Without the intervention of the *Purusha*, the *Prakriti* develops within itself a world-intelligence. This generates consciousness, which by a gradual process of degradation gives rise to the cruder matter forming the object of our experience. Thus the entire psychical life, in so far as it may be analyzed and expressed in discourse, is derived from the matter constituent of the universe rather than from the soul constituent. The method in accordance with which the individual soul comes into contact with a particular part of the material universe is by no means clear. In whatever context it occurs, the soul is unmoved by emotion, without will, and entirely absorbed in a cognition which has no object. Notwithstanding its inactivity, it stimulates the material body-consciousness complex into will, emotion and the knowledge of definite objects. Since to the Indian mind the notion of consciousness is inseparable from that of pain, the union of soul and body in life is by its very nature painful, so that the purpose of philosophy is to interrupt the continual imprisonment of the soul in one body after another. As has been said, the Sankhya philosophy maintains that when the distinction between the psychical and the material is clearly envisaged throughout the universe, this distinction becomes a real distinction as well as a conscious one, and the soul lapses into the unconsciousness of a trance.

It will be seen that the Sankhya philosophy gives an explanation of the world-processes which conforms rather to the mechanical than to the teleological type. Accordingly, this school has no need for the *Deus ex machina* employed by the other doctrines of India. It is therefore known as 'the atheistic doctrine.' The Yoga philosophy (q.v.) differs from the Sankhya in little but the belief in a Deity. Consult Ballantyne's translation of the *Sankhya-pravachana* of Kapila; Davies' translation of the *Sankhya-kārikā* of Iśvarakṛishna; Grabe, R., 'Sankhya Philosophie' (Leipzig 1894); id., 'Sankhya und Yoga' (Strassburg 1896); Saint Hilaire, B., 'Mémoire sur le Sankhya' (Paris 1852); Roer, E., 'Lecture on the Sankhya Philosophy' (Calcutta 1854).

SANNAZARO, sän-nād-zä'rō, **Jacopo**, Italian poet and epigrammatist, descendant of a noble family of Spanish origin: b. Naples, 28 July 1458; d. there, 27 April 1530. After study under Pontanus, he was admitted to the Arcadian Academy as *ACTIUS SYNCERUS*, the name he selected to be known by, according to the prevailing custom. He spent several years in foreign travel and on his return to Naples soon became famous as a poet and courtier. His verse attracted the attention of King Ferdinand and his sons Alphonso and Frede-

rick. The last named when he ascended the throne as Frederick III in 1496 gave him the villa of Mergellina with a pension of 600 ducats. In 1501, when Frederick was forced into exile by Louis XII, Sannazaro accompanied him and remained with him until his death in 1504. During this period he completed his famous 'Arcadia,' a pastoral poem published in 1504, which passed through 60 editions before the close of the 16th century, and was largely imitated. His subsequent works include 'De partu Virginis' (1526), a Latin poem which earned him the title of the "Christian Virgil"; and his collected 'Sonetti e canzoni' (1530). His elegance of expression, no less than the poetical beauty of his thoughts, give him a distinguished place among the Latin poets of the Renaissance, and despite some adverse criticism, his 'Arcadia' still retains its reputation. See *ARCADIA*. Consult Colangelo, 'Vita di Jacopo Sannazaro' (Naples 1819); Carrara, E., 'La poesia pastorale' in 'Storia dei generi letterari italiani' (Milan 1908); Scherillo, M., 'Arcadia di Jacopo Sannazaro' (Turin 1888).

SANSEVIERIA, sän'sëv-ī-ē'rī-ā, a genus of plants of the family *Liliaceae*, of tropical Africa and the East Indies, named in honor of the Prince of Sansevero, a Neapolitan. It includes tender foliage plants useful in window gardening, since much sunshine is not necessary for their welfare, and they are easily propagated by division or leaf cuttings. The sansevierias have thick rootstocks, bearing tufts or rosettes of rigid, sometimes stem-like leaves, from one to four feet long; and, in the species cultivated in America these are sword-shaped, terete or oblanceolate, dark-green and banded more or less with grayish-white. The flowers have long and slender perianths, are white, and clustered among dry bracts in a dense raceme, rising from the centre of the group of leaves on a tall naked stalk. Bowstring hemp, used in India, is the long, durable fibre, also called Moorva and Marool, which is obtained from the East Indians *zeylanica*.

SANSKRIT is the literary high speech of India from the beginning of its historical tradition to the present day. A dozen or more languages or linguistic groups (Iranian, Greek, Italic, Celtic, Teutonic, Balto-Slavic, etc.), in close relation with Sanskrit, constitute the so-called Indo-European family of languages. Of these Sanskrit is the oldest and best preserved member. Together with the Iranian (Persian) and Scythian, it makes up the Aryan subdivision of the Indo-European family. This is the settled, scientific use of the term Aryan; but Aryan is widely and confusingly used in popular writings as the equivalent of Indo-European.

Certain cuneiform inscriptions of Western Asia (Mitani and Hittite) exhibit proper names which are clearly Aryan. They are dated at about 1500 B.C. The date at which Aryan clans began the occupation of Hindustan is unknown, but may for inner reasons be assumed to be no later than 1500 B.C. From that time on to the present day, that is, during a period of roundly 3,500 years, some form of Sanskrit has been the main instrument of Hindu literary, religious or cultural expression.

The name Sanskrit is used in a double sense, one general, the other more particular. In its

general sense it refers to the entire history of the highest speech form of India, beginning with the earliest period of the religious hymns of the Veda, to the present day. In this sense it is to be compared with Latin in which the language of the 12 tables, of Plautus, Livy, Saint Augustine, or Thomas Aquinas represents, in spite of much change, phases of one and the same language. In this sense, too, Sanskrit is contrasted with "Middle-Indic," the so-called Prākṛit dialects (Pāli and Prākṛit), which represents a secondary speech development, closely analogous to that of the Romance languages out of Latin. Like Romance, Prākṛit, in distinction from all forms of Sanskrit, represents popular languages, differing considerably from one another according to time and place; like Romance, Prākṛit shows extensive phonetic and morphological changes, often curiously alike in the two fields; and like Romance, Prākṛit dialects, such as Pāli (the language of the canon of the Southern Buddhists); the Prākṛit used by the sect of the Jainas; the Māhārāṣṭrī, etc., attained in various periods the character of literary languages. Middle-Indic appears for the first time in the earliest Hindu inscriptions, namely those of the famous Buddhist Emperor Aśoka, in the middle of the 3d century B.C., where these dialects show themselves in already differentiated forms. About 1,500 years later the Middle-Indic dialects develop into the modern languages of India, such as Hindi, Bengali, Penjabi, Guzarati, Marathi, etc., some of which in their turn, blossom out into literary languages of no mean quality. Thus Sanskrit as a whole holds the position of mother to the Middle-Indic, grandmother to the modern languages of India.

But the term Sanskrit is used also in a narrower, technically more correct sense. The early language of the Veda does not, curiously enough, designate itself by any name. The grammarians of the classical language speak of the sacred Vedic language as *chandas*, "metre," referring to the metrical Vedic hymns, and contrasting that language with the later language of secular literature as *bhāṣā* "speech." Now this sacred language is practically restricted to the books of the Veda; it is therefore spoken of either as Vedic, or hybridly, as Vedic Sanskrit. The term Sanskrit does not appear until after the time of the great Epic (Mahābhārata). It is an academic term coined by the grammarians (Pāṇini and his followers), whose activity ended in the 2d century B.C., for the language of the classical and secular literature which developed after the time of the Epic. The term *saṃ-skṛta* means "formed," and refers, strictly speaking, to the grammatical processes assumed to underlie the formation of words (*saṃ-skāra*). Yet the language of the Epic and other post-Vedic literature, such as the 'Polity Book' (Arthaśāstra) of Kautilya or Cānakya, written about 300 B.C., are so close to the Sanskrit of the grammarians, as properly to be included in that term. This then is what is called Classical Sanskrit, or Sanskrit for short. For more than 2,200 years, until the present day, Sanskrit has always led a more or less artificial life, and has always been encroached upon by more popular speech forms descended from it (Prākṛits and modern languages). Nevertheless, it has during all that

time dominated the culture of India, and remained its paramount expression in literature. Even at the present time Sanskrit is not quite a dead language in the sense in which Latin is a dead language among scholars or clerics; or Hebrew a dead language with the Jewish Rabbis. More spontaneously and extensively Hindu pandits, kings and ministers still speak or hold learned disputations in that language, or compose good Sanskrit poetry and prose. And there is plenty of evidence that in earlier times, say around 1000 A.D., Sanskrit was not only spoken by literary and scientific men, but was spoken or understood widely by cultivated people, both men and women. The grammarian Pāṇini states rules for Sanskrit which can apply only to spoken language, and the grammarians in general testify to dialectic differences in the Sanskrit of different parts of India which, again, means spoken language. In the second half of the 11th century the poet Bilhana tells that in the capital of his native Kashmir even women could speak both Sanskrit and Prākṛit. Other writers present the same similar testimony. In the Sanskrit drama men of superior station: kings, ministers, generals and Brahmins, speak Sanskrit; the rest of the men and the women, Prākṛit, making the dialogue bilingual. Those who did not themselves speak Sanskrit must, therefore, at least have understood it.

Though Sanskrit in the broader sense of the highest speech of India is a single language from the beginning to the end it by no means passes through its long history of about 3,500 years without change. The language of the Vedic hymns differs from classical Sanskrit about as much as the Greek of Homer does from Attic Greek. The apparatus of Vedic grammatical forms is richer and less definitely fixed than that of classical Sanskrit, which has given up many forms of the earlier language, without, as a rule, supplying proper substitutes. The subjunctive is lost; a single infinitive takes the place of about a dozen very interesting Vedic infinitives. Classical Sanskrit also has given up the most important single heirloom which it brought with it from prehistoric times, namely, the Vedic system of accentuation, which in classical times is swept off by a totally new mode. For all that Vedic, though at most points richer in form and less settled in character, is not a popular dialect, but a more or less artificial high speech handed down by generations of priestly bards. Thus both Vedic and classical Sanskrit are languages adapted to literary use by the cultured classes of their respective times. But the extent and conscious purpose of that regulation differs widely in the two phases; the handling of classical Sanskrit by Pāṇini and his followers went beyond any academic attempt to regulate speech recorded in the history of civilization.

An older linguistic time, lying behind the Veda, is still quasi-historical, though it can be reconstructed only by the aid of comparative philology. The Vedic people were immigrants to and conquerors of India; they came from the great Iranian region that stretches from the other side of the Himālaya Mountains almost as far as the Mediterranean. The comparison of Vedic (and to a lesser extent Sanskrit) with the oldest records of Iranian speech, the Avesta, and the cuneiform inscriptions of the Achemeni-

dan Persian kings, yields the startling result that these languages are collectively mere dialects of the same older idiom. This is known as the Aryan or Indo-Iranian. The reconstructed Aryan language differs less from the language of the Veda than Classical Sanskrit does from Pāli and Prākṛit. The language of the Avesta is so much like that of the Veda that entire passages of Avesta may be converted into good specimens of Vedic by merely eliminating the special sound changes which Avestan has evolved in the period of its separate existence. And the literary style, the metres; and above all the names of the mythologic persons in Veda and Avesta are enough the same to make the study of either to some extent dependent upon the other. In fact the spiritual monuments of the Avesta as well as the stone monuments of the Achemenidan kings became intelligible chiefly by the aid of Sanskrit.

The Sanskrit language regarded by itself is the most important and most highly organized of human languages. In verb inflection, for instance, it shows a larger number of categories than any other; there are some 14 varieties of expressing various shades of continuous verb kind (the so-called "present-systems"); it has imperfect, perfects, more than half a dozen aorists, futures; it has indicative, subjunctive, injunctive, optative and other mode classes; it has active, middle and passive voices. The so-called secondary verb kinds are abundant in variety and indefinitely productive; intensive, causative, desiderative and denominative. In the noun it shows seven cases and a wealth of differentiated noun stems unequalled by any other language.

From the comparative point of view Sanskrit is the oldest sister (not the mother) in the Indo-European family of languages, the most widespread, the most enduring, and historically the most important family of languages. Since the revival of classical learning there has been no event in the history of culture as important as the discovery of Sanskrit in the latter part of the 18th century. There is at present no domain of historic or linguistic science untouched by the influence of Sanskrit studies. The study of this language opened up the primitive Indo-European period, and originated the science of comparative philology in all its bearings. Linguistic science, comparative grammar, comparative mythology, science of religion, comparative jurisprudence and other fields of historical or philosophical study, either owe their very existence to the discovery of Sanskrit, or were profoundly influenced by its study. See LANGUAGE, SCIENCE OF; PĀLI LANGUAGE AND LITERATURE; PRAKRIT; RIG VEDA; VEDIC LITERATURE.

MAURICE BLOOMFIELD,

Professor of Sanskrit and Comparative Philology, Johns Hopkins University.

SANSKRIT LITERATURE. Sanskrit is the Anglicized form of *saṁskṛtā* (from *sa-*, a preposition of intensifying force in compounds, and the root *kr* "to make," cognate with Latin *creare*, "the adorned" or "perfected," that is, "speech"). It is employed to designate the second period in the literary development of the Aryans in India. For the first period, see VEDIC.

Distinction of the Two Periods.—The difference between Vedic and Sanskrit literature is not merely one of time, but extends to matter, spirit and form. The literature of the first period is religious, that of the second in spite of a marked tendency to moralize is profane. The purpose of the first period is practical, its primary object being to obtain happiness in this world. The second period in consequence of the doctrine of transmigration is filled with the idea of the misery of all existence, and its purpose is artistic, to satisfy an intellectual want. As the literature of the first period was practical, a natural prose style had been developed in the Brāhmanas. The artistic purpose of the second period led to the almost total abandonment of prose in favor of verse, often to the detriment of subjects requiring exact treatment, for example, the law. Prose when employed is either mingled with verse as in parts of the epic, the drama, fairy tales and beast fables; or so artificial as in the *kāvya*s or prose romances, that conform to the rules of poetics; or so awkward and obscure, as in the grammatical and philosophic treatises, as to be hardly worthy of being called prose.

Striking as these differences are, they are in reality less important than the less obvious changes that have taken place in the language. Hence it is quite appropriate that, while the first period is named from its literature, the second is named from its language—the Sanskrit.

Development of the Language.—The difference between the language of literature and that of everyday life is always of cardinal importance, but nowhere is it more strongly marked than in India. That it existed even at the time of the composition of the hymns of the Rig Veda is unquestionable. The language in which the "hieratic" hymns are composed is no spoken language, but an artificial dialect that was transmitted from generation to generation in the families of the priestly singers. This is shown by the fact, that in spite of varying authorship, there is nothing like dialectic variation within this class of hymns. It is evidenced also by the way in which forms of different periods appear side by side; by the unthinking repetition of phrases; by incorrect uses of words and forms; by false formations and by the way in which the necessities of the metre are allowed to determine the choice of synonymous forms. The language of the priests themselves may have approximated to this type with the omission of the most archaic and poetic elements; but the language of the masses of the people must have been very different. Positive proof of this is afforded by the fact that some words in the Rig Veda show already the phonetic peculiarities that are characteristic of the mediæval dialects. Such words must have originated in the language of the lower classes and thence made their way into the literary language. They show that the language of the lower classes had already advanced far in its development. The differences between this hieratic type of language and that of the popular hymns have generally been interpreted as due to differences in time; and attempts have been made to assign the different hymns to different periods on this basis. It has recently been shown, however, that the forms that have

been considered evidences of later date are frequently prehistoric and hence, certainly, as old if not older than the forms of the hieratic language; and that the language of the popular hymns is not a continuation of the language of the hieratic hymns, but that we have in these types parallel dialects, whether their difference be geographical or, as seems more probable, due to their employment by different social strata. The language of the Brāhmaṇas and Sūtras again is a continuation of neither of these types, but must be considered as an adaptation to literary purposes of the language spoken by the Brahmans at the time and place of their composition, under the influence of the literature that already existed.

Finally, there was fixed in the grammar of Pāṇini a type of language closely related to that of the Sūtras. This eminent grammarian from the northwestern part of India, whose date may be assigned to the 4th century B.C., represents the culmination of the grammatical studies that had their beginnings in the Brāhmaṇas. Of predecessors he mentioned no less than 64; but the success of his grammar has led to the disappearance of their works. His grammar became the standard for the classic language so absolutely, that from this time the language is fixed—there being no further development of language but only of style. This language is called the Sanskrit, that is "the adroned" or "perfected" in opposition to the Prākṛit or plebeian dialects. That it was not the pure creation of the grammarian's brain but based on actual spoken usage is evident; for some of the rules of his grammar would have no significance except for a spoken language, and there are early traces of dialectic variation. We are expressly told that in the 2d century B.C. the inhabitants of the Āryāvarta or "land of the Aryans" that is the country between the Himālaya and the Vindhya Mountains, were the speakers of the standard Sanskrit. But this does not apply to all the inhabitants of that district. The distribution of the dialects in the drama probably continues a much earlier tradition; here men of the two upper castes speak Sanskrit, those of the lower castes and all women speak Prākṛit. As all converse with one another, and the production—the same applies to the recitation of the epics—must have been intelligible to the audience it follows that Sanskrit must have been intelligible even to those who did not speak it, and that its speakers must have understood also the vernaculars. Its position must have been like that of Latin in the Middle Ages or that of Hebrew among the Jews and such is its position in India at present. In it the whole of the classic literature is composed, so that we have the spectacle of the literature of a nation under the domination of a single grammar for centuries, in a way that is without parallel in the history of the world. This language and literature spread throughout the Indian peninsula and further south to Ceylon, to Borneo, Java and the Philippines into further India, Burma and Siam, and, owing to the influence of Buddhism, into central Asia, Tibet, China and Japan.

With regard to the differences between the classic language and the various forms of Vedic it is to be noted that the phonetic status of the language has remained almost exactly the same,

that there has been no important addition to the formative or inflectional elements, but that the change has consisted partly in dropping forms that seemed superfluous, partly in settling the usage in favor of one form, for which two or more forms of synonymous value had previously existed; and finally that the vocabulary has been increased by new formations made with the means that were already at hand. The nature of these changes also shows that we are dealing with a literary language. The natural development of the language of the Aryans in India is to be seen only in the speech of the lower classes. The existence of these vernaculars by the side of the literary language is attested, as has been noted, from the time of the Rig Veda. In literature they appear only with the rise of the two great heresies Jāinism and Buddhism. These in their oldest phases employ the Prākṛit and Pāli dialects, afterward they too resorted to Sanskrit, so that Prākṛit remained in literature only in certain parts of the drama in which it had a traditional right. From these mediæval dialects were evolved in turn the modern dialects, the literary employment of which begins about the 11th century of our era.

Sanskrit Literature.—By Sanskrit literature is meant, therefore, the literature which is composed in the language that conforms to the grammar of Pāṇini. Certain parts of the Epics are no doubt older than that grammar, but it is impossible to tell exactly which these parts are, and moreover in the later working over of this material the tendency has been to bring it into harmony with the classic standard. It will be seen, therefore, that there is no sharp chronological line that can be drawn between the two periods; because on the one hand the beginnings of the classic literature go back to the time before Pāṇini and on the other the later monuments of the Vedic literature were produced after that date. The wealth of the classic literature is enormous, every department except history being well represented and it will not be possible to give more than the briefest mention of the most important authors and works.

Epic Poetry.—Two classes of works are to be distinguished: Itihāsas, Ākhyānas or Purāṇas, "ancient tales," and the Kāvya or artificial epics. The chief representatives of each are the Mahābhārata and the Rāmāyana. The first is a heterogeneous mass of about 100,000 distichs. The main story is the strife of two Aryan tribes, the Kurus and the Pañcālas. To this only about one-fifth of the poem refers. The remainder consists of episodes and didactic disquisitions chiefly on the duty of the warrior class that have changed the poem from an epic to a dharmacāstra or legal textbook. The Mahābhārata itself recognizes the nature of its origin, when it gives as its author Vyāsa, "redactor." It is known to have reached its present form by 500 A.D. and probably had become a dharmacāstra by the beginning of our era, while the epic nucleus may be some five centuries earlier than that date. The 18 Purāṇas that have been preserved are of much later date. Their original character has been changed by abridgment or omission of the ancient tales and the substitution of didactic elements. They are all sectarian, generally Viṣṇuite. The Rāmāyana, a poem of some 24,000 distichs, is for

the most part the work of a single poet Vālmīki. Its subject is the story of Rāma, especially the abduction of his wife Sītā by the demon Rāvana who carried her to his stronghold Laṅkā in Ceylon, from which she was rescued by Rāma with the help of Hanuman, king of the monkeys. In the later additions Rāma is made into an avatar of Viṣṇu. The story has been interpreted as an historical allegory but is more probably merely mythological. The main portion of the work is probably older than the formation of the epic kernel of the Mahābhārata. The Kāvya, or artificial court epics, extant range from the time of Kālidāsa (the beginning of the 5th century) to the 12th century, though there is epigraphic evidence to show that this style of poetry originated before our era and continued in vogue. Of these the most important are the Raghu-vaṅṣa, 'The Family of Rāma' and the Kumārasambhava, 'Birth of the Wargod,' of Kālidāsa. As Kāvya are also classed certain prose romances of the 6th and 7th centuries—the best known being the Daśa-kumāra-carita of Daṇḍin or 'the Adventures of the Ten Princes.'

Lyric Poetry.—Long lyric poems are rare. Such are Kālidāsa's Meghadūta, or 'Cloud Messenger,' in the 115 stanzas of which an exile implores a cloud to bear to his wife the message of his love; and the highly poetical description of the seasons from the point of view of a lover, by the same poet entitled Ritu-saṁhāra, 'Cycle of the Seasons.' More frequently each stanza is a poem in itself: these are published in collections frequently styled Āṭakas, 'Centuries.' Religious lyric poetry is represented by similar collections. Famous in both departments was Bhartṛhari (of the 7th century).

Drama.—This is the department in which Sanskrit literature has reached the highest point of merit. Noteworthy are the resemblances to the Elizabethan drama, the absence of tragedy, the mixture of prose and verse, and the employment of different dialects, mentioned above. The origin of the drama is obscure, but there is no reason to assume Greek influence. Etymology points to the original prominence of dancing. Combined with song and pantomime it constitutes the germ from which by the addition of the dialogue—at first extemporized—the drama was evolved. The first and greatest of the dramatists is Kālidāsa and his masterwork is the Ākuntalā. Besides this have been preserved the Vikramorvaṣi and Mālavikāgnimitra. Bhavabhūti of the 8th century is the next in fame: of his works remain, the Mālatī-mādhava, Mahāvīra-carita and Uttara-rāma-carita. Between these in time are the Mṛcchakatikā, 'Clay Cart' and the Ratnāvalī, 'Pearl Necklace,' attributed to the kings under whose patronage they were brought out.

Fairy Tales and Fables.—This department is historically most interesting because of its deep influence upon the mediæval and modern literature of Europe. Characteristic is the human-like rôle assigned to the animals; the mingling of prose with poetry of a gnomic character and frequently of a high order of merit; and the system of arrangement, story being set in story as in Arabian Nights. The source of the beast fables is the Jātakas or Buddhist birth stories, the chief character being identified with Buddha in a previous existence. Works of this class are called Nīti-śāstras or

'Text-Books on Good Behavior,' being intended for the political and ethical training of princes. They have been recast by the Brahmans in the interests of their religion. Of these the oldest is the Pañca-tantra, so called from its five books. Its existence in the 6th century is proved by its translation at that date into Pehlevi. From it chiefly is derived the Hitopadeśa, 'Book of Good Counsel,' the manuscripts of which go back to the 14th century. The most important collection of fairy tales is Somadeva's Kathā-sarit-sāgara, 'Ocean of the Streams of Stories,' of the 11th century.

The works of Sanskrit literature relating to the sciences and arts, grammar, lexicography, metrics, poetry, rhetoric, philosophy, law, astronomy, mathematics, medicine, music, painting, sculpture and the technical arts, cannot come within the scope of this article. For works of reference, see under VEDIC.

GEORGE MELVILLE BOLLING,
*Professor of Greek, Ohio State University,
Columbus, Ohio.*

SANSOVINO, sän-sō-vē'nō, **Andrea**, Italian sculptor: b. Monte San Savino, near Montepulciano, 1460 (whence he was familiarly known as SANSOVINO, his real name being CONTUCCI); d. 1529. He was a pupil of A. Pollaiuolo, and early formed his style on that of Leonardo da Vinci. It was under their influence that he produced such reliefs as the 'Coronation of the Virgin'; 'The Annunciation,' and the 'Pietà.' In 1491 he was summoned by the king of Portugal to Lisbon, where for nine years he exercised his art as sculptor and architect. Returning to Florence in 1500 he carved the group of 'Christ's Baptism' over the east portal of the Baptistery, which exhibited a nobility of form and expression unparalleled at that period, although he never completed the group. A statue of the Madonna and one of John Baptist for the cathedral at Genoa were his next works, and afterward he accepted a commission from Pope Julius III to execute the tombs of Cardinals Basso and Sporza for the choir of Santa Maria del Popolo. In these sepulchral monuments we see that the high-water mark of the 15th century art is reached; they are the most masterly sculptures of their kind that Rome possesses. In 1512 he completed his 'Saint Anne with Two Other Saints' in the church of San Agostino in Rome. He was then entrusted by Pope Leo X with the decorations of the church at Loreto (1513-29). Among the reliefs there the 'Annunciation'; the 'Nativity'; and the statue of 'Jeremiah' are his own works; the rest of the decorations were produced under his direction by various artists. Nothing can be finer than the blending of classic severity with the freshness of Renaissance life in these figures which exhibit the results of a pure study of nature. Expression and action are full of deep feeling, yet not so emphasized as to overstep the line of modesty.

SANSOVINO, Jacopo Tatti, Italian sculptor and architect: b. Florence, 1479; d. Venice, 27 Nov. 1570. He took his name from the great artist who had been his teacher, and began his career in Florence where his first works of note were his statue of 'Jacob' in the cathedral and his marble 'Bacchus' in the Bargello. Belonging also to this early period is a 'Madonna

and Child' in the church of San Agostino at Rome. In 1527 he went to Venice where his genius being quickly recognized he was appointed architect to the republic. His untiring labors from that time to his death have left his stamp both on the sculptural and architectural monuments of Venice. He is a brilliant example of the Italian artists in the noonday splendor of the Renaissance and in his architectural creations unites play of fancy and elegance of proportion with the most impressive and monumental dignity. His pre-eminence as a sculptor is not so evident; his plastic work is often unpleasing and evidences a failure to master either the principles or the materials of his art, so that his work appears mannered and mechanical. His greatest successes in architecture are the 'Corner Palace' (1532); the library of Saint Mark's, a splendid example of Italian Renaissance (1536); the Mint; and the churches of San Martin, San Giorgio dei Greci and San Giuliano. The 'Burial of Christ' and the 'Resurrection,' are fine reliefs on the bronze doors of the sacristy of Saint Mark's, and among other plastic works of his are a sitting figure of 'Saint John' in Santa Maria dei Frari; the statues of 'Hope' and 'Love' on the tomb of the Doge Venier in San Salvatore; and the gigantic figures of 'Mars' and 'Neptune' in the Doge's palace. Consult Rosenberg in Dohme's 'Kunst und Künstler.'

SANTA ANA (sān'tā ā'nā) **INDIANS**, a Pueblo tribe of New Mexico. See **KERESAN**.

SANTA ANA, Cal., city, county-seat of Orange County, on the Southern Pacific and the Southern California railroads, 30 miles southeast of Los Angeles. It was founded in 1869. It is the commercial centre of Santa Ana valley, on the most fertile sections of California; oranges and fruits of all kinds, vegetables, wheat and sugar beets are produced in this region, and there are also large peat-beds in the vicinity. The principal industries include a fruit and vegetable cannery, flour mills, large lumber and planing mills and soda-works. Santa Ana is connected by a local railway with Newport Beach, 10 miles distant, a popular seaside resort. There is a public high school, established in 1889, and a public library; the Orange County Business College is also located here. The city owns its waterworks, the supply being derived from artesian wells. Pop. 8,500.

SANTA ANA, Salvador, city and departmental capital, 50 miles by rail northwest of San Salvador and the Pacific port of Acajutla. It is a well-built city, the second in size of the republic, and lies about 2,100 feet above sea-level, in a mountain-encircled valley, abounding in coffee and sugar plantations, and forests. The Doric church, municipal building, hospital and military barracks are the principal buildings. There are numerous manufactures of domestic commodities and an active export trade in coffee and sugar, which increased considerably after the railway reached the city in 1900. Pop. 48,200. In the vicinity is the source of the Santa Ana River a tributary of the Lempa; and Santa Ana 8,300 feet high, the loftiest volcano in the republic, rises nearby.

SANTA ANA, Philippines, formerly a pueblo of the province of Rizal, constituted a district of the city of Manila in 1902. It is the

centre of extensive vegetable gardening for Manila markets. Pop. 2,200.

SANTA ANNA, sān'tā ān'nā, or **ANA, ANTONIO LOPEZ DE**, Mexican general and politician: b. Jalapa, 21 Feb. 1795(?); d. Mexico City, 20 June, 1876. He entered the army at 15, and attained public prominence as a supporter of Iturbide in 1821. The following year, after having expelled the royalists from Vera Cruz, he took command in that city, where he led a revolt (2 Dec. 1822), which hastened the retirement of Iturbide, who had made himself emperor. After the defeat of the Federal party in 1822 Santa Anna retired to his estate; but he emerged again in 1828 in support of Guerrero's claims to the presidency, in which the latter supplanted Pedraza. In 1829 the Spanish invasion furnished Santa Anna a favorable opportunity, and as minister of war and commander-in-chief at the head of the Federal forces he compelled Barradas to capitulate at Tampico, 11 September. He soon joined with Bustamante in overthrowing Guerrero, and setting up the former in his place, but also, in 1832, led in the overthrow of Bustamante himself, and the restoration of Pedraza. In 1833 Santa Anna was chosen President, and soon after renounced the party of the Federalists and put himself at the head of the Centralists, who desired the centralization of power in the executive government. His popularity with the army was not shared in by the nation at large, which feared that he was aiming at imperial power. On 11 May 1835 he defeated an insurgent army on the plains of Guadalupe, and as the blow was fatal to the Republicans he was shortly afterward named dictator. The Federal Constitution was abolished and the governors of the several states became dependent upon the central power. Texas, however, having long nourished a revolutionary feeling, now broke out into rebellion. Santa Anna attacked San Antonio in February 1836, stormed the Alamo (q.v.), and massacred its defenders, 6 March, and going forward pursued the Texans under Sam Houston (q.v.), by whom, however, 21 April, at the battle of San Jacinto (q.v.) his forces were routed and himself taken prisoner. He secured his release by a treaty recognizing the independence of Texas, which, however, was repudiated by Mexico, that country also suspending his dictatorship. He was permitted to go to the United States, and after his return to Mexico in 1837 lived in retirement for a year, but offered his services to his country against the French in 1838, and taking command of the troops, repelled the assault on Vera Cruz (5 December) and forced the enemy to retire. In this engagement he lost a leg, a casualty which, however, contributed to restore him to popular favor. He again became a leader of the Centralists, and from October 1841 to June 1844 was virtual dictator under the title of President. The new Constitution of 12 June 1843, under which he was formally elected President, increased his dictatorial powers, the exercise of which led to a fresh revolution, resulting in his overthrow. He was taken prisoner in January 1845 and banished. But on the eve of the war with the United States, he was recalled (July 1846), and was first appointed generalissimo by the provisional government and in December was made provisional president. At the open-

ing of 1847 he led an army of 20,000 against the American troops under General Taylor, and fought the battle of Buena Vista (q.v.) 22-23 February, in which he was defeated. On 18 April he was attacked and defeated at Cerro Gordo (q.v.) by General Scott. Immediately after the battle of Chapultepec (q.v.) the City of Mexico fell and was entered by the Americans (14 September). Santa Anna, escaping from the city, briefly continued a desultory warfare; but on 5 April 1848, having resigned the presidency, he received permission to retire from the country and sailed for Jamaica, going thence to Venezuela. In 1853 he was recalled and elected President for one year, but after setting up an odious despotism, he proclaimed himself (December 1853) President for life, with the title of Serene Highness and the right of nominating his successor. Revolution followed in March 1854, and when he saw that his cause was lost Santa Anna fled from the capital (9 Aug. 1855) and found refuge in Cuba, Venezuela and Saint Thomas. In this absence he was tried and condemned for treason, and his estates were confiscated. He returned to Mexico during the French occupation (1864), but was not permitted to remain. In 1867 he again returned, but was once more exiled and went to live in the United States. Finally, after the death of Juárez and the amnesty of 1874, he was permitted to reside in his own country, where his career ended in poverty and obscurity. Consult Wilson, 'Mexico' (1856). See MEXICAN WAR; MEXICO; TEXAS.

SANTA BARBARA, bār'ba-rā, Cal., city, county-seat of Santa Barbara County, on Santa Barbara Channel, an arm of the Pacific Ocean; and on the Southern Pacific Railroad, about 360 miles southeast of San Francisco. It has regular steamer communications with San Francisco, San Pedro, San Diego, and other Pacific ports. The Santa Ynez Mountains shelter the city from the north winds, and the ocean breezes serve to make the temperature equable and salubrious all the year. The number of health seekers who visit the place in winter has given it the name "American Mentone." It was visited, in 1603, by Sebastian Vizcaino. In 1782, Governor Felipe Neve established a presidio which was maintained until the arrival of General Frémont. Among the earliest white settlers were Andrew, John and Thomas McDonnell of County Galway, Ireland, who for many years maintained the greatest sheep ranches of the West in Santa Barbara County. Santa Barbara is in a remarkably fertile agricultural region. It raises large quantities of beans, chiefly limas, and large quantities of English walnuts. Probably a thousand carloads of walnuts are marketed from this county yearly. In the northern portion of the county there are many oil wells, some yielding as many as 3,000 barrels daily. In the vicinity are mineral springs, from which many hundred thousands of bottles of Veronica and Bythinia waters are shipped. Santa Barbara is noted for the quality of the lemons shipped from its confines.

The education establishments of the city include the State normal school located on a high hill just north of the city, and a high school with an attendance of 450 pupils. It has the usual grade schools. The Saint Francis Col-

lege, conducted by the Order of Saint Francis, has two fine buildings and some hundred students in collegiate work. It has a faculty of much more than ordinary ability. The parochial school of the parish church at Santa Barbara is excellently conducted, and gives to the children of Catholic parents an opportunity to have their children educated within the pale of the Church. The four banks within the city have a combined capital of \$1,000,000, and deposits of \$5,000,000.

The Old Mission founded by the immediate successor of Junipero Serra is situated just without the city limits. The building was built in 1815, and upon the ruins of the former mission established in 1786. Montecito is situated to the east of Santa Barbara and is a suburb of that city. In this locality famed the world over for its beauty are hundreds of beautiful homes. Many of them are works of art. Pop. about 17,000.

SANTA BARBARA, Honduras, the capital of the department of Santa Barbara, situated on the Santa Barbara River, 65 miles southwest of Puerto Cortés. It is a comparatively well-built town, manufactures sombreros and spirits, and is a commercial depot for the products of the surrounding country destined for Puerto Cortés. The latter is reached by a high-road and, for a part of the way, by rail. Pop. between 5,000 and 8,000. Also a town on Samana Peninsular, San Domingo. Pop. 5,000.

SANTA BARBARA, Philippines, pueblo, province of Iloilo, island of Panay, between a branch of the Janipaan River on the north and the Tigón River on the south, 12 miles north of Iloilo, the provincial capital. Pop. 13,000.

There is also a smaller pueblo of the same name, province of Pangasinán, Luzon, 12 miles east of Lingayén; at the crossing of two roads. Pop. 7,595.

SANTA BARBARA, a channel in the Pacific Ocean, between the northern islands of the Santa Barbara group and the mainland of California. It varies in width from 20 to 30 miles.

SANTA BARBARA ISLANDS, a group off the coast of California, lying 20 to 60 miles from the mainland, south and southeast of Santa Barbara city. They are nine in number; San Miguel, Santa Rosa, Santa Cruz, Anacape, Santa Barbara, Santa Catalina (q.v.), San Clemente, San Nicolas and San Juan. From San Miguel on the north to San Clemente is about 155 miles.

SANTA BARBARA DE OCAMPO, dā ō-kām'pō, Mexico, a town in the state of Tamaulipas, situated 45 miles south of Ciudad Victoria. It lies in a fertile river-plain at the foot of the eastern Sierra Madre, and is the centre of a rice, sugar and fruit-growing district. Pop. about 10,000.

SANTA CATALINA, kā-tā-lē'nā, an island of California, one of the Santa Barbara Islands, separated from the mainland by San Pedro Channel and Gulf of Saint Catalina. The island was discovered in 1542 by Juan Rodriguez Cabrillo, a Portuguese explorer in the service of Spain, and was named by him San Salvador. The explorer Sebastian Vizcaino visited the island 60 years later and gave it the present

name, in honor of Saint Catharine of Sienna. The island is 25 miles long, with an average width of four miles; area, about 55,000 acres. It is hilly and well-wooded and has many deep gorges. Avalon (q.v.) is the only town on the island. The surrounding waters abound with fish. The island is a favorite resort, especially from June to October.

SANTA CATHARINA, *kā-tā-rē'nā*, Brazil, a southern maritime state bounded on the north by the state of Paraná, on the east by the Atlantic, on the south by the state of Rio Grande do Sul and on the west by the Argentine territory of Misiones; it includes the fortified island of the same name and several smaller ones on the coast; area, 28,620 square miles. Desterro officially Florianopolis, is the capital. A series of valleys run west to east, formed by spurs of the boundary mountain range, and the state is watered by the rivers São-Francisco, Aracary, Tapeçu, Tijuca, Tufarão and numerous streams all falling into the Atlantic. The headwaters of the Uruguay River are in this state. The soil, though in the lower lands sometimes sandy, is fertile, the climate mild and the seasons regular. Sugar, rice, mandioca, millet, beans, onions of immense size and garlic are the chief cultivated products, considerable quantities of which are exported to Rio de Janeiro. The indigo and cochineal plants grow luxuriantly, and wheat and flax give good returns. The state is well wooded, producing excellent timber; and gold, silver, iron, coal and petroleum exist. The forests are infested by ounces, coatis, monkeys, pigs and other animals. Birds are numerous, including several varieties of humming-birds, and the lakes and rivers are frequented by innumerable geese and other water-fowl. Pop. 320,289.

SANTA CLARA, *kla'ra*, Cal., town in Santa Clara County, on the Southern Pacific Railroad, 46 miles southeast of San Francisco. It was settled by the Franciscans in 1777, became a town in 1852, and received a new charter in 1867. It is the centre of a rich agricultural and fruit-raising region, and has a number of fruit-packing establishments; it also contains several mills, a tannery, sash and door factory, casket-works and a wind-mill factory. It is connected with San José, the county-seat, by a railroad and electric street railway. The public school system includes a high school and there is a public library. The town is also the seat of Santa Clara University, a Roman Catholic institution founded in 1851, and the Notre Dame Academy, a Roman Catholic convent school and the University of the Pacific (q.v.) is nearby. The Carmelite Order of Nuns occupy a magnificent monastery erected at a cost of \$250,000, founded by the late Alice Phelan Sullivan. The Black Company is the largest green-fruit packing industry on the Coast. The *Santa Clara Journal*, the semi-weekly newspaper, is the oldest publication in Santa Clara County. The old Santa Clara mission is of great historic interest. A fine boulevard, the Alamada, connects the town with San José. The government is by a board of five trustees, three of whom are elected two years. Pop. 4,348.

SANTA CLARA, Cuba, (1) city, capital of the province of Santa Clara, on the Cuba

Railroad, 155 miles east-southeast of Havana. It was founded in 1689. Formerly it was the eastern terminus of the railroad from Havana, but in 1902 the railroad system was extended to the eastern end of the island. It is the centre of a fertile agricultural region, is the second largest inland city of Cuba, and has considerable commercial importance, which is increasing with the development of the railroad facilities. Silver has been mined in the vicinity, but not successfully; an excellent quality of asphalt and graphite are obtained and exported; and illuminating gas for lighting the city has been manufactured from this asphalt; petroleum is also reported in the vicinity. The city is well built, the streets are wider than is usual in the older Cuban cities, and municipal sanitation has been improved since 1898. The location is naturally healthful and favorable for further commercial development. Pop. 54,885.

(2) Province in the central part of Cuba, bounded on the east by Camagüey and on the west by Mantanzas; area, 8,266 square miles. The surface is undulating, with ranges of hills in the east and south, the highest peak rising 2,900 feet. It has rich agricultural lands; the production of sugar is the chief industry, the province containing some of the largest sugar plantations and factories in the island. Tobacco, coffee and fruits are other products of commercial importance; wax and honey are obtained, and the timber is abundant and valuable, there being 307,910 acres of public forests in the province. There are also excellent grazing grounds and cattle raising is a profitable industry. The mineral resources are second only to those of the province of Oriente, but not so well developed; asphalt is mined, and copper, gold and silver have been located. The Cuba Railroad traverses the province from east to west and there are short branch roads; there are few good highways, however, and the need of improvement in transportation facilities is felt. Pop. 569,416.

SANTA CLARA, Order of. See ORDERS (ROYAL) AND DECORATIONS.

SANTA CLARA, University of, an institution for higher learning established at Santa Clara, Cal., on the site of the old Santa Clara Mission in 1851. It was incorporated as a university in 1875, but was known as a college until 1912 when the title university was assumed. Its courses comprise philosophy and letters; general science; civil, mechanical and electrical engineering; architecture; pedagogy; and a pre-medical course. It is Roman Catholic in denomination. There are 325 students and 34 instructors; the buildings and equipment are valued at \$720,000.

SANTA CLAUS, *sān'ta klāz*. See NICHOLAS, SAINT.

SANTA CROCE, *sān'tā krō'chā*. See FLORENCE.

SANTA CRUZ, *sān'tā kroos*, Andres, Bolivian soldier and politician: b. La Paz, Bolivia, about 1794; d. Saint Nazaire, France, 1865. He was of partial Indian descent, entered the Spanish army and rose to the rank of colonel. He was captured by the patriots in 1820, persuaded to adopt their cause, became a general in the army, and led an invasion of Upper Peru in 1823. In 1826-27 he was acting President of

Peru under Bolivar and in 1829 he was elected President of Bolivia for a term of 10 years, receiving also the title of grand marshal. His measures were progressive and the country enjoyed great prosperity under his administration. From the first he adhered to his purpose of uniting the Pacific Coast republics, and his successful invasion of Peru in 1836 was followed by his proclamation of the Peruvian-Bolivian confederation. In 1839 a Chilean army invaded Bolivia and defeated Santa Cruz at Yungay. He resigned and left the country, whereupon the confederation was dissolved. He was afterward engaged in Europe on various diplomatic missions for Bolivia.

SANTA CRUZ, Cal., city, county-seat of Santa Cruz County, on the Bay of Monterey, and on the Southern Pacific and South Pacific Coast railroads, 60 miles south of San Francisco. It was first settled in 1791 by Franciscan missionaries, and was incorporated as a city in 1876. It is in a fruit-raising region; the chief manufacturing establishment in the city is a powder factory; other manufactures of importance include lead, bitumen and leather; and there are also lumber and planing mills, a soap factory and a box factory. The city is beautifully situated on land rising gradually from the bay, the climate is equable and pleasant, and it has become one of the most popular health and tourist resorts of central California. A bathing beach, picturesque drives and a large public park overlooking the bay add to the attractions of the place. The public buildings include a courthouse, a hall of records, the city hall, and the public library. The city has a public high school and parochial schools; and is the seat of the School of Holy Cross (a Roman Catholic convent school), and of the Catherwood's Business College (coeducational). The city is governed on the commission plan. Pop. 14,038.

SANTA CRUZ, sãn'tã kroos, five Mexican towns bear this name, the largest being in the state of Guanajuato, situated in a fertile agricultural district a few miles southeast of Guanajuato, with a population of 7,239.

SANTA CRUZ, Philippines, pueblo, capital of the province of Laguna, Luzon; on southeast shore of the Bay Lagoon (Laguna de Bay), at the mouth of the Santa Cruz River, 34 miles southeast of Manila. It is connected by highway with Manila, Batangas, Cavite and Tayabas, and carries on an important trade. It is also the terminus of a projected railroad from Manila. The region is famous for the manufacture of palm wine or brandy, the sale of which was a government monopoly under Spanish rule. The town is well built and contains fine municipal and ecclesiastical buildings. Pop. 13,140.

There are also three smaller pueblos of the same name: (1) Pueblo, province of Davao, Mindanao, on Davao Bay, 15 miles south of Davao; it has an excellent harbor of good depth; pop. 720; (2) Pueblo, province of Ilocos Sur, Luzon, 34 miles south of Vigan; on the main highway; pop. 5,876; (3) Pueblo, province of Zambales, Luzon, on sea-coast; 32 miles north of Iba; on the main highway; pop. 4,600.

SANTA CRUZ, sãn'tã krooz, or **SAINT CROIX**, sãnt kroi, the largest of the Virgin Islands of the United States, lying 60 miles east by south of Porto Rico; area, 84 square miles.

It is hilly except in the southern part; well-watered, and fertile, and has a larger proportion of land under cultivation than the other islands of the group. Sugar is the chief product; tobacco, cotton and fruits are also cultivated. Some cattle are raised. The chief articles of export are sugar and rum. The climate is at times unhealthy, the temperature varies from 54° to 72°. Earthquakes and hurricanes are frequent. The capital and residence of the governor is Christianstadt; and in the island is another small town called Frederikstadt. The island was discovered by Columbus in 1493, and was occupied by the Dutch, the English, the Spaniards and the French; ceded to Denmark by France, it was occupied by the English in 1807, but finally restored to Denmark by the Treaty of Paris. It came into the possession of the United States by purchase 31 March 1917. Pop. about 16,000. See VIRGIN ISLANDS.

SANTA CRUZ ISLANDS, or **QUEEN CHARLOTTE ISLANDS**, Melanesia, an archipelago in the Pacific Ocean, belonging to Great Britain, and situated in lat. 10° S. and long. 166° E., north of the New Hebrides, and east of the Solomon Islands. The group comprises about a dozen small islands, with a combined area of 362 square miles. The larger islands are volcanic and mountainous. Most of them are surrounded by coral reefs, and nearly all the small islands are of coral formation. The climate is hot, humid and unhealthy, but the soil is very fertile, and the vegetation luxuriant. The inhabitants, who are chiefly Melanesians and still uncivilized, are supported partly by their plantations of coco-palms, partly by fisheries and by trading with neighboring islands. The archipelago was discovered in 1595 by Mendaña. Bishop Patterson was murdered there in 1871. Since 1893 it has been an administrative dependency of the Solomon Islands. The population is about 7,000.

SANTA CRUZ DE NAPO, krooth dā nã'pō, pueblo, province of Marinduque, Philippines, on the northeast coast, 18 miles east of Boac. The town lies about a mile and a half from the shore, and three miles from the anchorage ground. It is a port of entry for coasting vessels, and the anchorage is well protected; there is difficulty, however, in landing at the point nearest the town. Santa Cruz is surrounded by a fertile agricultural country; it is not as well built as Boac, the provincial capital, but its situation is more advantageous owing to the superior harbor. Pop. 15,800.

SANTA CRUZ DE LA SIERRA, kroos dā lã sē-ēr'rã, Bolivia, (1) town, capital of the department of Santa Cruz de la Sierra; on the Piray River, on the eastern slopes of the Andes. The town was founded in 1575, and originally bore the name of San Lorenzo de la Fontera. The houses are mostly one story high, built with timber and earth, with large balconies and uneven roofs. Pop. 18,335. (2) Department, the easternmost department of Bolivia, bounded on the north by department of Beni, and the Brazilian province Matto-Grosso; on the east by the river Paraguay and the Brazilian territory; on the south by the desert of Gran Chaco and Chuquisaca department; on the west by the department of Cochabamba; area, 126,340 square miles. It is mostly level, except in the western

part, where it reaches the Andes. It is drained by the Rio Mamore and the Rio Beni, and their tributaries. The central region is heavily wooded, with some open marshes and plains. It is thinly populated, the most of the towns being in the western part and along the rivers. The soil between the mountains and the central forests is fertile and yields sugar, coffee, cacao and rice. Some cotton cloth is manufactured and gold is mined in the mountain district. Pop. (estimated) 209,850.

SANTA CRUZ DE TENERIFFE, krooth dā tēn-ē-rif', Canary Islands, city, capital and commercial port of the Canary Islands, on the northeast coast of the island of Teneriffe (q.v.). Many of the houses are handsome, and of one and two stories high; but the majority are low. The streets are well paved, and lighted by electricity. There is a square, surrounded by wooden edifices, and adorned with a colossal statuary group representing the apparition of the Virgin of Candelaria to the Guanches, the original inhabitants. Besides the custom-house and the military hospital, there are scarcely any public buildings; the church of San Francisco is the finest. The harbor, which is very secure, has a magnificent mole, of modern construction; other works, including a breakwater, have recently been constructed. Tomatoes, bananas, potatoes, wine, brandy and cochineal are the chief articles exported; and the imports consist largely of English, French, Spanish and German manufactures, with coal, grain, flour, etc. Pop. 16,000.

SANTA FÉ, fā, or **SANTA FÉ DE LA CRUZ**, Argentina, (1) Capital of the province of the same name, near the junction of the Salado with the Paraná, 299 miles by rail northwest of Buenos Aires. It stands on an eminence which is prominent in a district otherwise level. The Cabildo, the most important building, stands on the plaza or main square. Santa Fé is the seat of the governor, legislature, and the bishop. There are several churches and monasteries, also a normal school for teachers. Hides and timber form the chief articles of trade. The principal industrial works are: a foundry, macaroni and oil factories, and tile works. Pop. 33,200.

(2) The province of Santa Fé covers 50,916 square miles, and has a rapidly increasing population. Rosario (q.v.) is the largest city. There are vast numbers of cattle, sheep and horses on extensive farms, and 3,688,118 acres of land are planted in cereals. Pop. 816,401.

SANTA FE (Holy Faith, contracted from **LA VILLA REAL DE SANTA FE DE SAN FRANCISCO**), New Mexico, city, capital of the State and county-seat of Santa Fe County, on the Santa Fe River, the Denver and Rio Grande, the New Mexico Central and the Atchison, Topeka and Santa Fe railroads; it is 21 miles east of the Rio Grande and 58 miles northeast of Albuquerque. Chartered as a city in 1890.

Principal Features.—The streets in the older part are narrow and crooked and are occupied chiefly with one-story adobe houses, but in the more modern portion the streets are broad and straight and are improved with good business houses and neat residences, many of them of stone and brick. A public park, known as the Plaza, occupies a square in the middle of the city, in which are two monuments and a

memorial fountain. The city contains also a monument to Governor Perez, who was assassinated in 1837, and another to Kit Carson who lived at Taos. Santa Fe is the seat of a Roman Catholic archbishopric and until 1897 the military post known as Fort Marcy was situated there. The city contains the oldest national bank in the State of New Mexico, and has a public high school and ward schools. In addition to the State library there are three public and school libraries. The rooms of the Museum of New Mexico, the School of American Research, and the New Mexico Historical Society contain interesting historical and archaeological collections, while the attractive new building of the Museum of New Mexico, constructed in the style of the New Mexico mission architecture, houses the art collection of the State. Santa Fe is beautifully situated at an altitude of 6,998 feet, in the midst of an agricultural and mining region and its principal business consists of supplying the immediately surrounding country with merchandise. Water for domestic purposes, for local irrigation and electric power, is supplied by reservoirs above the city on Santa Fe Creek. There are commodious hotels. Owing to its unsurpassed climate Santa Fe has become a popular resort for health-seekers and its deep historical interest attracts many tourists; but as a business centre it has declined since the building of the first railroad brought the overland trade via the Santa Fe trail to a close and diverted much traffic to Albuquerque. Pop. 5,072.

Buildings, etc.—By reason of its long political and ecclesiastical importance Santa Fe contains by far the most interesting and some of the finest buildings in the Southwest. First in historical importance is the "Palace," a massive-walled, one-story structure of adobe, a block in length and facing the Plaza on the north. It was doubtless erected early in the 17th century and originally was square, with a large court in which the Spanish garrison was quartered. The building formed the headquarters of the Spanish and Mexican provincial governments successively until 1846, when General Kearny took possession of New Mexico for the United States. Diego de Vargas, the reconqueror of New Mexico in 1692, and Zebulon Montgomery Pike (after whom Pikes Peak was named), with many others of note, were imprisoned therein, and Gen. Lew Wallace finished his 'Ben Hur' in one of its rooms while governor of the Territory of New Mexico. Next in importance, perhaps, is San Miguel Church, a plain adobe structure, largely destroyed by the Indians in 1680, restored in 1710, and greatly modified within recent years. The cathedral, a fine modern sandstone edifice, is built around a parish church known as the Parroquia, which was probably erected on the site of a still older church, built by Fray Alonso de Benavides in 1622-27, but destroyed in the revolt of 1680. The cathedral contains handsome carved stone reredos originally erected in the former Capilla de los Soldados (built in 1730 on the south side of the Plaza) by Governor Marin del Valle and his wife in 1761. Of interest also in the history of Santa Fé are the Rosario Chapel, said to occupy the spot where Vargas made his vow before the surrender of the city in 1692; the Garita, formerly a military

SANTA FE, NEW MEXICO

1 The so-called "Oldest Dwelling House in the United States"

2 The Old Palace at Santa Fe

outpost at which the leaders of the rebellion of 1837 were executed, and long the site of a cemetery; the earthworks of Old Fort Marcy, north of the city, erected during the Mexican War; and an ancient dwelling mistakenly believed to antedate the Spanish conquest. The State Capitol, of brick and stone, completed in 1900, at a cost of \$200,000, is an attractive building. There are also the new Museum of New Mexico, above mentioned, a Federal building, the Scottish Rite Cathedral, a State penitentiary (cost \$150,000), a county courthouse, Saint Vincent's Hospital, Saint Vincent's Sanatorium, Saint Vincent's Orphanage, an Industrial School for the Deaf and Dumb, the Allison Presbyterian Mission (opened in 1881), the Government Indian School with 300 pupils, Saint Catharine's School (R.C.), San Miguel College (R.C.), Loretto Academy (R. C.), Mary E. James Mission School, and the School of American Research. Besides the cathedral there are two other Roman Catholic churches, a Protestant Episcopal church, an English and a Spanish Presbyterian church and an English and a Spanish Methodist Episcopal church.

History.—Santa Fe was established, on the site of at least one prehistoric Indian pueblo, by Juan de Oñate in 1605; it is, therefore, the second oldest white settlement in the United States, Saint Augustine, Fla., alone exceeding it in point of age. (See NEW MEXICO). The prospects of the town during its first few years were not encouraging. In 1617, there being only 48 colonists and soldiers in the province, which was surrounded by predatory tribes, the king, in response to an appeal for aid, rendered the desired succor, and by 1630 Santa Fe contained 250 Spanish inhabitants. In 1623 Fray Alonso de Benavides, custodian of missions, began the erection of a church, which was finished five years later, probably on the site of the present cathedral (see above). On 10 Aug. 1680 the Pueblo Indians, led by a native named Popé, arose in rebellion against the Spaniards, killed 400 of the 2,500 colonists, soldiers and priests, and laid siege to the capital until the 20th, when Governor Otermin and a thousand survivors who had taken refuge in the palace made a sortie, killing 300 of the Indians and capturing 50, who were afterward hanged, and on the following day started on a long overland journey to El Paso, Tex. Santa Fe remained in possession of the Indians until September 1692, when Governor Vargas recaptured the town with but little opposition, and late in the following year it was resettled with about 800 new colonists. Hostilities were renewed during the winter, but the Indians were soon overpowered and 70 of the participants hanged in the Plaza. There were several proposals to move the seat of the provincial government in the 18th century, but nothing was accomplished. French-Canadian trappers found their way to the Rio Grande by the middle of the century, followed by a brisk trade between New Mexico and Chihuahua, and, early in the 19th century, between the province and the American frontier, Santa Fe being the western entrepôt. This trade, which became known as the "commerce of the prairies," was conducted over the Santa Fe trail, first from Kaskaskia, Ill., later from Franklin and Independence, Mo., and increasing from

\$15,000 in 1822 to \$750,000 in 1844. During the rebellion of 1837 Governor Perez, the chief justice and other officials were killed and a Taos Indian installed as governor, but he was succeeded in 1838 by Manuel Armijo, who thwarted an attempt by 300 Texan rangers to invade Santa Fe in 1841. On 18 Aug. 1846 Gen. S. W. Kearny took possession of the town in the name of the United States, issuing a proclamation to that effect on the 22d. An adobe fort and blockhouse were erected on the northern heights and named in honor of Secretary of War Marcy, and under its embankments 200 Missouri volunteers were buried during the winter of 1846-47. Charles Bent, the first American civil governor, was murdered at Taos in January 1847; in the same year the first legislative assembly was held at the capital, the first newspaper was established and a saw-mill erected. In 1848 the treaty of peace with Mexico was proclaimed from the Palace, the *New Mexican* (still published) was founded and the Roman Catholic vicariate-apostolic of Santa Fe was established. New Mexico becoming organized as a Territory of the United States 3 March 1851, Santa Fe was established as its seat of government on 14 July. On 3 March 1862, during the Civil War, Santa Fe was abandoned by Union forces and occupied a week later by Confederates, but it was again evacuated on 8 April and occupied by the Federals on the 11th. The first railroad entered Santa Fe 9 Feb. 1880. Consult Bancroft, H. H., 'History of Arizona and New Mexico' (San Francisco 1884); Hodge, F. W., 'Santa Fe' (in L. P. Powell's 'Historic Towns of the Western States,' New York 1901); Twitchell, R. E., 'Leading Facts of New Mexican History' (2 vols., Cedar Rapids 1910); *Old Santa Fe* 1914-17.

SANTA MARIA, mā-rē'ā, Domingo, Chilean politician: b. Santiago, Chile, 4 Aug. 1820; d. there, 1889. He was graduated from the University of Santiago, admitted to the bar in 1847, interested himself in political matters and in 1851-52 was involved in an insurrection which caused his banishment for a year. On his return he was elected to Congress, made a reputation as an orator, and in 1858-59 was again banished. He was Minister of Finance under Perez in 1863-64, and in 1868 was appointed to the Supreme Court. He afterward served as Minister of Foreign Affairs, of the Interior and of War under Pinto, and gained great popularity by his measures during the war with Bolivia and Peru. He was elected President in 1881 for a term of five years, successfully terminated the war, subdued the Araucanian Indians, and by his able administration of affairs retained his popularity throughout his term of office. He was afterward president of the Senate. He is the author of 'Biografía de José Miguel Infante' (1853) and 'Memoria sobre los sucesos ocurridos des de la caída de D. Bernardo O'Higgins en 1823' (1858).

SANTA MARIA, Philippines, (1) Pueblo, province of Ilocos Sur, Luzon, 15 miles south of Vigan. It is on the main highway, and several cart roads lead from here to the interior. In December 1900, 2,150 insurrectionists surrendered here and took the oath of allegiance to the United States. Pop. 10,030. (2) Pueblo, province of Zamboanga, Mindanao, also called **BIASONGAN**, on the western sea-coast at the mouth of a river, 56 miles north of Zamboanga. It has a well-sheltered harbor. The surrounding region is heavily timbered with valuable woods, and one of the largest saw-mills in the southern Philippines has been erected here.

Two smaller pueblos have the same name: (1) pueblo, province of Pangasinan, near the Agno River, 32 miles east of Lingayen; pop. 3,940; (2) pueblo, province of Zamboanga, Mindanao, in the extreme southwest, three miles northwest of Zamboanga, the provincial capital; pop. 2,200.

SANTA MARIA DE PANDI, *dā pān'dē*, Philippines, pueblo, province of Bulacán, Luzon, on the Santa Maria River, three miles from its mouth, six miles northeast of Bulacán. It was almost entirely destroyed during the insurrection, as it was the military centre of the insurrectionists, and was burned by American troops; it is, however, being rebuilt. It is in a productive rice and fruit region, has good roads and is near Manila and the Manila and Dagupan Railroad; there are also facilities for river transportation. Pop. 10,510.

SANTA MARTA, *mār'tā*, Colombia, capital of the department of Magdalena, stands on the north coast near the mouth of the Magdalena River. The surroundings are attractive but not salubrious. It has a good harbor, is an episcopal see, and has a noteworthy cathedral. Pop. 8,348.

SANTA MAURA, *mow'rā*, or **LEUCADIA**, Greece, an island of the Ionian group off the western coast, from which it is separated by a strait which was rendered navigable in 1903 by a canal cut through the sand-banks which block the shallow channel. It covers an area of about 180 square miles, is mountainous, the ranges running north and south and terminating in the white cliffs from which the island derives its name. The eastern portion is unproductive; the west and north are fertile, producing vines, pomegranates, olives, citrons, almonds and some corn. The chief source of wealth consists in the bay-salt, about 8,000 tons of which are exported annually. Bee-culture is carried on, but agriculture is the principal industry; navigation and fisheries also occupy a considerable number of the inhabitants. Cape Ducato (q.v.), formerly Leucates, at the extremity of the peninsula on the southwest, is the high rock (200 feet) where once stood a temple of Apollo, also known as Sappho's or the Lover's Leap. It was also the scene of several early Grecian tragedies. Amaxichi is the principal town, on the northeast, with about 6,000 inhabitants. Nearby is the fortress of Santa Maura.

SANTA MONICA, *mōn'i-kā*, Cal., city in Los Angeles County, 15 miles west of the city of Los Angeles, on the Pacific Ocean and on the Southern Pacific and the Southern Cali-

fornia railroads. It is a popular summer resort, has excellent bathing and boating and other amusement facilities. It is headquarters for several motion picture companies. There are considerable shipping interests and there is a 1,600-foot concrete pier. The Santa Monica Military Academy is located here. Pop. 7,847.

SANTA ROSA, *rō'sā*, Cal., city, county-seat of Sonoma County, on Santa Rosa Creek, and on the Northwestern Pacific, the Southern Pacific and on the Petaluma and Santa Rosa Electric railroads, about 52 miles north by west of San Francisco. Settlements were made in the vicinity about 1850; but the place was not laid out nor incorporated until 1854. It received its name partly from the profusion of roses which are found here all the year. It is situated in a productive agricultural region noted for its fruits, vegetables, grain, etc. It has large stock-raising interests, and considerable attention is given to dairying. The chief industrial establishments are fruit-drying and canning works, flour mills, machine shops, soap works, carriage factory, basalt quarries, wooden factories, stove factories and lumber yards. It suffered severely in the earthquake of 18 April 1906. It contains a convent, experimental botanical gardens (of Luther Burbank), public library, hospitals, county jail, high school, post-office, city hall, etc. Many trees shade the broad streets which are clean and well kept. The educational institutions are the Ursuline Academy, high school, Santa Rosa Ladies' College, the Pacific Methodist College, public and parochial schools, private schools, etc. The city is on level ground, 152 feet above sea-level. There are five banks with deposits aggregating about \$500,000. The total value of public property is \$750,714. The waterworks are municipally owned. The city is very well built, and is modern in every respect. Pop. about 13,000.

SANTA ROSA, Philippines, pueblo, province of Languna, Luzon, on the west shore of the Bay Lagoon, 20 miles west of Santa Cruz. It is on the main road and on the line of a projected railroad. Pop. 9,450.

SANTA ROSALIA, *rō-sā'lē-ā*, Mexico, a town in the southern part of the state of Chihuahua, on the Mexican Central Railroad. It is noted for its hot sulphurous springs. Pop. about 8,000.

SANTA TECLA, *tā'klā*, a picturesque town in Salvador. See **NUEVA SAN SALVADOR**.

SANTÁL PARGANAS, *sān-tāl' par-gūn'-as*, India, a district in the Bhagalpur division of Bengal, bounded on the north and partly on the east by the Ganges. Area, 5,456 square miles. The district is named from the Santáls, who form the most characteristic portion of its inhabitants, and are also found elsewhere in India. They are one of the aboriginal races belonging to the Dravidian stock, are dark-colored, and mostly profess a religion of their own, in which the worship of a chief deity and subordinate deities and a sort of ancestor worship play a chief part. They live chiefly by hunting, and are exceedingly fond of flute-playing, dancing and singing. The Church Missionary Society and the Scandinavian Home Mission have succeeded in

improving their condition and promoting education among them. The district is crossed by lines of the East India Railway. It contains the old Mohammedan city of Rajmahal on the Ganges and also Deogarh, the Hindu place of pilgrimage. The capital is Dumka. Pop. 5,326. Pop. of district, 1,809,737.

SANTALS, or **SANTHALS**. See **SANTAL PARGANAS**.

SANTANA, sän-tä'nä, **Pedro**, West Indian soldier and politician: b. Hineha, Santo Domingo, 29 June 1801; d. there, 14 June 1864. He was a lawyer and a wealthy land owner living quietly on his estates until 1844 when the Dominicans revolted against Haiti. He joined their cause, was appointed brigadier by the junta and speedily rose to the chief command of the insurgent army. He was elected President for four years in November 1844 and administered the affairs of the government with great success, endeavoring to promote agricultural interests and to increase the resources of the country. In 1849 he was called to the command of the army, defeated the invader Soulouque, deposed President Jiménez and ruled as dictator until the election of President Báez in October 1849. He was re-elected President in 1853, and again repulsed the invasions of Soulouque in 1855 and 1856. He resigned in 1857 and was succeeded by Báez, but after the revolt of 1858 again assumed the government. He had strongly favored annexation to the United States in 1849 but the movement had been defeated by Báez, and now, in despair of bringing the government to a satisfactory basis, he ceded it to Spain. He was given rank as lieutenant-general in the Spanish army and retired to his estates, but when the insurrection against Spanish authority broke out he marched to Azua, where he at once crushed the rebellion. When, however, the insurrectionary spirit became general he again retired to his estates where he died shortly before the end of Spanish rule. His last days were embittered by the hatred of many of his countrymen who regarded him as a traitor, but he is now generally recognized as a thoroughly honorable and upright man who acted solely from disinterested motives, while his courage is held unquestioned even by his enemies.

SANTANDER, sän-tän-där', **Francisco de Paula**, Colombian soldier and statesman: b. Rosario de Cúcuta, New Granada, 2 April 1792; d. Bogotá, 5 May 1840. In 1810 he engaged in the war for independence, fought in the ensuing campaign, in 1817-18 was with Bolívar, and assisted the Liberator to gain the battle of Boyacá (7 Aug. 1819). For his services he was promoted general of division. In 1821 he was elected to the Vice-Presidency of Colombia, with Bolívar as President. While the latter was absent in the southern Isthmus and Peru (1822-27), he administered the government with much ability. Re-elected in 1827, he became the leader of the opposition to Bolívar, and when the latter (1828) arrogated to himself dictatorial powers Santander was deposed, and sentenced to death on an unsupported charge of attempted assassination of the dictator; and though the sentence was later commuted to exile, he was deprived of all rank. The Colombian Republic ended in 1831, Santander was elected President of New Granada in 1832, and after the close

of his term (1837), served also in the Congress. His administration was one of order and progress, and laid the basis of the Republic of New Granada, the modern Colombia. He was among the wisest leaders of the time, and wrote a justification of his political course in 'Ayuntamientos para las Memorias de Colombia y Nueva Granada' (1837).

SANTANDER, Colombia, a department situated in the north central part of the country, between Venezuela and the Magdalena River. Area, 17,865 square miles. The greater part is occupied by the Eastern Cordillera of the Colombian Andes, which runs lengthwise through the department. The range is cut near the middle by the deep valley of the Sogamoso River. Only the uplands are inhabited; the lowland along the Magdalena is an unhealthy and densely forested wilderness. The chief products are sugar, coffee, cocoa, tobacco, cotton, rice and wheat. The mountains, however, are rich in minerals, including gold, silver, iron, copper and coal. Pop. 400,084.

SANTANDER, Spain, (1) capital of a province of that name, and one of the chief ports of the Peninsula, 207 miles by rail north of Madrid, near the Bay of Biscay. The principal modern buildings are the town-hall, theatre, market, barracks, bull-ring, clubs, civil and military governor's residences, the institute and other schools, custom-house and hospitals. There are numerous open squares and magnificent promenades, notably that of "Paseo del Sardinera," which leads to the bathing establishment. The higher and lower town are direct antipodes in point of architecture and general construction. The cathedral, of Gothic type, has a fine crypt containing a Moorish font. The chief features of the city are its quays and factories. There are ship-yards, paper-works, foundries, extensive breweries, sugar refineries, manufactories of sails, hats, candles, vermicelli, phosphorus, sulphuric acid, fish-curing establishments, etc. The industries, trade and fishing of Santander are flourishing and important. The harbor conditions have been greatly improved. Extensive acreage has been reclaimed from the sea, upon which a fine esplanade has been constructed, with public gardens and a new quay. The principal export is iron ore, in normal years, chiefly sent to Great Britain and Germany. Other exports are wine, flour, provisions, etc. The imports amount to much more, and consist of manufactured articles from England, France, etc., embracing machinery, textiles, foreign produce, timber, petroleum, etc. Women do the lifting of cargoes. Santander was probably the ancient Roman *Portus Blendium*. The town was sacked by Soult in 1808. Pop. 65,046.

(2) The province of Santander, on the north coast of Spain, covers an area of 2,108 square miles. It is enclosed on all sides but the north with lofty summits and traversed by railroads of various kinds. It possesses extensive forests and important mines of iron and lead; it also produces large quantities of grain. The industries of mining, sylviculture and agriculture are steadily improving. Livestock is abundant and valuable, especially in the highlands. Pop. 312,282.

SANTEE (sän-tē) **RIVER**. See **WATEREE RIVER**.

SANTERRE, sän-tär, Antoine Joseph, French revolutionist: b. Paris, 16 March 1752; d. there, 6 Feb. 1809. He was a brewer by trade and through his wealth and generosity possessed of much influence. His brewery in the Faubourg Saint-Antoine was used as a meeting place for the Jacobins and he exerted go, 29 June 1801; d. there, 14 June 1864. He commanded a battalion of the national guard in the storming of the Bastille in 1789, was conspicuous in the riots of the Champ de Mars, in the attack on the Tuileries in 1792 and in the insurrection of August in that year. He rose to be commander-in-chief of the national guard and field-marshal. In 1793 at the head of an army of 20,000 men he was defeated at Coron, was recalled and arrested as an Orleanist, and did not gain his release until the fall of Robespierre, after which he retired to private life. There is no evidence to substantiate his classification as one of the extremists of the Revolution. Consult Carro, 'Santerre, sa Vie politique et privée' (1847).

SANTI, sän'tè, Angelo de, Italian musician: b. Trieste, 12 July 1847. He was educated in Germany, France and Austria; entered the Society of Jesus in 1863, and was ordained to the priesthood in 1877. From 1877 to 1887 he was director of the Gymnasium, Zara, Dalmatia. Pope Leo XIII called him to the editorial staff of the *Civiltà Cattolica*, with the charge of restoring ecclesiastical music to its former conformity to the spirit of the Church. In 1887 he also became professor of liturgical chant at the seminary of S. Apollinare. With Carlo Respighi, Father Santi founded *Rassegna Gregoriana* in 1902, and in 1909 attended the National Congress of Sacred Music at Pisa. In 1911 he founded a superior school of sacred music at Rome and served on the Pontifical Commission for the Vatican edition of the Gregorian Liturgical books. He has published 'Adolfo Kolping e les Società cattoliche degli artigiani' (1891); 'Ricordo materno,' a novel (1896); 'Le Litanie Lauretane' (1897); 'Studi biografici su Elena Lucrezia Cornaro Piscopia' (1903); 'Il cursus nella liturgia e nella storia letteraria' (1903); 'A Londra, note ed impressioni' (1904); 'Lagrime nuove,' a novel (1909) and contributions to *La Civiltà Cattolica*.

SANTIAGO, sän-tè-ä'gō, capital of the Republic of Chile, situated at the base of the Cordillera of the Andes. It occupies an area of eight square miles in a fertile plain about 2,000 feet above sea-level, and is divided into two districts by the Mapocho River, which is crossed by many iron bridges. The most important part of the city is that which lies between the river and the Alameda de las Delicias a very wide avenue with many rows of fine trees. Cerro Santa Lucia, a hill rising to a height of more than 200 feet above the gabled or flat house tops, is made an attractive place of public resort by gardens and an open-air theatre. Other distinctive features are Cousiño Park and the Agricultural School Farm, each 320 to 330 acres in extent; the former devoted merely to outdoor recreation while the latter is the most useful centre of public instruction in Chile. Established in 1842, this school farm (*Quinta Normal de Agricultura*) now includes the Agricultural Institute and Training School, botanical gardens and conservatories, a zoologi-

cal garden, the Museum of Natural History, Veterinary Institute, institutes of Vegetable Pathology and Animal Vaccine, and the Chemical Laboratory. Noteworthy buildings are Congreso Nacional, the Moneda (residence of the President of the republic), cathedral and archiepiscopal palace, National Library (160,000 volumes), city hall, Palace of the Courts of Justice, university, National Conservatory of Music, Municipal Theatre, Astronomical Observatory, museum of fine arts (where annual exhibitions of painting and sculpture are held), Central Railway Station, palace of the exposition and many luxurious private residences. Educational institutions include district and private schools, those maintained by religious bodies, the National Institute (secondary instruction), commercial technical institute and professional school for girls. The university provides instruction in medicine (its most important faculty), law, engineering, etc. There are also normal schools, a good school of arts and trades, institute of pedagogy and schools of the fine arts. The board of public hygiene exerts an excellent influence for the control of diseases which were formerly prevalent. The water supply is good and abundant. Santiago has a mild climate: frosts are not unknown, though snow rarely falls. Industrial establishments are flour and wood-working mills, foundries, breweries, tanneries, etc. There are seven national and three foreign banks; electric street cars and a belt-line railway; and railway service for communication with the coast. The state shares with four private companies the task of maintaining the telegraph service. There are two telephone companies. The municipality has an income of about \$2,000,000 for public expenditures. On 8 Dec. 1863 the church La Compania was destroyed by fire during service, and about 2,000 out of the 3,000 of the congregation, mostly women, perished, and on 16 Aug. 1906 the city was visited by a severe earthquake, followed by fire. Pop. 397,941. See also CHILE.

SANTIAGO DE LOS CABALLEROS, dā lōs kā-bāl-yā'rōs, Santo Domingo, city, on the Yaqui del Norte River, 80 miles northwest of the city of Santo Domingo, 20 miles south of Puerto Plata. It is connected with Puerto Plata by railroad, and also with the east coast by a continuation of the road originally extending from Sanchez to Concepcion de la Vega. It is situated in the Vega Real, the most fertile agricultural section of Santo Domingo, and is the largest and most prosperous inland city of the country, having extensive commercial interests, especially in tobacco. Pop. about 12,000.

SANTIAGO-DE-COMPOSTELLA, dā-kōm-pōs-tēl'yā, Spain, a city on the Sar, in the province of Coruña, 32 miles south of the city of Coruña, romantically situated on a slope of Monte Pedroso. It is the seat of a university and of an archbishopric. The cathedral, begun 1082 and completed 1128, is in the form of a Latin cross, is well preserved and has a remarkable interior. It is on the site believed to be the grave of the apostle Saint James, whose bones are said to be in the foundation. Other notable buildings are the episcopal palace, the hospital (founded by Ferdinand and Isabella in 1504),

the town-house, the College of Tonseca and the great convent of Saint Martin (overhanging a ravine), formerly one of the wealthiest Benedictine establishments and now a barrack. In the large square or Plaza the bull-fights take place. There are many promenades, fountains and mineral springs in the vicinity, besides pastures and fertile valleys, which produce grain, hemp, fruit, etc. The local industries are distilleries, breweries, soap, chocolate, linen, crystal, paper and small silver articles. There are good schools and a fine library in the university (founded in 1532). Long the most frequented place of pilgrimage in western Europe, the city acquired the popular designation of the "Mecca of Spain." Pop. about 25,000.

SANTIAGO DE CUBA, *dā koo'bā* or *kū'bā*, former name of the largest and most eastern province of Cuba, now Oriente; area, 14,227 square miles. It contains the principal mountain ranges of Cuba, the general trend of which is from southeast to northwest; the river Cauto, the largest river of the island running from east to west, divides the mountain system; the ranges to the north are very confused and irregular; the best defined range is that of the Sierra Maestra, near the southern coast. The valleys and sea-coasts are very fertile; sugar, coffee, cocoa and tobacco are the chief products; bananas and cocoanuts are cultivated, and vegetables and fruits may be raised with little care or supervision. Mahogany, ebony and other valuable hardwoods grow in abundance in the interior, and are exported. Oriente has more mineral wealth than any other province of the island; iron, manganese and copper have long been mined in quantities of commercial importance, and zinc and lead have been found. Good grazing lands abound in portions of the province, and stock raising is an industry of increasing importance. The development of the province was long retarded by lack of transportation facilities, but with the increase of railroads following American occupation, opportunity is afforded for further exploitation of the large resources. Pop. 567,988.

SANTIAGO DE CUBA, chief city of the province formerly of the same name, now Oriente, situated on a fine bay about six miles from the southern or Caribbean coast of the island of Cuba. It is the centre of the mining district, and has a large foreign trade, though the places of business are unpretentious or even shabby. Many of the dwelling-houses are a single story in height; their gardens, the Alameda, some points on the slopes of the surrounding mountains and the shores of the bay are especially attractive. A noteworthy building is the old cathedral, fronting on the Plaza de Armas. The mean temperature in winter is 82° F., and in summer 88°. It was formerly regarded as an exceedingly unhealthy town, yellow fever being prevalent throughout the year; but a marked improvement in this respect was effected through the sanitary reform measures carried out under the direction of the military government (army of the United States) after the war of 1898. The population, as shown by the official census, in 1914, was 62,358. The city has a good water-supply, furnished to 94 per cent of the dwellings, etc., through an aqueduct called El Paso de la Virgen. Santiago was founded in 1514; from 1522

to 1552 it was the capital of the island. It is full of historical interest, the battlefields of San Juan and Caney, the peace tree, and the remains of the Spanish squadron, destroyed outside of the harbor, being of especial interest to Americans. For subsequent events, and especially the important naval and military operations in 1898, consult Marrion Wilcox, 'A Short History of the War with Spain.' See also CUBA.

SANTIAGO DE CUBA, Military and Naval Operations at. For an account of these events of the Spanish-American War, see UNITED STATES, *War with Spain*.

SANTIAGO DEL ESTERO, *dēl ēs-tā'rō*, Argentina, (1) capital of the province of that name, lies in a fertile valley on the right bank of the Rio Dulce. Its chief buildings are the cathedral, national college, normal school, primary schools and bank. It has extensive orchards. The town was founded in 1553. Pop. 12,000.

(2) The province of Santiago del Estero is situated in the north-central part of the republic, covers an area of 55,385 square miles and consists of a broad plain with several low ranges in the west, and a few salt marshes in the south. The streams are the Salado and Dulce rivers. Irrigation is necessary; sugar, corn, wheat, grapes, cotton and tobacco are grown. The chief industries are lumbering, agriculture, stock-raising and wool-weaving. The forests contain valuable woods. The climate is hot. Pop. 247,000.

SANTIAGO DE LAS VEGAS, *dā lās vā gās*, Cuba, a town in the province of Havana a few miles south of the capital, on the Havana-Guanajay Railroad. The town lies on elevated ground, and is a suitable place for the acclimatization of foreigners. It is regularly built, with two plazas and a handsome church. The tobacco industry is predominant.

SANTIAM, a tribe of the Kalapooian stock of North American Indians formerly residing on Santiam River, a tributary of the Willamette, in Oregon. About 100 are at Grande Ronde reservation, Oregon, when as American citizens they support themselves by agriculture. Consult Lewis, 'Tribes of the Columbia Valley and the Coast of Washington and Oregon' (Lancaster, Pa., 1906).

SANTILLANA, *sān-tēl-yā'nā*, Inigo López de Mendoza, Marquis of, Spanish soldier and poet: b. Carreon de los Condes, Old Castile, 19 Aug. 1398; d. Guadalajara, 25 March 1458, generally known as the Marquis of Santillana. He was of noble family and inherited large estates from his father while still a child. These his mother managed to keep together in a very turbulent and insecure age and to afford the boy the best education possible. He early became a soldier and was mixed up in the civil troubles of Spain and, somewhat later, he distinguished himself in wars against the Moors of Granada. He defended and widened the boundaries of the territory held by the Christians in Spain. At the battle of Olmedo (1445) his success was so signal that it won for him the title of Marquis de Santillana and Conde del Real. He was also given the right to use that title "Don" which was then considered a very high privilege. He followed his

successful political career and soon became the most powerful figure in Castile. At the same time his reputation as a poet and a scientist kept pace with his political advancement; and his fame extended to foreign countries from which came many noted literary men and ambitious students to visit at his home, where all were made welcome. Santillana was one of the most brilliant figures of his age. He distinguished himself in the rough sports and contests of the knights; he was a noted public speaker, a master spirit at the banquet, a natural courtier, a successful and popular leader of men. To all these qualities he added poetic gifts superior to those of most of the Spanish poets of his day. So enthusiastically was he admired by his contemporaries for his poetic gifts and his philosophical studies that he was called the "wisest of the wise." His literary work covers a wide field. He began as an imitator of the ancient troubadours, displaying in his work strong notes of originality. He soon gained a reputation as a writer of sprightly songs and love poems of a true lyrical ring. But among his work of this period are his "serranillas" or mountain songs, a species of poetry which he continued to cultivate later in life with such signal success that the best of his serranillas are still of interest on account of their simplicity, naturalness of tone and poetic beauty of form and expression. He became the master writer of troubadour poetry of his time. In every anthology of Spanish poetry are included "serranillas" of Santillana, many of which are still popular in Spain. He was less successful in gaining popularity for his didactic poetry and his imitation of the Italian poets, especially Dante. He followed the allegorical tendencies of the latter and he was fond of making a display of learning which often amounts to pedantry and detracts from the brilliancy of his poetical talent. Though his fame is greatest as a writer of troubadour poetry, Spanish literary critics agree that he shows more originality and poetic talent in his didactic work. Among his works in this field are 'Diálogo de Bias contra fortuna,' 'Doctrinal de Privados,' 'El Centiloquio.' These show originality greater than that of any contemporary poet. They are graceful, beautiful in form, chaste in language and vigorous in style. It is in his imitation of Dante that his philosophical studies are most seen. His classical and mythological allusions and adornments are so excessive as almost to become a vice. The added fact that everywhere his imitation of Dante is so patent detracts from the actual literary value of this part of his work. But it has a secondary value in that it brought strongly to the attention of Spain the great mine of literary wealth existing in Italy. He introduced into Spain the Italian form of the sonnet and produced excellent imitations of Petrarch. He was also one of the first Spanish writers to dig into the mine of literary wealth of Boccaccio.

Santillana, owing to his popularity, had a large literary following and many imitators, yet he cannot be said to have created a school. His influence on the Spanish language was more general and prolonged than specific and confined to a certain definite time. Among his works, in addition to those already mentioned, are his Vaqueira pastorals, 'Proverbios de gloriosa doctrina e fructuosa ensenanza,'

'Comedieta de Ponza.' Consult Menéndez Pelayo, M., 'Antología de poetas liricos castellanos' (Madrid 1894); Rios, José Amador de los, 'Obras de Inigo López de Mendoza, Marqués de Santillana' (Madrid 1852); Sanvisenti, B., 'Primi Influssi di Dante, del Petrarca e del Boccaccio sulla letteratura spagnuola' (Milan 1902); and good Spanish literature such as that of Ticknor.

SANTLEY, Charles, Sir, English baritone: b. Liverpool, 1834. He studied music in England and Italy and made his début in opera at Covent Garden in 1857. He won a great success at Hoel in the opera 'Dinorah' in 1859 and in the part of Rhineberg in 'Lurline' in 1860. He has been especially devoted to Italian opera and has sung in the large capitals of Europe, in Australia and South Africa. He was knighted in 1907. He published 'Student and Singer' (1892); 'The Art of Singing' (1908); 'Reminiscences of my Life' (1909).

SANTO DOMINGO, sán'tō dō-mēng'gō, called also HAITI, the second in size of the West Indian Islands. Its greatest length is about 400 miles; its greatest width 160 miles; its area is estimated at 28,249 square miles. For particulars in regard to physical geography, geology and mineral resources, history, population, etc., see HAITI; and DOMINICAN REPUBLIC, the political divisions of the island.

SANTO DOMINGO. The merchant marine of the Dominican Republic consists of one steamer of 263 tons, eight schooners of from 73 to 193 tons and 20 schooners of less than 50 tons. These vessels are engaged principally in the home coastwise trade, but they make occasional voyages to Cuba, Haiti, Saint Thomas, Porto Rico and Turks Islands.

SANTO DOMINGO DE BASCO, dā bās'kō, Philippines, town of the Batanes Islands, province of Cagayan, on the northwest coast of Batan Island. It is the chief town of the group and is well built, with several fine buildings. It has a good anchorage in Santo Domingo Bay; the inhabitants are chiefly engaged in the coasting trade and in fishing. Pop. 2,800.

SANTO TOMÁS, tō-mās, Philippines, town of the province of Batangas, Luzon, 26 miles north of Batangas. It is on the main road to Manila and on the line of a projected railroad, near the boundary of Laguna. It has good schools. Pop. 9,500.

There is a smaller pueblo of the same name in the province of Union, Luzon, 22 miles south of San Fernando, at the head of the port of Santo Tomás on the main road. Pop. 6,000.

SANTO TOMÁS, a mountain of the Philippines, in the southern part of the province of Union, east of Agoo. It is 7,418 feet in height, the highest peak in the province. On its western side the land slopes rapidly to the coast.

SANTONIN, a proximate principle ($C_{18}H_{18}O_4$), the active principle of santonica, possessing acid properties, obtained from wormseed, the seed of a species of southernwood. It is colorless, crystallizable and soluble in alcohol, and in the fixed and volatile oils, is bitter and is one of the most efficacious vermifuges for roundworms. Its administration

produces changes in the urine and also affects the vision for a few hours; but no ill results follow.

SANTORIN, sän-tō-rēn', **THERA**, or **CALLISTE**, Greece, the largest of one of the island groups in the Ægean Archipelago, 60 miles north of Crete. It has an area of 27 square miles. The eastern slope is covered with vineyards; the western shores are precipitous, with deep ravines and volcanic indications. The town occupies the lofty heights overlooking precipices. The wines of the island are the chief staple and are called *vino-brusco* and *vino-santo*. Various eruptions have occurred in the vicinity which from time to time have changed the surrounding topography. There are practically no trees and the water supply often fails, it becoming necessary to procure fresh water from neighboring islands. There are many ancient remains, and excavations have brought to light numerous inscriptions of the Mycenaean and early periods. Pop. 19,597. Consult von Gaertringen, Hiller et alia, 'Thera, Untersuchungen, Vermessungen und Ausgrabungen in den Jahren 1895-98' (Vols. I-IV, Berlin 1899-1902); and 'Inscriptiones Græcæ Insularum Maris Ægæi' (Vol. II, ib., 1898).

SANTOS, sän'toos, Brazil, city in the state of São Paulo, on the Atlantic Coast, 200 miles southwest of Rio de Janeiro and 45 miles from the city of São Paulo. The immense export and import trade of the interior region which it serves has made it the second port of the republic, the total value of its trade reaching about \$251,000,000 annually. The harbor is accessible to the largest vessels. Santos is the largest coffee exporting port in the world, being the outlet for the great coffee-producing *parêndas* of São Paulo. Coffee to the value of about \$65,000,000 is shipped annually from this port to the United States. The annual export of coffee to all countries from this port has averaged over \$120,000,000 for the last 12 years. The chief exports from Santos to foreign countries in 1915 were coffee, valued at \$113,424,679; hides, \$539,275; cacao, \$289,340; bran, \$69,754; and tobacco, \$24,254. Exports to the United States in the same year totaled \$63,055,465, of which coffee represented \$62,431,991; hides, \$318,817; and cacao, \$292,500. Frozen meat is fast becoming an important export, the value now exceeding \$2,000,000 annually, Great Britain, Italy and the United States being the chief purchasers. Bananas now rank third in the list of exports, being valued at \$500,000 annually and going to Argentina. Santos is situated on an island, protected from the ocean by a larger island, with a channel six miles long between the two. A sea-wall three miles long has been constructed on the side of the city. This made possible the reclaiming of much pestilential and malaria-breeding swamp land, and the city's healthfulness has been greatly benefited in consequence, yellow fever being no longer endemic. The city is well built, has many fine streets and boulevards. Churches crown the heights of Monserrate. There are several monasteries, a city hall, custom-house, two hospitals, an arsenal, banks, electric-lighting plants, electric street railways, gas system and modern water-supply system. A railway connects the city with São Paulo and the interior. Pop. 90,000. Consult

Rines, G. E., and Wilcox, M. (eds.), 'Encyclopedia of Latin America' (New York 1917).

SANTOS, sän'tzōz, Francisco, Spanish writer: b. in the first half of the 17th century in Madrid; d. about 1700. He published, between 1663 and 1697, 16 volumes, principally of short stories, intended, as the author professes, for popular amusement. 'Dia y noche en Madrid,' the first of this series, contains many excellent and startlingly graphical pictures of life in the capital of Spain. 'Perequillo, el de las guallineras' (Madrid 1668), a story written in opposition to the picaresque novels still extensively read in his day, was also popular and is still read in Spain. 'Verdad en el potro y el Cid resuscitado' (Madrid 1679) is of interest on account of the songs and popular ballads it contains, many of which date back to an early period of Spanish literature, and some of which differ from all other known versions. Among his other popular stories are 'El diablo anda suelto' (Madrid 1677); 'El vivo y el defunto' (Madrid 1692); 'Tarascas de Madrid y tribunal espantoso' (Valencia 1694); and 'Los Gigantones de Madrid.' Few of Santos' stories now appear in their original form because the literary taste of the Spanish people has changed since his day; but they have been recast by other authors and the ideas contained in many of them have been made use of by some of his successors in the literary field. Consult any good history of Spanish literature.

SANTOS CHOCANO, zho'kän-ō, José, Peruvian poet: b. 1875. Since the death of Rubén Darío (q.v.) in 1916, Santos Chocano has been the undisputed leader of Latin American literature; and even before the disappearance of the latter from the scene, Santos Chocano had become a figure at least equal in importance with him on the literary horizon. He influenced Darío strongly and for the better, by enlarging his view and making him, in his latter years, more cosmopolitan. It was through Santos Chocano that Darío was led to see the United States and the American people with other and more favorable eyes. Endowed with a broad vision, he threw behind him, early in his career, all sectionalism and local views, which had hampered most of the preceding Latin American poets and prose writers, and announced himself the apostle of cosmopolitanism and Pan-Americanism. At a time when other younger poets like Rubino Blanco Fombona of Venezuela made it their special business to vilify the United States and all things American and to hold her people up to ridicule as uncouth, uncultured, rude dollar-grabbers, overbearing and unbearable, Santos Chocano proclaimed himself the singer of America in all its varying moods and phases, past and present. He sang, 'My lyre has a soul, my song an ideal.' The sound of his lyre was America; the ideal of his song the unity and harmony of all things American. In his 'El Canto del Porvenir' (Song of the Future) he sees the spiritual union of the North and the South, of the Latin and the Saxon. He believes the one is necessary to the other, and that they have been placed together in the Western world for a purpose. Santos Chocano has the truest vision of all the Latin American writers; and his influence, which has

become very widely extended, has been generally exercised for good. His 'Alma America,' in which he emphasizes the idea of race unity on the Western continent, is a stirring poem which became immensely popular and exercised a strong influence on the younger poets of Latin America. Santos Chocano has become, in a sense, the leader of a new school of poetical thought, whose self-imposed task is to sing the beauties and glories of America. Though united through this ideal, the members of this school use widely different literary methods to attain their ends; and some of them are not broad minded enough to see beyond the boundaries of Latin America. Yet all of them can sing with him: "When I feel myself an Inca, I render homage to the Sun which gave me the sceptre of royal power; when I feel my Spanish blood, I evoke Colonial days." Santos Chocano has traveled much and has found a warm welcome in nearly all the Latin American countries. Some years ago he was lionized in Mexico City, and the Central American nations have paid high tribute to his genius. Consult Coester, A., 'The Literary History of Spanish America' (New York 1916); González Blanco, Andrés, 'Select Poems of José Santos Chocano' (Introduction to 'Fiat Lux,' Paris 1908).

SANTOS-DUMONT, dö-môn, Alberto, Brazilian aeronaut: b. São Paulo, Brazil, 20 July 1873. He was educated chiefly in France, and has resided in Paris since the death of his father, a coffee planter. Having experimented in aeronautics he made an ascent on 4 July 1898 from the Jardin d'Acclimation, Paris, in a spherical balloon 18 feet in diameter. At this time he was engaged upon the construction of a dirigible balloon which he completed so as to make the trial ascent on 20 September. It proved itself dirigible, but the experiment ended in disaster owing to the insufficiency of the air-pump. A second and a third machine were constructed, the latter being cigar-shaped, 66 feet long and 11½ feet in greatest diameter. It carried a four and one-half horse-power petroleum motor to work a five-foot propeller making 2,500 revolutions a minute. It was steered by a rudder of silk and bamboo having an area of about 25 feet. This machine ascended from Vaugirard, 13 Oct. 1899, sailed to the Champs de Mars, encircled the Eiffel Tower several times, proceeded to Auteuil and finally landed at the manœuvre grounds at Bagatelle. He continued experiments with new balloons, and on 18 Aug. 1901 his balloon collapsed and fell to the roof of the Trocadero Hotel. On 19 Oct. 1901 he won the Henri Deutsche prize of \$50,000 offered for a trip from the Aero Club at Saint Cloud around the Eiffel Tower and back to the point of departure in less than an hour. The actual time employed was 29 minutes and 30 seconds, the return being made against a strong wind. In 1902 he went to Monte Carlo with the design of crossing the Mediterranean and after making several ascents suffered an accident which precipitated himself and his balloon into the Bay of Monaco. In 1904 he was made chevalier of the Legion of Honor and five years later became officer. See AERONAUTICS, HISTORY OF—*The Dirigible*; and consult Mr. Santos-Dumont's 'My Airships' (New York 1904).

SANUTO (săn'oo-tō), or **SANUDO**, Marin, THE ELDER, of Torcello, Venetian statesman, traveler and geographer: b. Venice, about 1260; d. 1330-38. He traveled widely, knew the coasts and much of the interior of western, central and southern Europe, northern and eastern Africa, and southern and western Asia. He used his vast knowledge of geography and the trade routes of the world in an effort to reawaken the crusading spirit. To further the plan he wrote in 1303-07 his 'Liber secretorum fidelium super Terræ Sanctæ recuperatione' (Hanover 1611; Eng. trans., London 1896). This he presented to Pope Clement V; and in 1312-21 he was engaged upon two supplementary volumes, which when completed were presented with their predecessor to Pope John XXII, together with maps of the world and of Palestine, as well as the cities of Antioch and Acre, and charts of the Mediterranean and Black Seas and the West European coasts. The maps were probably the work of Pietro Vesconte, and on the whole compare favorably with modern maps. The books contain definite plans for the conquest of Palestine, displaying an extensive knowledge of the customs, wealth, extent and population of the countries described. There are 23 manuscript copies of the 'Secreta' in existence, of which the most important are those in the Riccardian Library, Florence; the British Museum, London; and the Paris National Library.

SANUTO, or **SANUDO**, Marin, THE YOUNGER, Venetian senator, historian and traveler: b. Venice, 22 May 1466; d. 1533. He was of patrician birth, and at the age of 17 went on a journey through Istria and the mainland provinces. He sought out famous people, places of interest and libraries wherever he went, copied inscriptions and made a careful and exhaustive record of his observations and experiences. Because of his exceptional ability he was elected to the Maggior Consiglio at the age of 20, five years less than the legal age, and in 1508 he became a senator. His diaries begin 1 Jan. 1496 and continue until September 1533, covering the proceedings of the legislative bodies in which he served and giving an exhaustive record of his experiences and associations during that period, filling 58 volumes. He was permitted to examine the secret archives of the state, and his friendships included the most famous and learned men of his time; so that his minute and accurate records, governed by his broad learning and rich associations, are of great value and undisputed authority. He collected a splendid library, including foreign as well as Venetian manuscripts, his activities generally fitting him for the post of historian to the republic, an appointment he greatly desired. This, however, twice passed to others, but Sanuto's services as a historian were eventually recognized by the republic through a yearly pension of 150 gold ducats. He was author of 'Itinario in terre ferma' (London 1847); 'I Commentarii della guerra di Ferrara' (Venice 1829); 'Le Vite dei Dogi' (in Muratori's *Rerum Italicarum Scriptores*, Vol. XXII, 1828); and the 'Diarii' (Venice 1872-1903).

SÃO FRANCISCO, sãn frãn-sês'kô, a river of Brazil, which rises in the Serra da Canastra, in the southwest of the state of

Minas Geraes, flows north-northeast through that state and the state of Bahia, then turning east forms the boundary between the states of Pernambuco and Alagoas on the north and Bahia and Sergipe on the south. It falls into the Atlantic 50 miles north-northeast of the town of Sergipe by two mouths, one to the north, called Aricari, so shallow as to be scarcely navigable even by canoes; and the other to the south, hence called Francisco do Sul, much larger and deeper, but unfortunately encumbered at its mouth by a large bar about six miles broad, covered with a heavy surf, and with seldom more than four feet of water on it. It is a large and majestic river, with a course which has been estimated at 1,600 miles, but, in addition to the bar at its mouth, has numerous rapids and cataracts, which make its continuous navigation impossible; those at Paulo Affonso, about 190 miles inland, are about 60 miles in length. Its principal affluents are, on the right, the Paraopeba, Guacuhi or Velhas, Jequitahi and Verde; and on the left the Andaia, Borrachudo, Abaité, Paracatu, Urucaia, Carininha, Correntes and Grande. Railroads have been built around some of the rapids and in conjunction with inland steamers on the river afford continuous communication for about 1,000 miles.

SÃO JOÃO DA BARRA, sãh zhō-oon' dā bār'rā, or **SÃO JOÃO DA PARAHYBA**, Brazil, a town on the Atlantic Coast of the state of Rio de Janeiro, at the northern end of the state. It is the port of Campos, with which it has railroad connection. But since Campos became connected by rail with Rio de Janeiro, São João has lost its importance, as the port is only an open roadstead. Pop. 5,000.

SÃO JOÃO DEL REY, dēl rā'ē, Brazil, a town in the state of Minas Geraes, situated 75 miles southwest of Ouro Preto, on the railroad running west from Barbacena. It was founded as a gold-mining town, but the gold has been exhausted, and the chief wealth of the town now comes from cattle raising and the manufacture of cloth and leather. Pop. 10,000.

SÃO LEOPOLDO, lā-oo-pōl'dō, Brazil, a town in the state of Rio Grande do Sul, situated on the railroad 18 miles north of Porto Alegre. The town has two churches, a Jesuit college and two high schools. It has had a considerable industrial and commercial development. Agriculture, viticulture and cattle-raising are carried on successfully in the surrounding country, and the town manufactures leather-goods. The products of the town have amounted to over \$6,000,000 annually, most of them going to Porto Alegre, which, besides the railroad connection, can be reached by steamboats on the Rio dos Sinos. The town was founded by German immigrants in 1824, and most of the inhabitants are still Germans. It was almost totally destroyed during the civil war of 1846. Pop. 7,500.

SÃO LUIZ DE MARANHÃO, loo-ēzh dā mǎ ran yān. See MARANHÃO.

SÃO PAULO, pow'loo, a state of Brazil, bounded on the north and northeast by Minas Geraes and Rio de Janeiro, on the southeast and south by the Atlantic Ocean and Paraná, and on the west by Matto Grosso. Area, 112,307 square miles, including a large section of fertile

but unsettled land near the Paraná River, which forms part of the western boundary. The principal mountains are between the capital of the state and Santos, Serra do Mar (average height about 3,000 feet); and, toward the interior, spurs of the Mantiqueira range. Adjoining the coast is a comparatively narrow strip or zone, low-lying and tropical in its characteristics; but an abrupt ascent leads from this to the plateau which extends westward to the Paraná, sometimes cut by the valleys of the river system, sometimes rough and mountainous, but in general maintaining an altitude which ensures a temperate climate. In fact, the winters in the southern part of the state are decidedly cold, frosts occurring many times during a single season; and at the capital the temperature occasionally falls below 32° F. The fertile red soil of the plateau is peculiarly adapted to the cultivation of coffee. The railway system of this state, with that of the neighboring Rio de Janeiro (q.v.), is the best in Brazil. A notable piece of engineering is seen on the line which crosses the Cubatão range at a height of more than 2,500 feet. The principal cities are the capital, São Paulo (founded by the Jesuits in 1552, became a city in 1712, created a bishopric in 1746) and the leading port, Santos. The Bulletin of the Pan American Union, April 1919, notes that the population of the city of São Paulo, which in 1900 was 239,820, at the end of 1918 had reached 504,278—an increase of 115 per cent in eighteen years. In 1900 there were 22,407 buildings in the city, valued at 33,306 paper contos (one conto, paper = \$270 U. S. gold). In 1918 fully 55,356 buildings were reported, valued at 89,456 contos. Santos (1919 est. 80,000) is built on an island, a narrow channel separating it from the mainland. Its harbor and general sanitary conditions have been improved by important works. It is not only the shipping centre of the State of São Paulo but also ranks as the largest entrepôt of coffee in the world. Two of the main causes of the prosperity of this state—which is generally regarded as the most progressive part of Brazil—are successful agriculture, undertakings to improve the means of communication, and immigration. For description of the coffee industry, cattle-raising, etc., in this state, see BRAZIL—AGRICULTURE AND FOREST PRODUCTS.

MARRION WILCOX.

SÃO THOMÉ, tō-mā', or **SAINT THOMAS**, Africa, an island in the Gulf of Guinea belonging to Portugal, and situated a little north of the equator in long. 6° 30' E., 150 miles northwest of Cape Lopez. Its area is 358 square miles. The whole island consists of a volcanic mountain 7,026 feet high, and heavily forested. The climate is equable, temperate and healthful, and the soil is very fertile. The chief products are coffee, cocoa, oranges, lemons, figs, grapes, pine-apples, vanilla, cinnamon, india-rubber, cinchona, etc. The exports are valued at over \$10,000,000 annually. Pop. 53,969. There are nine miles of railway in operation. São Thomé forms, with the neighboring island of Príncipe, a Portuguese province. The capital is Cidade, with a safe harbor and a pop. of 3,000.

SAÔNE, sôn (ancient, ARAR), France, a river which rises at Viomenil, in the department of Vosges, flows southwest through that depart-

ment, traverses the department of Haute-Saône, and on entering the department of Côte-d'Or, receives the Ognon. Continuing a southwest course, past Auxonne, it receives its most important tributary, the Doubs. It flows past Châlons and Maçon to Lyons, where it joins the Rhone after a course of about 280 miles; of these 190 miles are navigable. The Canal du Centre, Canal de Bourgogne and Rhone and Rhine Canal, bring it into communication with the Loire, Seine, Meuse, Moselle and Rhine.

SAOSHYANT. See **SOSIOSH**.

SAP, the fluid which circulates in plants, and consists of water carrying various nutritive salts in solution. This water and its contents, "crude sap," so-called, is absorbed by root-hairs and permeates the plant, passing through the woody portions of the vascular bundles, in the newer rings of the "sap-wood," which, in dicotyledons, constitutes a woody cylinder between the bark and the heart-wood or pith. This sap, by some process which is not fully understood, but which is ascribed to root-pressure, transpiration, or suction, severally or collectively, carries its raw materials to the Chlorophyll granules in the green, growing parts of the plant, where they are metamorphosed into organic substances, and are again taken away through the vast cells to those places where they are needed for the life or propagation of the plant, or are stored for future use. Maple and corn sugar, india-rubber, opium and the milk of certain plants are all saps, and the products of the lactiferous cells. Many plants, such as cacti and others, living in desert regions, store away water to carry them through the droughts, a fact which is taken advantage of by travelers in thirsty lands.

SAP-GREEN, a yellowish-green pigment which is prepared by mixing the purplish-red juice expressed from the ripe berries of buckthorn (*Rhamnus catharticus*) with an alkali. The liquid is fermented, evaporated until it has reached a proper consistency, and then suspended in bladders, to harden into a brittle mass. The color is used by water-color painters, paperstainers and leather-dyers, but is very fugitive.

SAPAJOU, or **SAJOU**, a French adaptation of an Indian word, and now applied to several species of American monkeys of the family *Cebidæ*. The sapajous live in flocks in the forests of Brazil, Peru, Guiana, Colombia and Venezuela, and possess tails of feebly prehensile powers, and feed on fruits, eggs, small birds, etc. They are familiar in habits, become soon domesticated, and are thus in favor among mountebanks, etc., who teach these monkeys to become very expert in performing tricks. Common species of sapajous are the sai (*Cebus capucinus*) and white-throated sapajou or sajou (*C. hypoleucos*).

SAPAN, or **SAPPAN-WOOD**, red dye-woods, obtained from two genera of the *Leguminosæ*, but principally from *Cæsalpinia sappan*. This tree is indigenous to tropical Asia and to the Indian Archipelago, but since it gives a good, red dye, similar to that of Brazil-wood, although somewhat difficult to fix, its cultivation is promoted in the West Indies and Brazil.

SAPHO. Of Daudet's 'Parisian Dramas' the most widely read and most intensely poig-

nant is *Sapho* (1884). Though Edmond de Goncourt pronounced it the author's "most complete, most humane, and most beautiful story," it owed its popularity not alone to its literary merits, which are very great, but also in part to the fact that it dealt with a phase of life that has often a morbid interest for those who, from whatever cause, are precluded from experience of it. The book is dedicated significantly "To my sons when they are twenty," to be to them a warning of the perils, spiritual and material, that encompass every attempt to set up domestic life outside of legitimate marriage. Gaussin, a youth of rich promise but weak will, is betrayed by the very generosity of his eager passion into a connection with Fanny Legrand, a woman who lives by and for sex and knows no law or love but the satisfaction of her animal desire, while she clings to Gaussin with the desperation of a last passion. How through the years of this union Gaussin's young ideals, family connections, material prospects, mental powers, moral character were sacrificed, blighted and betrayed; how he was tortured in turn by jealousy and desire, clung yet shrank, rejected, married another and returned to his degradation, only to find his utter sacrifice uncomprehended, because to such as she incomprehensible—all this is shown with relentless psychoanalysis and undeviating seriousness of purpose. No lighter touches relieve the development of the inevitable tragedy, finely allegorized in an unforgettable opening scene, where the ardent young student carries his new-won mistress up the long stairs to his dwelling, first a light burden, gaily borne, then from landing to landing ever heavier, till it bears him down in utter exhaustion at the end. Consult translations by Ives, G. B., Rogerson, T. F. and others.

BENJAMIN W. WELLS.

SAPI-UTAN, a small wild ox of Celebes. See **ANOA**.

SAPINDACEÆ, sãp-în-dã'sē-ē, a family closely allied to the maples, and containing the soap-berry (*Sapindus*), litchi-nut (*Nephelium*), and other genera. The species are usually tall trees or vines with watery juice. The leaves are generally compound, and alternate, evergreen and abruptly pinnate. The flowers are small, but often showy sometimes apetalous, sometimes with four or five unequal and imbricated petals, and about the same number of sepals; the stamens are eight, and are situated on a disc; the ovary is 3-celled, becoming in fruit capsular or indehiscent, or composed of several wing fruits, or a drupe, or nut, or berry. The species are mostly found in warm countries. The fruits of several, such as the *Nephelium*, are eaten, but the leaves of many are poisonous. The typical genus *Sapindus* has a very saponaceous fruit, used in the place of soap. In Brazil, a paste called "guarana" is made from the pounded seeds of the sapindaceous climbing shrub, *Paullinia cupana*, and serves for food, for medicine (since it contains caffeine), and for the preparation of a refreshing drink.

SAPODILLA, or **SAPODILLA PLUM**, an evergreen tree (*Achras sapota*) some 20 feet high with thick, shining leaves, clustered at the ends of the branches and a milky juice. It is sometimes called bully-tree, also, and is indigenous to tropical America, where it is

often cultivated for its fruit which in the West Indies is sometimes called naseberry. The flowers are small and whitish and the sapodilla, the fruit, resembles a russet apple in color and size and has a milky acrid juice, which disappears when over-ripe, leaving the fruit in a sugary condition and with a pleasant, pear-like flavor. It is a valuable food in warm countries. The seeds are large and black and used as an aperient and diuretic. The juice of the sapodilla is made into chewing-gum, the bark is astringent, and employed as a febrifuge (Jamaica bark), and the wood is reddish-brown, hard, heavy and durable.

SAPONIN, a glucoside contained in the roots of *Saponaria officinalis* or soapwort and many other plants; also in the fruit of the horse-chestnut, in quillai-bark or soap-bark, etc. By means of boiling alcohol it is readily extracted from the root of soapwort, the alcohol, as it cools, depositing the saponin as an amorphous sediment. It derives its name from its behavior with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken like a solution of soap, if even one one-thousandth part of saponin be present. Its solution, or an infusion of soapwort, is sometimes employed in place of a solution of an alkaline soap for cleansing the finer varieties of wool from grease. Many preparations for cleaning kid gloves, etc., derive their virtues from saponin.

SAPOTACEÆ, sǎp-ô-tă'sē-ē, a large genus of trees and shrubs of the heath tribe, indigenous chiefly to the tropics and principally to the tropical islands. The leaves are entire, alternate and leathery, with flowers clustered in the axils of the leaves, or at the older stem-nodes. The flowers are regular, bisexual, with stamens borne on the corolla, as many, or twice as many, as its lobes; the calyx-lobes are rigid and obtuse, and longer than the corolla-tubes; the fruits are baccate. The *Sapotaceæ* have a milky juice which furnishes true gutta-percha (q.v.). The sapodilla and star apple of the West Indies are fruits produced by this family. The genus *Bassia* contains species valuable for the oils which they yield and the seeds of *Mimusops elengi* also yield oil abundantly. The sapotads are natives chiefly of tropical India, Africa and America; known genera 21, species 212. Consult Gray, 'School and Field Book of Botany' (1875).

SAPPAN-WOOD. See BRAZIL-WOOD.

SAPPHIRE, a mineralogical name including all highly colored and transparent varieties of corundum (q.v.), except the red, which is called ruby, an exception confined chiefly to jewelers. Sapphire corundum occurs in three forms—as small, distinct crystals, hexagonal or rhombohedral in various modifications; as transparent portions of ordinary corundum; and at times as nodules or small rounded masses enclosed in ordinary corundum, though distinct. Most gem sapphires are of the first kind; but some fine stones have been cut from material of the two latter kinds, especially in the corundum workings in North Carolina, notably the Culsagee mine in Macon County. Sapphires present almost every variety of color, although blue is the most familiar, deep shades being most valued. Other blue gems occasionally seen

are blue tourmaline (called Brazilian sapphire), cyanite and iolite, which is known somewhat as water-sapphire. True sapphires are, however, easily distinguished by their greater hardness (9), and density (3.95 to 4.1). The main sources of sapphire are Ceylon, Cashmere and the Pailin district of Siam, also the Anakie district of Queensland, Australia. In the United States, sapphires are obtained chiefly in Montana; first from the "bars" or low bluffs, of gold-bearing gravel, along the Upper Missouri River, east of Helena and later from a decomposed igneous dike at Yogo Gulch, in Fergus County; also at Rock Creek, Granite County and Dry Cottonwood Creek, Deer Lodge County. The river bars and Rock Creek yield a great variety of rich and delicate colors, as in Queensland, but Yogo Gulch furnishes the deep blue shades most valued and is being worked very extensively. Small and poorly colored stones are largely sold for watch-jewels. All blue and green sapphires, like rubies, possess marked dichroism, a point important to the lapidary, as the tint of gems from such crystals depends upon the direction in which they are cut. In biblical history the sapphire was a stone of an azure color (Exod. xxiv, 10) and very precious (Job xxviii, 16). It was the second stone in the second row of the high priest's breastplate, which is now believed to have been the *lapis lazuli*, and not the modern sapphire, as doubtless was also the stone mentioned in Rev. xxi, 19. Among the Greeks the sapphire was sacred to Jupiter. See PRECIOUS STONES.

SAPPHO, sǎf'ô, Greek poetess: b. Mitylene, or Eresus, Island of Lesbos. She was the greatest of ancient poets of her sex and flourished between 630 and 570 B.C., being a younger contemporary of Alcæus. Little is known certainly of the events of her life. On account of political commotions she left Lesbos for Sicily. But in later years she returned to Mitylene where she became the centre of a female coterie, a school of poetry of which the famous Erinna was a member. She was the author of various poems; hymns, odes, elegies, epigrams—of which only two complete pieces, an ode 'To Aphrodite' and 'To a Maiden,' together with some fragments, have come down to us; these display intense feeling, glowing imagination and a high finish. One of them is quoted in full by Longinus in his treatise 'On the Sublime.' She is said to have invented several metres; at least one still bears her name and has been used by such ancient poets as Horace and such modern ones as Canning in his 'Needy Knife-grinder.' There is an edition of the extant fragments with translations and memoir by H. T. Wharton (3d ed., Chicago 1895). Ancient papyri have recently brought other fragments of Sappho's verse to light. Consult Bergk, 'Poetæ Lyric' (Vol. III, Leipzig 1914); Edmonds, J. M., (in *Classical Review*, Vol. XXII, Vol. XXVIII, London 1909 and 1914); *Classical Quarterly* (Vol. III, ib. 1909); Hunk, A. S. (in *Classical Studies*, Vol. IX, p. 39, ib. 1915) Brandt, P., 'Sappho' (Leipzig 1905); Christ-Schmid, 'Geschichte der Griechischen Literatur' (6th ed., Munich 1912); Farnell, G. S., 'Greek Lyric Poetry' (London 1891); Wright, W. C. 'Short History of Greek Literature' (New York 1907).

SAPPHO. Following the success of his first great tragedy of Fate, 'Die Ahnfrau,' which was written in 16 days, Franz Grillparzer wrote a second poetic drama 'Sappho' (1819), also composed at white heat and resembling 'Die Ahnfrau' in the general character of its poetry although differing from it in form and spirit. In its conception it is half way between the tragedy of fate and the modern tragedy of character; in its form, too, it is half way between the classical and the modern. Out of the slight tradition which tells how Sappho, one of the greatest poets of her age, threw herself from the high Lesbian cliffs into the sea when she found her love for the youth Phaon unrequited and her own handmaiden preferred, Grillparzer has made a stirring drama, with an acting quality strong enough to carry it to success on the stage when well performed. At the same time he has developed a poetic symbolism in the story, and the conflict between the spiritually gifted Sappho and the beautiful Melitta becomes, in Grillparzer's hands, the conflict between art and the pleasures of life. Although the verse has neither the dignity nor the sheer beauty of some of Grillparzer's later work, notably 'Des Meeres und der Liebe Wellen,' it has the cumulative quality which often accompanies verse written in long stretches at a single sitting, a quality which does not detract from its distinctly dramatic value. Through the dignity and the success of his early dramas Grillparzer forged the link that bound the drama of Austria definitely to the literature of Germany.

EDITH J. R. ISAACS.

SAPPHO'S LEAP. See CAPE DUCATO.

SAPRÆMIA. See BLOOD-POISONING.

SAPROLEGNACEÆ. See FUNGI—*Water Molds.*

SAPROPHYTES, a class of plants living on the carbonic compounds resulting from the decay of organic life. They sometimes contain chlorophyll, but generally do not, and since organs of assimilation are therefore not necessary, the leaves in many kinds are reduced to mere scales. This habit of existing only on decaying organisms makes the higher saprophytic plants very difficult to transplant. Algæ are often saprophytes, making use of the decaying refuse of the sea; and fungi, especially the molds and dung-loving genera as *Splachnum*, are the most generally known cryptogams acting as scavengers in this manner. Even the globular alga, the "red snow" (*Sphaerella nivalis*), exists on the corpses of insects, pollen-grains and other decaying materials drifting across the snow. Certain other saprophytes attach themselves to the bark of trees, not to suck the juices of the host in the manner of parasites, but to subsist on the decaying bark and on the organic dust and material in solution washed down by the rain and stopped by the projecting mass of the plants. Many saprophytic plants living in the cracks of rocks have only the humus collected in tiny pockets and the supply of dissolved organic matters in percolating water, to draw upon. Some orchids, as the coral-roots (*Corallorhiza*), that have no true roots, but a thin-skinned rootstock, which absorbs nutriment directly; the familiar Indian pipes (*Mono-*

tropa) and others spring from the humus of decaying leaves, in close connection with the hyphæ of fungi. The meadow pastures support such saprophytes as the true mushroom (*Agaricus campestris*), the moonwort (*Botrychium lunaria*) and the blue and violet flowered gentians. These micro-organisms, non-virulent and always present in animal intestines, may in certain conditions become virulent poisons. See BOTANY; FUNGI.

SAPSUCKER, the popular American name of several small woodpeckers, but properly restricted to the yellow-bellied woodpecker (*Sphyrapicus varius*), an Eastern species represented in the Rocky Mountain region by variety *nuchalis* and along the Pacific Coast by variety *ruber*. This woodpecker is of moderate size; is black and whitish above; black on breast; rump black and white mixed; belly more or less yellowish; sides streaked with dusky; crown red in the adult; chin scarlet and throat black in the male, but both white in the female. This bird illustrates well the curious tendency toward increase of red in plumage toward the Pacific Coast. In variety *nuchalis*, the nuchal band is red instead of brown, extending the chin red by so much; in specimens from Nevada, the scarlet area is still larger; and in the Coast form (*ruber*) the whole head, neck and breast are red, sometimes obliterating the normal pattern. This woodpecker is migratory, spending its summers and breeding only in the cooler parts of the United States and northward, and going South in midwinter. Its habits differ from those of other woodpeckers mainly in its custom of drilling a great number of holes in the bark of trees, to get at and eat the new wood and sugary sap lying beneath it. In many cases serious harm is done to fruit trees by the great number of chains of holes so bored, although many harmful insects are also devoured. See WOODPECKERS, and consult authorities cited thereunder.

SAPUCAIA (săp-oo-kiä) or **PARADISE NUTS**, the seeds of *Lacynthis zabucayo*, or sometimes those of *L. ollaria*, belonging to the *Myrtaceæ* and closely allied to the Brazil nut. The trees, often 75 feet high, grow abundantly in the northern part of South America. The nuts which have a sweet almond-like flavor are more wholesome than Brazil nuts. They are about two inches long and an inch thick, with a corky shell furrowed lengthwise, and are found in hard urnshaped fruits, six inches across and with a woody wall half an inch thick. These curious, very hard capsules, have lids which fit closely, but fall off when quite ripe. Like the fruits of other members of the genus they are called monkey-pots, perhaps not only on account of their shape, but because monkeys are said to be very fond of the seeds, which are scarce for this reason. An edible and soap-making oil, which soon grows rancid, is expressed from sapucaia nuts.

SAPULPA, sa-pul'ua, Okla., city and county-seat of Creek County, 102 miles northeast of Oklahoma City, on the Saint Louis and San Francisco Railroad. It is the centre of a region producing oil and natural gas in great quantities and of a rich agricultural region. It has oil refineries, railroad repair shops, glass plants, cotton gins, machine shops and

manufactories of bricks, candy, cigars, ice, oil-well supplies, etc. The city has 10 miles of paved streets, a large passenger railroad station, modern electric light and power plant, an electric street and interurban railway, a water-supply system owned by the city, storm and sanitary sewer system, several churches of the principal religious denominations, fine high school building, four ward schools, manual training and domestic science building, Colored Baptist College and district school, and the Euchee Indian Mission. There are four banks with over \$4,000,000 on deposit and two daily and three weekly newspapers. The freight receipts, an index of the city's manufacturing strength, average \$3,000,000 annually. Pop. 16,000.

SARA, sa'ra, Philippines, pueblo, province of Iloilo, Panay; in the district of Concepción, two miles northwest of the town of Concepción. Pop. 11,300.

SARABAND, a dance, said to be derived from the Saracens. Its character is grave and expressive. It originated in Spain, where it was formerly danced to the castanets. Handel, Bach and other masters frequently wrote tunes of this description for the harpsichord or clavichord. It became popular in Europe in the 16th century, but was prohibited for a time in Spain because of its indecency. The name is used now to denote a musical composition written for the saraband.

SARACENIC ARCHITECTURE. See MOHAMMEDAN ART.

SARACENS, sār'a-sēnz, a people mentioned by Ammianus Marcellinus as inhabiting the northern district of Arabia Felix. At the period of the Crusades the term was employed to designate all infidel nations, against which crusades were preached; and in course of time it became the generic name of all the Arabian tribes who embraced Mohammedanism and extended their conquests in Asia and Africa.

SARAGOSSA, sār-a-gōs'a, Maid of, Spanish heroine; d. Ceuta, Spain, 1857. Her name was Augustina and she was a vivandière in the Spanish army. During the siege of Saragossa (1808-09) she distinguished herself on several occasions in battle and was made a sub-lieutenant. Her praises are sung by Byron in 'Childe Harold,' canto i, 54-56.

SARAGOSSA, or **ZARAGOZA**, thā-rā-gō' thā (ancient CÆSAR-AUGUSTA), Spain, (1) Capital of a province of its own name and of the ancient kingdom of Aragon, situated on the river Ebro, in a fertile plain, 174 miles northeast of Madrid. The town is highly picturesque with its forest of towers, cupolas and spires, the houses of solid masonry highly ornamented, a city of castles and palaces. Many of the chief buildings were destroyed by the French invaders. Others deserving notice are the exchange (1551); the Torre Nuevo; the old citadel, Aljaperia, built by the Moors; hospitals, numerous churches and charitable institutions, town-house, new university, schools of medicine, theology, etc., many monastic institutions, theatre, bath, museum, bull-ring and botanical gardens and promenades. Agriculture is the principal occupation of the inhabitants and the industries include machinery and iron foundries, tanneries, carriages, pre-

serves, breweries, glass, candles, soap, liqueurs, distilleries and porcelain. Some of the articles referred to are imported besides rice, dried cod, bar-iron, timber and dye-stuffs. The exports consist chiefly of chocolate, paper, cast iron, wool, hats, dyed silks, soap and especially wheat and flour—mainly to Catalonia. Saragossa was the *salduba* of the Celt-Iberians, but the walls are all that remain of the ancient city. It renounced paganism at an early period and Aulus Prudentius, the first Christian poet, was born here in 348 A.D. It suffered from various wars, and in 1808 sustained two memorable sieges, costing 60,000 lives, but finally capitulated to the French.

(2) The province of Saragossa contains 6,607 square miles. The highest elevation is 7,700 feet. On the northwest are the spurs of the Pyrenees. The Ebro, Jalon, Huerva, Aguas, Arva and Gallego and part of the Aragon are the chief streams. The lower mountain slopes are covered by forests. The soil in the plains is fertile, producing wheat and other cereals, flax, hemp, oil, wine, etc. Silk-worms are reared, sheep are bred. The growing industries include paper, leather, soap, brandies, liqueurs, machinery, various kinds of carriages, railway material, pianos, beds, glass, bronze, chocolate, jams, woolen and linen goods and foundries. Several railways and a canal connecting the Atlantic and Mediterranean are the chief ways of communication. Pop. about 433,000.

SARAH (Heb. "Princess"), the daughter of Terah, half sister and wife of Abraham, who in her 90th year bore to him a son, Isaac, according to the promise of God. She died in Hebron at the age of 127 years. See ABRAHAM.

SARANAC (sār'a-nāk) **LAKE**, N. Y., village in Franklin and Essex counties, on Lake Saranac, and on a branch of the New York Central and Hudson River and the Chateaugay railroads, about 70 miles south by east of Malone. The village is in a part of the Adirondack region noted for its healthfulness and the beauty of the scenery. The hunter and lumberman settled here in 1860-70, but the railroad brought the health and pleasure seekers in great numbers. In the vicinity are the Trudeau and the Gabriel sanatoria for consumptive patients. The principal public buildings are the hotels, the churches and the schools. The government is vested in a village president and a board of trustees. Pop. 4,983.

SARATOGA, The, a former wooden sailing ship of the United States navy; displacement, 1,025 tons. Sailing ships of this class are fast disappearing from the navies of the world, but for training the young apprentice into an able-bodied man-o'-war's man there is no better school.

SARATOGA, Battles of, two battles of the American Revolution, called also the battles of Bemis' Heights, or of Stillwater, fought on ground about 12 miles east of Saratoga Springs and near the Hudson River. Both battles were fought under the same officers, the Americans being commanded by Horatio Gates (q.v.), who was ably served by Benedict Arnold and Daniel Morgan (qq.v.), and the British by John Burgoyne (q.v.). The first battle, 19

Sept. 1777, was indecisive. Burgoyne, having crossed the Hudson on the 13th and 14th, and encamped on the heights and plains of Saratoga, confronted Gates' army on Bemis' Heights at Stillwater, which the Americans had strongly fortified. About 4 p.m. on the 19th the American left wing, under Arnold, was attacked by Burgoyne's right. The engagement lasted until dark, and both sides claimed the victory. The British held the field, but Burgoyne had failed in his attempt to flank the American position. The British loss was more than 500 men, while that of the Americans was under 400. Burgoyne, whose communications with Canada were cut off, was now placed in peril through the capture of his supply-boats by Lincoln in his rear. Having reason, however, to expect that Sir Henry Clinton would come up the Hudson to his assistance, he fortified his position and waited. But in view of the non-arrival of Clinton, of the shortness of his own supplies, and of the difficulty of retreat, Burgoyne was forced to risk another battle. Advancing, 7 October, with 1,500 men and six pieces of artillery, he was attacked on the right by Morgan's riflemen and a New Hampshire brigade, while Arnold, without orders, and in defiance of Gates, pressed to the front and assumed actual command of the Americans, leading them in a determined assault upon the British lines. The Americans were reinforced at the critical moment, the British again and again gave way, and the battle ended in their retreat with loss of their artillery. In this engagement the British general Simon Fraser was mortally wounded, and Arnold received a severe wound in the leg. The Americans, animated by success, pursued Burgoyne's men, assaulted furiously, and gained partial possession of their camp. This battle like the first, ended with darkness. During the night, while the American forces lay on their arms, Burgoyne withdrew to the heights in his rear, not far to the north, and on the following day, to avoid capture, he retreated to Saratoga. After vainly waiting again for aid from Clinton, being still nearer the end of his provisions, exposed to the American fire, and finding further retreat impracticable, Burgoyne proposed a cessation of hostilities. He refused Gates' demand for unconditional surrender, and Gates modified the terms, which finally provided that the British should march out with the honors of war, and should freely take passage for England, on condition of not again serving against the American army. Congress failed to ratify this agreement, and the captured British, with the exception of Burgoyne and a few other officers, were held as prisoners until the end of the war. The troops surrendered numbered 5,791. An artillery train of 42 guns, more than 4,500 muskets, and a great quantity of ammunition were taken.

SARATOGA LAKE, a lake in Saratoga County in New York State, about four miles east of Saratoga Springs. It is a favorite place for regattas; it has a straight-away course three miles long and is wide enough to accommodate eight racing sculls abreast. In one of the intercollegiate regattas held here, 16 college crews competed, and had ample room. A steam railroad and electric cars extend from the "Springs" to the lake. In the summer it is a favorite resort for fish and game dinners.

SARATOGA SPRINGS (from an Indian word meaning "Hillside of the Great River"), N. Y., city in Saratoga County, on the Delaware and Hudson, the Boston and Maine and the Adirondack railroads, 38 miles north of Albany and 185 miles north of New York. It is easily accessible to many of the large Eastern cities, the "Saratoga Special" making the run from New York in four hours; Boston may be reached in six hours; Albany and Troy one hour; from Buffalo, Rochester, the Adirondacks, the Green Mountains, the White Mountains and many other places fast trains are run, especially in the summer season. It is a remarkably healthful place and all precautions known are used to keep the water pure and the sewerage system free from defects. The missionaries were the first known white men to visit this region. In 1684 the land now constituting Saratoga Springs and adjacent counties was ceded to the Dutch by the Indians. The first white owner of the now celebrated "Springs" was Rip van Dam, and Sir William Johnson (q.v.) was the first who had the efficacy of the waters tested. In 1774 the first hotel was erected. The "Springs" have made for the place a world-wide reputation. Thousands come to this city each year to use the waters, making the city one of the most popular health resorts in the country. Since 1826 the waters have been bottled and sent to various parts of the world. The Saratoga battlefield, the scene of the surrender of Burgoyne to Gates, 17 Oct. 1777, is 12 miles east of the city.

Saratoga Springs is situated on the southernmost spur of the Adirondacks, at an elevation of more than 300 feet above tide-water. The region around has practically no swamps nor marshes; the rainfall is moderate and the winters cold, the summers mild and pleasant. There are but few manufacturing establishments and the region around is composed largely of productive farms. The mineral springs are about 50 in number, 40 of which are well known. The most frequently visited and the waters of which are most extensively used are the Congress, Vichy, High Rock, Arondack, Hathorn, Patterson, Re-Mo-Ho, Red, Magnetic, Columbian, Geyser and Excelsior. The waters are cathartic, tonic, alterative and diuretic. The springs are in three groups: one about a mile south of the city, one a mile north of the city and the largest number within the corporate limits. The Saratoga Racing Park is a mile from the centre of the city. A paved sidewalk leads to the entrance gates. Polo Park, the golf links ground and other grounds furnish opportunity for outdoor sports. Saratoga Lake (q.v.) is about four miles distant.

The principal public buildings are Convention Hall, which seats 5,000 and which cost \$100,000; the town-hall containing the theatre, a State armory and the hotels. The hotels of the city have on several occasions accommodated 40,000 guests. On account of its spacious hotels and its convention halls, it is a favorite place for conventions. There are 18 church buildings, representing eight different denominations. The educational institutions are the Skidmore School of Arts, a high school, public and parish elementary schools, several private schools, a public school library, the McMillan

Reading Circle Library and the Athenæum. The charitable institutions are the Saratoga, Saint Faith and Saratoga Cure hospitals, Home of the Good Shepherd, Saint Christina Home and the Children's Home. The State of New York has established a reservation about the mineral springs. It was established in 1909 and is maintained and operated by the State Conservation Commission. Approximately 550 acres of land are included within it. Upon this property are 122 natural springs and wells, including practically every naturally mineralized and naturally carbonated water in the Saratoga region. The purpose of the State in assuming control over the Saratoga springs was to stop their commercial exploitation for carbon dioxide gas and to ensure the flow of their curative waters continuously for the benefit of the public. There are three parks upon the State Reservation, Geyser Park, High Rock Park and Lincoln Park. At three different places upon the State Reservation bath houses are conducted for administering various courses of treatment. They are run in accordance with the highest standards of the medical profession and many of the baths are given only under physicians' prescriptions. At the Lincoln Park bath house are two large, outdoor, fresh-water swimming pools which are well patronized in the summer months. The Saratoga bath house, in the centre of the city, is operated throughout the year, and every treatment may be obtained here. The Lincoln and Washington bath houses are operated all summer and as late into the fall as the demand for them continues. The Washington bath house, erected in 1919, is the largest and most completely equipped mineral-water bath house in the United States, with facilities for every important hydrotherapeutic treatment.

The two banks have a combined capital of \$225,000 and a surplus of \$200,000. The annual receipts and expenditures are each about \$125,000. The hotels expend during the summer season about \$40,000 for orchestral music. The city expends a large amount on the streets, keeping them clean and in good repair. Since 1915 the commission form of government has been in operation. In that year a city charter was granted. Pop. 15,000.

SARATOV, sā-rā'tōf, Russia, (1) Capital of the government of the same name, on the Volga, 459 miles southeast of Moscow, in a fertile valley, surrounded by lofty hills. It is one of the most important and best-built cities of eastern Russia. It occupies terraced slopes, intersected by ravines, dividing the city into three parts. It contains 30 churches, besides a public library; a fine art gallery; an excellent theatre; a school of drawing; primary and technical schools, and is the seat of several important courts and public offices. There are manufactures of cordage, bells, pottery, tiles, soap, tobacco, textiles, flour, oil, etc. The trade is chiefly transit by the Volga, between Moscow and Astrakhan. The industrial works comprise flour-mills, iron and oil works, works for the manufacture of railway plants, and tobacco factories. There are extensive distilleries and manufactures of liqueurs. Agriculture and gardening are the chief occupation of a section of the population. Pop. 217,418.

(2) A government of southeast Russia, on the Lower Volga, with an area of 32,624 square

miles. The surface is diversified by numerous hills with intervening valleys and many streams which with a mild climate and good soil contributes to rich pastures and munificent crops. There is a scarcity of timber. The chief exports are corn, flour, hemp, flax, tobacco, hops and madder. Wheat, oats, rye and tobacco are the principal crops. The mulberry is cultivated for rearing silkworms. Most of the inhabitants are Russians, although there are many Finns, Tatars and Germans, etc. Bee-keeping is a thriving industry. The value of the manufactures is approximately \$12,000,000 yearly. The colonists have much improved industry by their labor and example. Pop. 3,156,100.

SARAVOFF, sā-rā'vōf, Boris, Bulgarian soldier, leader in the Macedonian revolutionary committee: b. Turkey, about 1870. He studied in the military academy at Sofia, obtained a lieutenant's commission in the 1st Bulgarian infantry, in 1895 resigned his commission to devote himself to the cause of the Macedonian revolutionists, and performed many daring exploits in that service. His death was frequently reported in the press.

SARAWAK, sā-rā-wāk', Borneo, East Indies, an independent state, governed by an Englishman with the title of rajah, and now under British protection. It is situated on the northwestern side of the island, and its coast extends from Cape Datu on the southwest to Brunei Bay on the northeast, having a length of about 400 miles; the inland boundary is mainly formed by the Dutch territories, while in the northeast is the independent sultanate of Borneo proper, also now under British protection. The area of Sarawak is about 42,000 square miles and the population about 500,000. The shore is generally low and undulating, but immediately behind it the ground rises rapidly and becomes mountainous. The principal rivers are the Rejang, Baram, Batang, Lupar and the Limbang. The climate is equable. The soil is very productive, and sugarcane grows readily even without cultivation. Cloves, nutmegs and cinnamon thrive well; the more important vegetable productions are cocoanuts, rice and sago. Metals, particularly gold, antimony, silver, quicksilver and nickel, are very abundant and are worked to a considerable extent. Diamonds and other precious stones are also found, and excellent coal, favorably situated both for working and shipping. The original inhabitants are Dyaks, but are now intermixed with Malays and Chinese. They had made considerable progress in civilization. Owing to misgovernment and marauding expeditions for the purpose of obtaining slaves and other plunder they were in a wretched condition till Sir James Brooke was appointed rajah by the Sultan of Borneo in return for distinguished services in quelling disturbances and restoring order. Under his mild yet vigorous administration a happy change was produced, and extended its benefits beyond Sarawak to the adjoining territories. Sir James Brooke, who died in 1868, was succeeded by his nephew, Sir Charles Brooke. The exports consist chiefly of gutta-percha, sago, gambier, pepper, dried fish, edible birds' nests and antimony.

The seat of the government is at Kūching, on a river of the same name. It consists of a native and a European town. Pop. est. 25,000. A battery commands the reach immediately below the town, and there a number of Chinese houses have been built. The trade of the town is considerable, and is carried on chiefly in large boats, some of them of 100 tons, which sail annually to Singapore with sago and other productions of the coast, receiving in exchange European goods, Japanese cloths, brass-work, and coarse earthenware, made in China. The revenue is derived chiefly from customs and the opium, gambling, arrack and pawn farms, exemption taxes payable by Malays. There are import duties on tobacco, salt, kerosene, wines, etc., and export duties on sago, gambier, pepper, jungle produce, dried fish, etc. The revenue is \$900,000 annually and the expenditure about \$750,000. Imports annually amount to about \$4,000,000 and exports to \$5,500,000. There are military and police forces, the former consisting of 500 Dyaks under an English army officer. There are 23 post offices and wireless stations are located at Sadong, Sibuan and Miri. Straits Settlements currency is in use, of which one dollar is equivalent to 58 cents of United States currency. Consult Baring-Gould, S., and Bampfylde, C. A., 'History of Sarawak' (London 1909); Low, Sir H., 'Residence in Sarawak' (ib.); Rane of Sarawak, 'My Life in Sarawak' (ib. 1913); Roth H. Ling, 'The Natives of Sarawak and British North Borneo' (2 vols., ib. 1896); Saint John, Sir S., 'Life of Sir Charles Brooke, Rajah of Sarawak' (London 1879); 'Rajah Brooke' (ib. 1899).

SARCEY, sār-sā, Francisque, French journalist and dramatic critic: b. Dourban, 8 Oct. 1828; d. Paris, 15 May 1899. After several years spent in general journalistic work he became dramatic critic for 'Le Temps' (1867), and in this position, which he held until his death, was a dictator of dramatic criticism, his word being accepted as final by a large part of the public. He was the author of 'The Word and the Thing' (1862); 'Le Siège de Paris' (1871), which reached 30 editions in its first year; 'Etienne Moret' (1875); 'Comédiens et Comédiennes' (1878-84); 'Souvenirs de Jeunesse' (1884); 'Souvenirs d'Age mûr' (1892); 'Quarante Ans de Théâtre' (1893).

SARCINA, sār-sī'na, a genus of microscopic fungi, consisting of cubic or prismatic masses, made up generally of 8, 16 or 64 rounded, cubic cells, the faces of each cell being divided into four frustules or projections by two light grooves which cut each other at right angles. Each cell has a diameter of about $\frac{1}{10}$ to $\frac{1}{12}$ of a line, and consists either of a completely homogeneous mass only, without nucleus or granulations, or of such a mass with four, sometimes two or three nuclei. The cells are separate from each other by rectangular striæ. Sarcinæ are found sometimes in considerable quantities in the vomitings of persons ill with chronic affections of the stomach, in the fæces of chronic diarrhœa, etc.; they have likewise been detected in the stomachs of rabbits, dogs, tortoises and other animals; in the urine; in the pus of gangrenous abscesses; in the bones, etc. The appearance of sarcinæ in vomitings indicates a particular form of dyspepsia, for which the best-known remedy is sulphate of

soda, 10 grains to one dram, dissolved in water, and taken soon after a meal. The genus *Sarcina* is closely allied to that of *Bacterium*. See BACTERIA.

SARCINE, hypoxanthine, $C_5H_4N_2O_6$, a weakly basic organic substance closely related to xanthine and to uric acid. Found in the muscle juice and in many other fluids of the body. Colorless crystalline needles, slightly soluble in cold water, more so in hot. Unites with acids and certain metallic oxides to form compounds many of which are crystalline.

SARCODINA. A class of unicellular organisms (protozoa) that are without an external membrane or cell wall. During the active, or vegetative stage of existence they form pseudopodia, processes of the protoplasmic body substance by which locomotion is achieved and food material seized and taken in. For protection many of them construct a shell of lime, silica or chitin though a few cement together fragments of foreign material to form such a test. The common ameba, very similar in general structure to the white blood corpuscles, is usually regarded as a typical representative of the group. It illustrates the simplest forms in that no skeleton or other specialized structures are present although at certain times a temporary cyst wall is formed as a protection against cold or drought, or during spore formation. The character of the pseudopodia and of the shell are the main factors utilized in distinguishing the subdivisions of the class. Certain amebæ are parasitic and are indistinguishable in general structure from the free-living species. They are indeed doubtless descended from slime-inhabiting forms which would require very little physiological modification to adapt themselves to parasitic existence in the intestine.

Most species exhibit under a high power a narrow marginal zone of clear material the hyaline ectoplasm which includes a more fluid granular endoplasm. The latter is in constant movement and contains food particles, non-contractile vacuoles, reserved materials, waste products, and one or more nuclei. The contractile vacuoles are located at the indefinite boundary line between the ecto and endoplasm. They are, however, rarely found in parasitic species.

Multiplication is ordinarily simple cell division. The periodic encystment is usually accompanied by formation within the cyst of numerous swarm spores by multiple division. In some cases and perhaps always before encystment two individuals come together with an exchange of nuclear substance or complete fusion as a preliminary to the rapid division that produces the numerous spores. Such swarm spores are very minute. In parasitic species they are the elements for the infection of new hosts and this is brought about ordinarily by the transfer of ripe cysts, or less easily of the vegetative state of the organism.

Differentiation of species is very difficult and demands knowledge of the cyst and of details of spore formation. Many amebæ in vegetative form are merely developmental stages of other organisms and even those which are properly members of the group of Sarcodina are so similar that accurate differentiation is not yet possible in most cases.

The parasites of amebic dysentery have been known since 1860 but the form known as *Endamæba coli*, which is believed by the majority of investigators to be harmless, has only recently been clearly differentiated from the pathogenic species *E. histolytica*. Both often occur together in the human intestine. While amebic dysentery is in general a disease of the tropics and subtropics the Mayo Clinic has tabulated within a short period over 500 cases which came from every northern State in the Union and from the Canadian Northwest. Infection in temperate regions is much less frequent than in the tropics whereas in the Philippines, e.g., careful reports show an infection of 37.5 per cent.

The free living Sarcodina fall chiefly in two orders. Among the most abundant of marine animals are the Rhizopoda whose calcareous shells also form large deposits in the rocks. The Radiolaria are equally abundant in the Pacific and connecting oceans as well as in fossil strata. These forms construct a skeleton of silica the form of which is characterized by sharp radiating spicules. The number and variety of these organisms is beyond conception. They form a considerable part of the bottom ooze found in the deep sea everywhere.

Other free living species are abundant in fresh water bodies and in fact occur in almost any moist environment. Recent discoveries have even disclosed the occurrence of enormous numbers of small amebæ in surface soils where they live in conjunction with various types of bacteria and are believed to play an important part in determining the fertility of the soil.

HENRY B. WARD,

Professor of Zoology, University of Illinois.

SARCOMA. See TUMOR.

SARCOPHAGUS, originally the name given to a kind of stone that used to be quarried at Assos in the Troad, and which was employed for coffins or tombs: a coffin made of this stone was supposed to possess the property of consuming within a few weeks a dead body laid in it: in Greek *sarkophagos* means flesh-consuming, or flesh-devouring. Sarcophagus is now used only in the sense of coffin or tomb made of stone, or of terra-cotta or concrete as in the case of the highly ornate tombs which are found among the remains of ancient Etrurian art. Some of the sarcophagi found in Egypt are contemporary with the pyramids: the earliest are squared or oblong, the later ones, whether plain or ornamented with reliefs, have the same shape as the swathed mummies. Phœnician sarcophagi were modeled like the mummiform sarcophagi of Egypt, and were of marble or basalt; some of them showed the principal contours of the body. Before cremation of the dead came into general use at Rome, the illustrious dead were deposited in massive sarcophagi; celebrated among these is the tomb of the Scipios; under the empire Roman sarcophagi were very elaborately ornamented after the manner of the Etrurians. In modern times deceased men of great eminence or great wealth are sometimes laid away in stone chests or sarcophagi. Consult Robert, 'Die Antiken Sarkophag reliefs' (Berlin 1897); Strong, 'Roman Sculpture' (London 1907); Fowler, 'Handbook of Greek Archeology' (New York 1909);

Myres, 'Handbook of the Cesnola Collection' (New York 1914).

SARCOPSYLLA, a genus of parasitic fleas which bury their heads in the flesh of their hosts and create bad sores. The most noted species is *S. penetrans*, the chigo (q.v.). In our southern States and elsewhere another species, the chicken-flea (*S. gallinaea*), buries itself in the eyelids of domestic fowls.

SARCOSINE, methyl glycocoll, methyl glycine, $\text{CH}_3\text{NHCH}_2\text{COOH}$, a substance discovered by Liebig in the decomposition product of the creatine obtained from meat extract. Later made by the action of methyl-amine on monochlor-acetic acid. A colorless crystalline compound easily soluble in water.

SARD, a translucent, reddish-brown variety of chalcedony, extensively used as a ring-stone. See CORNELIAN.

SARDANAPALUS, sār-da-na-pā'lūs (AS-SUBBANI-PAL) Assyrian king, ruled 668-625 B.C. He was the eldest son of Esarhaddon, grandson of Sennacherib, and great-grandson of Sargon. His father resigned the throne to him in 668 B.C., reserving only Babylon to himself. The following year the father's death left Sardanapalus sole ruler. Revolts being common upon a change of rulers, the attention of the new Assyrian king was called to the suppression of one in Egypt, where Tirhakah of Ethiopia had overthrown the system of princes tributary to Assyria. Tirhakah was driven southward out of Egypt after a disastrous battle, but his successor renewed the revolt and met with defeat. Thebes was robbed of an immense amount of treasures of art and wealth. Tyre also revolted, but after a prolonged blockade its king submitted. The kings of Arvad, Cilicia and Tabal were put in subjection, and Gyges of Lydia, who besought an alliance with Sardanapalus to aid him against his Cimmerian enemies from the Black Sea region, found he was accepted on terms which implied submission; and when later he assisted Psammetichus in throwing off the Assyrian yoke in Egypt he was destroyed by Sardanapalus. War broke out with Urtaku, king of Elam, who had made a raid upon Accad, ruled by the brother of the Assyrian king. It took a long struggle to complete the subjection of the country but it was accomplished finally during the reign of Teumman, Urtaku's usurping successor. After a great victory near Susa, Urtaku's sons were placed over the kingdom as Assyrian vassals. The decline of the empire began when the king's brother, Samas-sum-ukin (or Shamash-shum-ukin), ruler of Babylon, as vassal-king, instigated a revolt which was so widespread as to include Elam, Arabia, Egypt, Chaldaea and other Asiatic countries. Egypt alone under Psammetichus secured her independence. Babylon was taken after a long siege and Samas-sum-ukin perished in the flames of his burning palace. Between 646-640 B.C. Elam was subjugated and Susa, after being pillaged, was razed to the ground. Sardanapalus celebrated his victories in Arabia by a triumphal procession through Nineveh.

Assurbanipal figures in classical literature under the name of Sardanapalus and there is described as a mere sensualist. Though cruel and implacable to foes, he was an enlightened despot, and literature and art, particularly architecture, flourished in his reign and attained

their highest degree of perfection. The king collected a famous library of all the known cuneiform tablets. The remains of his splendid palace with its priceless library were excavated at Kuyanjk. The tablets now belong to the British Museum, and form the basis of our present knowledge of the civilization and history of Assyria. Consult Oppert, 'Histoire des Empires de Chaldée et d'Assyrie'; Lenormant, 'Manual d'Histoire Ancienne de l'Orient' (1869); Rawlinson, 'Five Great Monarchies of the Eastern World' (1879); and the works cited of A. H. Sayce (q.v.).

SARDINES (săr'dēnz') AND **SARDINE FISHERIES**. The name sardine is a general one applied to various small fishes of the family *Clupeidae* as well as, and less correctly, to the young of some of the larger species. "Thus, there are the Spanish sardine of the West Indies and Florida; the California sardine, found along the entire west coast of the United States; the Chile sardine; the oil sardine of India, and the sardines of Japan and New Zealand. But the sardine *par excellence* is the French sardine, so-called from the island of Sardinia, in the Mediterranean, about whose shores the fish are abundant." The sardine or pilchard (*Clupea* or *Clupanodon pilchardus*) is usually about five or seven inches long, of an olive-green color above and silvery on the sides and below, with very large easily displaced scales, only about 30 of which form a complete longitudinal row. The usual French sardines are the yearling fish of what becomes, when full grown, the pilchard of English fishermen, attaining a length of 8 to 10 inches. Geographically it ranges throughout the Mediterranean; in the Atlantic from Madeira to Ireland and in the North and Baltic seas. They feed on minute crustaceans, larval forms and floating fish-eggs, the only kind of food for which their nearly toothless mouths are adapted. The pilchard spawns throughout the summer in the open sea, laying about 60,000 buoyant eggs. On the coast of Brittany, where the principal fisheries are located, sardines are now caught throughout the summer, and to a less extent at other seasons, exclusively by means of gill-nets of very fine twine and small mesh, which varies to suit the size of the run of fish. These nets are dyed blue, partly to preserve, partly to render them inconspicuous in the water; and the schools of fish are tolled into them by means of a bait made of the salted roes of various fishes, chiefly cod. The nets are operated from small two-masted boats which never go beyond a few miles from the shore. The catch is brought ashore and a portion is consumed fresh, but the bulk is sold to the canning factories.

The fishes, when bought for curing, are first beheaded and then gutted, and sorted according to size. They are then washed in sea-water and dried by being suspended on wire screens, nets or willows in the open air, and are then plunged into a cauldron of boiling olive-oil. For the cheaper grades peanut or cottonseed-oil is used. The sardines are laid in the cauldron on wire gratings, two rows deep, and are kept therein until sufficiently cooked, when they are taken out and allowed to drip, the oil-drippings being carefully collected. They are packed in the tin cases, which are filled with oil, and sealed hermetically. Throughout the process

the greatest care is exercised to keep the fish in the best condition. The offal and waste of the sardine-curing industry is sold as manure to the farmers.

The sardine fishery is the most important fishery industry of France, employing before the war about 32,000 fishermen and more than 8,000 boats, and yielding an annual product of about 60,000,000 kilograms of sardines, valued at about 9,000,000 francs. At the last ante bellum enumeration about 15,000 persons were employed in the canning factories with an annual output of 4,000,000 or 5,000,000 boxes. The better grades are consumed in France, but the United States imports French sardines, chiefly of the cheaper grades. Sardines are also packed to a smaller extent elsewhere in Europe, especially in Spain and Portugal.

In the United States a true sardine (*C. caeruleus*) occurs on the coast of California and, judging from the results attained in the canning of small quantities, it promises to rival the French product in delicate flavor and industrial importance. But the principal sardine industry of the United States centres about Eastport, Me., where the young of the herring is packed. These fish are caught chiefly in brush weirs (see POUND-NET FISHING) and are sold to the canneries, where they are treated in general after the French method with some local modifications. Drying rooms or ovens are employed in place of the open air; when ovens are used the fish are not boiled in oil, but are at once sealed; cottonseed-oil is almost universally employed instead of olive-oil; and various labor-saving devices have been introduced. The product is distinctly inferior to the best or even middlegrade French sardine. Various special grades, put up in mustard, tomato sauce and spices, are also packed. The output of the 45 canneries in Maine is about 550,000 cases, valued at about \$2,000,000, annually.

SARDINIA, sār-dīn'i-a, **Island of** (Italian, SARDEGNA), in the Mediterranean Sea, south of the island of Corsica, from which it is separated by the Strait of Bonifacio, not quite seven miles wide, extends between lat. 38° 50' to 41° 15' N., and long. 8° 5' to 9° 50' E. It is 152 miles long from Cape Teulada in the south to Longo Sardo in the north, and has a central breadth of about 66 miles. Its total area is 9,299 square miles divided into two provinces of the kingdom of Italy (q.v.), Cagliari and Sassari, the former comprising the districts of Cagliari, Iglesias, Oristano and Lunesei, and the latter those of Nuoro, Alghero, Ozieri, Sassari and Tempio, named after the principal urban aggregations. The density of the population is 94.7 per square mile. Cagliari (q.v.) (pop. 59,600) is the capital. Before the consolidation of the Italian kingdom in 1861, Sardinia with its surrounding is-

lands, the principal of which are San Antioco, San Pietro, Asinara, Madalena, Tavolara and Caprera formed that part of the Sardinian states named the Kingdom of Sardinia. See SARDINIAN MONARCHY.

Topography.—The island is nearly in the form of a parallelogram. In a prehistoric age it was united with Corsica. The interior is generally mountainous, the great chain which traverses Corsica from north to south being evidently, notwithstanding the interruption of the Strait of Bonifacio, continued into Sardinia, where it usually follows the same direction, but occasionally sends out transverse branches east to west. The culminating point is the peak of Generagente, situated a little to the east of the centre of the island, which attains the height of 6,132 feet. Between the mountain ridges are several extensive plains, of which the most celebrated for beauty and fertility are those of the Campidano in the south, and of Ozieri in the north. There are several large sandy or stony districts called *macchie*, of a very sterile nature. The streams are numerous, and add considerably to the fertility of the districts through which they pass, but are of no navigable importance. The Tirsu, the largest, pours its waters into the Gulf of Oristano on the west coast. The lakes are situated chiefly in the vicinity of the coast, where they form a series of lagoons. Sardinia has a total coast line of 835 miles. The north coast is generally rugged and precipitous, presenting a succession of bold headlands. The principal bay is that of Porto Torres, in the Gulf of Asinara. The west coast is extremely diversified in character, rocky headlands (the principal of which is Cape Argentiera, 5,200 feet high), beaches, low hills, tablelands, open bays and bold islets succeeding each other. Guarding the strait of Bonifacio a group of fortified islands constitutes the naval station of Maddalena. Cape Teulada, nearly 900 feet high, forms the most southerly point of the island. Turning north from Cape Spartivento a number of rocky islets present themselves, lining a low and marshy beach, which continues almost unbroken. The Island of San Macario forms the southwest entrance of the Gulf of Cagliari. This gulf, besides having the capital situated on its northern shore, everywhere furnishes excellent anchorage in ample depth, and in the grounds along and behind it exhibits the best specimens of cultivation of which Sardinia can boast. The east coast, from Cape Carbonara northward, stretches nearly in a straight line, the continuity of which is seldom interrupted by indentations. The most conspicuous of all the headlands is that of Monte Santo, a rugged promontory upward of 2,400 feet high, sloping toward the sea, and terminating in bold precipices of limestone, within which is an extensive cave fantastically adorned with enormous milk-white stalactites.

Geology.—The greater part of the rocks are of crystalline texture and belong to the earliest formations, consisting of granite, overlain by gneiss and mica-schist. Trachyte, basalt and other rocks of volcanic formation are most largely developed in the Northwest, but also occupy a greater number of isolated spots throughout the island, and more especially in the southwest, where the adjacent islands of Saint Pietro and Saint Antioco are almost entirely composed of them. In many cases the

mouths of ancient craters and the lava-streams issuing from them can be distinctly traced. Sedimentary Silurian rocks break the continuity of the granite on the east, and a large tract in the southwest belongs to the same formation, extending in a southwest direction till it reaches the southern extremity of the island and forms the remarkable promontory of Teulada. The limestones and chalks at the top of the secondary formation are not largely developed, but occupy a number of isolated tracts both in the interior and on the coast. In the latter portion they form conspicuous objects in the northwest, where the cliffs to the north of the Gulf of Alghero are composed of them, and in the east, where they form the great mass of Monte Santo and contain its celebrated stalactical cave. Tertiary rocks of travertine, marl and sandstone occupy a considerable tract near the town and along the Gulf of Sassari, and also in the south, where they form the eastern boundary of the plain of Campidano. That plain itself, however, has a deep covering of alluvium, which partly accounts for its remarkable fertility. Similar tracts of alluvium, though of much more limited extent, are found in the Plain of Ozieri in the north and along the Gulf of Palmas in the south and that of Paglia in the southwest.

Minerals.—The mineral riches of the island were well known to the ancients, whose extensive workings can still be traced. Tradition enumerates gold among its metals, but no traces of it can now be found. Lead, however, exists in considerable abundance, and is generally highly argentiferous. Mines of it are profusely scattered over various districts. Zinc ore (calamine) is worked, also lead ore; and both are exported. Copper occurs in several quarters and occasionally furnishes beautiful specimens of malachite. Quicksilver has been found and was once partially worked, and both bismuth and antimony are said to exist; iron of excellent quality is plentifully distributed and is worked in several districts. The other mineral products deserving of notice are porphyry, basalt, alabaster, marble, volcanic enamels, rock-crystals and a variety of beautiful pebbles, lignite, gypsum and nitre. Salt, in its mineral form, is found only in the grottoes of Serrentu, but is extensively obtained from the salt-pans along the coast, and forms one of the most profitable sources of royal revenue, for the sake of which it is strictly maintained as a government monopoly. There are about 12,000 engaged in mining, and the island takes fifth place in this industry among the Italian provinces.

Climate.—The climate of Sardinia has for many ages borne a very bad name; at certain seasons large districts become so insalubrious as to be regularly deserted by their inhabitants, while in others the mortality is remarkably great. The range of the thermometer is between 34° and 90° and the mean annual temperature 61° 7". Hence neither heat nor cold can be said to be in excess. During the hot season, in the low-lying lands, miasmata are continually arising to taint the air, the malignant properties of which become so virulent at night or in the cool of the evening that the natives never quit their homes until an hour after sunrise and hasten to return before sunset, carefully closing every door and window. The disease which then prevails is

known by the name of *intemperie*, and is said to be even more fatal than the malaria by which parts of Italy and Sicily are infested.

Flora and Fauna.—The whole surface of Sardinia has been divided into three portions—one occupied by mountains, where not absolutely barren, is covered with forests or clothed with pasture; one occupied by marshes, lagoons and the almost sterile *macchie*, and one under tolerably regular culture, as arable land, oliveyard, vineyard, etc. See paragraph on *Agriculture*.

Game of all kinds is very abundant. Wild boars, stags, deer and muffs frequent the woods and forests; and foxes, hares and rabbits are so numerous that their skins furnish a considerable article of export.

Fisheries.—From the extent of seacoast the fisheries naturally form an important branch of industry, which, however, is almost entirely in the hands of strangers. The most valuable fishery is that of the tunny, which is carried on extensively on various parts of the coast. Anchovies and sardines, the latter at one time so numerous as to have derived their name from the island, have become comparatively scarce. Fine mullet, bream, eels and other fish abound, and are staple articles of consumption and commerce. The coral fisheries, more celebrated in ancient than in modern times, are still carried on on the western and southern coasts. The *Pinna nobilis* also, the inhabitant of a shell of from 15 inches to 27 inches in length, abounds in the smooth water of shallow bays, as at Porto-Conte and Liscia, and is the object of an important fishery, partly on account of the pearls, generally of very indifferent quality, obtained from it, and still more on account of its byssus, or tuft of silky hair, which is about eight inches long, and is spun into gloves, stockings or other articles of dress.

Ethnology.—The inhabitants resemble the Spaniards rather than the Italians in character. Their demeanor is grave and dignified compared with the vivacity of the Italians, and they are characterized by their unwavering fidelity to their sovereign, their chivalric sense of honor and their hospitality. They suffered much, however, from long neglect and misgovernment, are ignorant and bigoted, and when they have received an injury are insatiable in their thirst for revenge, but the celebrated blood-feuds are now uncommon and brigandage has ceased. With the exception of the inhabitants of Cagliari and Sassari, the two chief towns of the island, the Sardinians have as yet been little influenced by the modern advances of civilization, and in some remote districts the traveler may imagine himself translated to a period several centuries earlier.

Agriculture.—Much of the land is of remarkable fertility but the system of agriculture pursued is imperfect. The Italian system of partnership or *colonia parziaria*, more especially in *mezzadria*, consisting in a form of partnership between the proprietor and the cultivator, is practised to some extent. The grain raised considerably exceeds the consumption of the present inhabitants, and might easily be increased so as to supply three times the number. The whole operations of the farm are conducted in an antiquated manner. The principal crop is wheat, which is generally of ex-

cellent quality, and forms an important article of export in the form not only of grain but of flour, biscuit and macaroni. The culture of barley is more limited and the quality of the produce is comparatively inferior; maize thrives well, and though not yet a general crop is rising rapidly into favor; beans and peas are extensively grown both for home consumption and export. Dairy farming flourishes, the island being second of the Italian provinces in cheese production. The vine is well adapted both to the climate and the soil. The produce, however, is more remarkable for its quantity than its quality, all the preparatory processes being conducted in a careless and imperfect manner. The most esteemed wines are those of the Campidano, Alghero, Sorso and Ogliastro. Beautiful and extensive olive-grounds are met with in various quarters, but the culture might easily be extended and made much more profitable than it has yet proved to be. The best oil is that of Sassari. The only other crops deserving of notice are tobacco, which is grown to some extent in several districts, but particularly around Sassari, Alghero and the adjacent villages; linseed, which is produced in the greatest abundance in the neighborhood of Oristano; cotton, for which the soil and climate of the Campidano appear well adapted; madder, which grows wild in many parts of the island, and, though neglected, might easily be cultivated to great advantage; and silk, well fitted to become a staple product, but at present produced chiefly for amusement.

Industries and Commerce.—Manufactures have made very little progress and are chiefly confined to a few coarse tissues woven by the women at their homes for private use. Tobacco and gunpowder—both, like salt, government monopolies—are manufactured to a considerable extent. Industrial establishments number 4,015, with 34,016 employees, utilizing 13,064 horse power, according to available statistics. The trade consists of the exports of raw produce, the greater part of which have already been enumerated, including corn, wine, brandy, timber, seeds, fish, cattle, lead ore, calamine, salt, tobacco, etc.; the imports include all the ordinary tissues, more especially cotton, colonial produce, hosiery, hardware and metals, hemp and cordage, etc. One great obstacle to the progress of trade was the miserable state of the roads, but good roads have now been made and railway lines constructed. The coinage, weights and measures are the same now as those on the mainland.

Language, Education, Religion, Government, etc.—The language consists of a number of dialects differing widely in many of their roots; several of them closely resemble Spanish. Over 73 per cent of the inhabitants are unable to read or write. There are two universities, one at Cagliari and the other at Sassari. The people are Roman Catholics. Sardinia now has a provincial government similar to the rest of Italy.

History.—The early history of the island is involved in much obscurity. Its prehistoric monuments of the Bronze Age (2000–1800 B.C.) are of considerable archaeological interest. Its original inhabitants, according to Cicero of Libyo-Phœnician, and according to Strabo of Tyrrhene extraction, were living independent

when, about 530 B.C., they were attacked by the Carthaginians, and obliged, after a valiant but ineffectual resistance, to quit the low country and retire into their mountain fastnesses. During the first Punic War the Romans made strenuous exertions to become masters of the island, and ultimately, on agreeing to make peace, obtained a formal cession of it from the Carthaginians. This cession is mentioned by Livy as one of the causes which led to the second Punic War, in which Rome, though finally victorious, was brought to the brink of ruin by Hannibal. During the struggles between Rome and Carthage, Sardinia often became the theatre of war, and suffered equally from both the powerful states which contended for its possession. At a very early period the inhabitants were converted to Christianity. They passed successively into the hands of the Vandals, the Goths, the Longobards and Saracens. By the united efforts of the Genoese and Pisans the Saracens were ultimately expelled from the island, and then rival claims were set up for it by its liberators themselves. During the disputes that ensued some of the judges or governors succeeded in establishing themselves as independent princes. In 1297 Boniface VIII invested the kings of Aragon with Sardinia, and it continued in the possession of Spain till 1708, when it was taken possession of by the British. In 1713, in terms of the Peace of Utrecht, it was yielded to Austria. In 1720 it was ceded by Austria to Victor Amadeus II, Duke of Savoy, in exchange for Sicily. The Duke of Savoy thereafter assumed the title of king of Sardinia, which was finally exchanged in 1861 for that of king of Italy. Pop. 880,863.

SARDINIAN MONARCHY, a former south European kingdom, comprising Sardinia (q.v.) and its surrounding islands as the nucleate portion with several dependencies on the Italian mainland, which included the duchy of Savoy, whence came its kings; the principality of Piedmont; the county of Nice; the duchy of Genoa and parts of the duchies of Montferrat and Milan. These latter were divided for administrative purposes into 11 divisions—Turin, Genoa, Chambéry, Alessandria, Coni, Novara, Nice, Annecy, Ivrea, Savona and Vercelli. Previous to the annexation of its territories consequent on the events of 1859 (see ITALY), and the disjunction from it of the duchy of Savoy and the county of Nice, which, in the same year, were ceded to and now form part of France, comprised in the whole an extent of 28,229 square miles, with a population in 1858 of 5,194,807. A new constitution was voluntarily granted by Charles Albert in 1848, under

which two legislative chambers were introduced, freedom of the press conceded and important reforms carried through. Catholicism was the religion of the state, but all other forms were tolerated. The last Sardinian king was Victor Emmanuel II, afterward king of Italy, who succeeded to the throne in 1849. The royal title was King of Sardinia, Cyprus and Jerusalem, and Duke of Savoy. The crown-prince was styled Prince of Piedmont.

History.—The country which formed the Sardinian states was known in ancient times in its southern part by the name of Liguria, and in its northern part, bounded on the north by the Pennine and on the west by the Graian and Cottian Alps, by the name of Gallia Cisalpina. Savoy, separated from the other parts, and lying beyond the Alps, was considered as belonging to Gallia Narbonensis. From this remote corner of the territory sprang the present royal house of Italy. In the middle of the 11th century, Humbert, Count of Maurienne, a great vassal of Rudolf III of Burgundy, appears exercising jurisdiction not only over Maurienne, but various other parts of Savoy, the Lower Valais and Aosta. This jurisdiction was extended to the banks of the Po by Humbert's son, Otho, who died in 1060, leaving two sons, who became successively counts of Savoy. Under Amadeus III a long series of changes followed, during which the house of Savoy was sometimes brought to the verge of destruction, and at other times attained to such prosperity as to excite the jealousies or fears of neighboring states. One of the counts, called Peter, ruled from 1263 to 1268. He added the canton of Vaud to his dominions, and in many ways improved the fortunes of his house. Henry III of England, who had married his sister, made him Earl of Richmond, and gave him for residence a palace on the banks of the Thames, which hence took the name of Savoy House. Among Peter's successors the most distinguished are Amadeus V, whose prosperous rule, from 1284 to 1323, procured him the title of Great Amadeus VIII at the termination of his long reign of 49 years, in 1440, left his successor in possession of territories which gave him a distinguished place among the sovereigns of Europe. Being, however, interposed between France and Germany, they were often made the battlefield on which these great countries met to decide their quarrels. Notwithstanding this disadvantage, the house of Savoy, at the Peace of the Pyrenees in 1659, by which the wars of the French and Spanish monarchies were terminated, after they had raged for nearly 80 years, found itself under Charles Emmanuel II as great and prosperous as ever. He was succeeded in 1675 by Victor Amadeus II, during whose reign war between France and Germany again broke out. Amadeus became almost necessarily involved, but played his part so ably, that at the Peace of Utrecht in 1713 he not only added considerably to his continental possessions but obtained possession and was formally crowned king of Sicily. By a subsequent arrangement he exchanged Sicily for the Island of Sardinia, from which he and his successors took the title of king. On his death in 1730 he was succeeded by Emmanuel III, who became involved in the war of the Spanish Succession and saw his territories laid waste by contending armies. The Peace of Aix-la-

Chapelle compensated him by the addition of several important districts, and his own enlightened administration added greatly to the internal resources of his kingdom. He was succeeded in 1773 by his son Victor Amadeus III, who reigned till the French Revolution broke out; and was succeeded in 1796 by his son Emmanuel IV, who, after seeing his continental dominions overrun by the armies of the French, took refuge in the Island of Sardinia in 1799, and three years after abdicated in favor of his brother Victor Emmanuel, who remained in Sardinia till 1814, when he again fixed the seat of government at Turin. Shortly after the Congress of Vienna added Genoa to his territories. An insurrection led to his abdication in 1821 in favor of his brother, Charles Felix, whose reign of 10 years was marked by some important internal improvements. Having left no male issue, a collateral branch succeeded in the person of Charles Albert, who promulgated the liberal constitution of 1848, the provisions of which are referred to above. The same year saw him at the head of a league intended to expel the Austrians from Italy. The disastrous results led to his abdication in March 1849, in favor of his son, Victor Emmanuel II, and very probably to his death in the following July. Under the government of Victor Emmanuel the cause of progress and liberal institutions steadily advanced, some of the more important of the reforming measures being the establishment of universal toleration in religious matters, the suppression, with a few exceptions, of the monastic houses, and an unfettered freedom accorded to the press in the discussion of political matters. Such a development of liberal principles naturally proved extremely distasteful to Austria, whose arbitrary sway, exercised over the adjoining kingdoms of Lombardy and Venice, presented so marked and glaring a contrast. Frequent aggressive attempts were made by her, and pretexts sought for provoking hostilities with Sardinia; but the flame only burst out finally in 1859, when, in the month of April of that year, the Sardinian territories were invaded by an Austrian army. The war which then ensued ultimately issued in the establishment of the present kingdom of Italy, into which the Sardinian states have all been incorporated, with the exception of the duchy of Savoy and county of Nice, which King Victor Emmanuel was obliged, as before mentioned, to cede to France. (See ITALY). Consult 'Cambridge Modern History,' Vols. V-VI (New York 1908-09); Gallenga, A., 'History of Piedmont' (3 vols., London 1855); Ricotti, 'Storia della monarchia piemontese' (Florence 1861-69); Straforell, G., 'Sardegna' (Turin 1895); Sergi, G., 'La Sardegna' (Turin 1907).

SARDIS, sār'dīs, Asia Minor, the capital of ancient Lydia, stood at the foot of Mount Timolus (5,906 feet high), two and one-half miles south of Hermus. It was traversed by the Pactolus, which flowed through its marketplace. To-day nothing remains at its site (Sart) but a village and some ancient mounds. It was once a wealthy mart, the luxurious capital of the proverbially rich Cræsus, and carried on an enormous trade between the highlands and the coast. Its principal manufactures were

woolen goods and carpets. Its strong citadel was destroyed by the Cimmerian Gauls in the 7th century B.C.; by the Athenians in the 6th; by Antiochus the Great, 215 B.C., and by Timur in 1402. An earthquake overturned it in the reign of Tiberius. Xerxes and Cyrus the Great resided here before entering upon their great expeditions. The ancient cemetery is of vast extent, and there are interesting remains of the tomb of Alyattes and of the temple of Cybele.

SARDONYX, a variety of the mineral quartz, in which layers of sard (q.v.), each of even thickness, alternate with layers of white chalcedony. It was highly prized by the ancients for cameos, intaglios, seal rings and engraved gems.

SARDOU, sār-doo, Victorien, French dramatist: b. Paris, 7 Sept. 1831; d. there, 8 Nov. 1908. He was for a time a tutor of philosophy, mathematics and history, but soon began his literary career by writing for reviews and encyclopædias. His first play, 'La Taverne des Etudiants' failed at the Odéon in 1854, and for a time he abandoned the theatre. But ere long he was dramatizing again, and he won a popular success in almost every field of the drama save tragedy. He was elected a member of the academy in 1877. In the long list of titles are 'Les Pattes de Mouche' (1869); 'Les Prés Saint-Gervais' (1862); 'Nos Intimes' (1862); 'Les Vieux Garçons' (1865); 'Séraphine' (1868); 'Patrie' (1869); 'Le Roi Carotte' (1872), an *opéra bouffe*, set by Offenbach; 'Rabagas' (1872); 'L'Oncle Sam' (1873); 'Ferreol' (1875); 'Dora' (1877); 'Les Bourgeois de Pont-d'Arcy' (1878); 'Daniel Rochat' (1880); 'Divorçons' (1880); 'Odette' (1881); 'Fédora' (1882); 'Théodora' (1884); 'La Tosca' (1887); 'Cléopâtre' (1889); the series on the French Revolution, 'Les Merveilleuses,' 'Thermidor' (1891), and 'Robespierre,' the last written for Sir Henry Irving; 'Madame Sans-Gêne' (1893); 'Gismonda' (1894); 'Marcelle' (1896); 'Spiritisme' (1897); and 'Paméla, Marchande de Frivolités' (1898). Several of these from 'Fédora' onward, were specially written for Sarah Bernhardt (q.v.). In his comedy, Sardou revealed rapid movement, witty dialogue, frequently clever satire on contemporary matters, unconvincing character portraiture, loose construction and improbable episodes. His "historical" dramas aimed at the heroic, but were simply grandiose, their connection with authentic history being generally tenuous, their interest largely one of empty mechanical display. The last specimen, 'Dante,' presented in the United States by Irving in 1903-04, suffered from a lack of coherence. Sardou's dramaturgic skill was great, but his works had no literary value. Consult Montegut in the 'Revue des Deux Mondes' (1877); Matthews, 'French Dramatists' (1888); Sarrazin, 'Das moderne Drama der Franzosen' (1888); Doumic, 'Ecrivains d'aujourd'hui' (1895).

SARGASSUM, the most highly organized genus of the marine algæ, *Fulcaceæ*, or rock weeds. They are seaweeds which are either attached to stones by a discoid hold-fast or are floating, with long filiform stems, much branched and bearing long, narrow, leaf-like fronds with distinct midribs. The air-bladders are little, stalked globes, with slender project-

ing tips, and stand out from the axils of the fronds, like solitary grapes. It is to this characteristic that the generic name remotely refers and which has given rise to the common names, tropical grapes and grape-weed. Sargasso stems are much employed in South America under the name of goitre-sticks, for the cure of goitre. *Sargassum bacciferum* is the famous gulf-weed, which forms rafts or islands floating together on vast areas of the various oceans and called "sargasso seas." The one lying in the North Atlantic Ocean, between the Azores and the Antilles (roughly 20° to 38° north latitude and 30° to 65° west longitude), its exact position being determined by the central whirl of the Gulf Stream, is so dense as to be often a hindrance to navigation. It covers a territory nearly equal to the European continent and was discovered by Columbus on his first voyage, he and the succeeding Spanish navigators calling it the Mar de Sargasso; it is connected by a narrow belt with a smaller sea between the Bermudas and the Bahamas. There is still another sea in the Pacific and one in the Antarctic Ocean. It is a disputed question whether the weeds have been torn from the shore and blown to their final resting place or whether they live and propagate themselves on the high seas. At any rate these floating islands furnish a permanent home to many small pelagic animals and of predaceous animals seeking them as food.

SARGENT, Dudley Allen, American educator, lecturer and director of physical training: b. Belfast, Me., 28 Sept. 1849. In 1875 he was graduated at Bowdoin College and in 1878 received the degree of M.D. at Yale University. From 1879 he was director of the Hemenway Gymnasium at Harvard University and from 1879 to 1889 was assistant professor of physical training at Harvard. In 1881-1916 he was director of the Normal School of Physical Training at Cambridge, Mass., and since 1916 has been president of its successor—the Sargent School for Physical Education. In 1907-16, Dr. Sargent was president of the Health Education League. He is the inventor of modern gymnasium apparatus, of the Sargent Anthropometric charts, and has published 'Universal Test for Strength, Speed and Endurance' (1902); 'Health, Strength and Power' (1904); 'Physical Education' (1906); also numerous articles and papers on physical education.

SARGENT, Epes, American poet and dramatist: b. Gloucester, Mass., 27 Sept. 1813; d. Boston, Mass., 31 Dec. 1880. He was educated at Harvard, was for a time connected with newspapers in Boston and New York, and in 1836 began writing for the stage. His plays include the 'Bride of Genoa'; 'Change makes Change'; 'Velasco,' and 'The Priestess.' He published 'Songs of the Sea' (1847); 'Poems' (1858); 'The Woman who Dared' (1869); his most noted lyric being 'A Life on the Ocean Wave.' His novels include 'Wealth and Worth' (1840); 'What's to be Done' (1841); 'Fleetwood' (1845); 'Peculiar: A Tale of the Great Transition' (1863). Still other works are 'Life of Henry Clay' (1843); 'American Adventure by Land and Sea' (1847); 'The Critic Criticised' (1856); 'Arctic Adventures by Sea and Land' (1857); 'Original Dia-

logues' (1861); and posthumously 'Cyclopædia of English and American Poetry' (1883).

SARGENT, Frank Pierce, American labor leader and government official: b. East Orange, Vt., 18 Nov. 1854; d. 1908. He was engaged in various occupations until 1880, when he became fireman on the Southern Pacific Railroad. He was chief of the Brotherhood of Locomotive Firemen in 1885-1902 and was prominent in the strikes of 1892-94. He gained the reputation of a forceful leader for the firemen, and at the same time was notable for his moderation and reasonable methods of dealing with employers. He was offered appointments as member of the Industrial Commission and as director of the Bureau of Printing and Engraving by President McKinley, but declined because of his desire to remain with the brotherhood. In 1902, however, he accepted President Roosevelt's appointment of him as Commissioner-General of Immigration, an office he occupied until his death.

SARGENT, Henry, American artist and soldier: b. Gloucester, Mass., 25 Nov. 1770; d. Boston, Mass., 21 Feb. 1845. He studied art in England in 1793-97. In 1799 he entered the United States army, was aide-de-camp to the governor of Massachusetts with rank as colonel in the War of 1812, and later adjutant-general. He served two terms in the legislature and afterward resumed his profession. His first painting, 'The Landing of the Pilgrims,' was ruined by being rolled on a pole of fresh pine, but the work of the same name at Pilgrim Hall, Plymouth, Mass., is said to be a reproduction of the destroyed work. His other paintings include 'Christ Entering into Jerusalem'; 'The Starved Apothecary'; 'The Tailor's News'; 'The Dinner Party'; a full length portrait of Peter Faneuil at Faneuil Hall, Boston, etc.

SARGENT, Herbert Howland, American soldier and military historian: b. Carlinville, Ill., 29 Sept. 1858. He was graduated at Blackburn University, 1878, and at the United States Military Academy in 1883. He was commissioned second lieutenant, Second Cavalry, 13 June 1883; first lieutenant, 19 June 1890; captain, 2 March 1899; major, 8 Jan. 1909. He served as professor of military science at the University of Illinois, 1886-87, and served on frontier. At the outbreak of the Spanish-American War he was ordered to Washington to help organize volunteer forces and was colonel of the Fifth United States Volunteer Infantry, 20 May 1898-31 May 1899. He organized a regiment at Columbus, Miss.; served at Santiago and Guantánamo, Cuba, under Gen. Leonard Wood, and as lieutenant-colonel of the 29th United States Volunteer Infantry 5 July 1899 to 10 May 1901. He fought insurgents in the Philippines and commanded attacking forces 19 Dec. 1899 at the battle of San Mateo in which Major-General Lawton was killed. He was recommended by Generals Wood and Otis for brevets for meritorious service in Cuba and Philippines, 1898-99. He was professor of military science and tactics at the Agricultural and Mechanical College of Texas, 1903-07, and graduated at the Army War College in 1909. He retired November 1911. On 27 June 1917 he was recalled to active duty and until 25 Sept. 1917 was assistant to the quartermaster's department of the Western Department, after

which he was professor of military science and tactics at Princeton University. He has written 'Napoleon Bonaparte's First Campaign' (1893); 'The Campaign of Marengo' (1897); 'The Campaign of Santiago de Cuba' (1907). He was ordered to Washington in November 1907 from South Dakota, where he was taking part in an Indian campaign to receive from President Roosevelt in person an especial compliment on his history of the campaign of Santiago de Cuba.

SARGENT, John Singer, American painter: b. of American parents, Florence, Italy, 1856. He was educated in Italy, France and Germany, and received his early art training under Carolus Duran. He was elected member of the Royal Academy of England in 1891 and of the National Academy of Design, New York, in 1897. He has lived abroad all his life and has never spent more than a year in the country of his parents. Having had the advantage of being chosen by Carolus Duran as an assistant in the execution of important government commissions, he thoroughly mastered the secrets of French technique before adopting a method and style which are purely his own. His chief works are in portrait and genre. Among his portraits may be mentioned that of 'Carolus Duran'; 'General Leonard Wood'; 'Mr. Joseph Jefferson'; 'Major Francis Lee Higginson'; 'Homer Saint Gaudens'; 'President Roosevelt'; 'Henry G. Marquand'; 'William M. Chase'; 'Carmencita'; 'Ada Rehan.' His genres include 'Fishing for Oysters at Cancale'; 'Neapolitan Children Bathing'; 'El Jaleo.' His most ambitious and original works, however, are the decorations in the Boston Library, which include the now famous 'Frieze of the Prophets.' As a painter his manner is French in brilliant versatility and epigram, but his treatment infinitely superior to the millinery effects of Duran and his school. His portraits reflect clearly the characteristics of his sitter and his intuition is unerring in detecting the subtlest traits of individuality. As a specimen of his wall-painting we may cite that portion of the Boston Library decorations known as the 'Dogma of the Redemption.' It is divided into an upper and a lower panel which would seem to represent Heaven and Earth severally. In the upper panel are the three persons of the Trinity enthroned, with hands raised in blessing, the Father wearing the triple crown, or tiara; each enrobed in a flowing, cope-like garment. In the centre of this picture is set up the cross on which Christ is suffering, while Adam and Eve catch in chalices of gold the blood that drips from his hands. Below the foot of the cross is the pelican, symbol of self-sacrificing love. Above the arms of the cross runs the inscription *Remissa sunt peccata mundi* ('The sins of the world have been remitted'). Across the molding which separates the two divisions of the subject is a monkish distich.

*Factus homo factor hominis, factique redemptor,
Redimo, corporeus corpora, corda deus.
(I, man's maker, now made man, and redeemer of him I made,
God in flesh, redeem all human hearts and bodies.)*

In the lower panel are angels bearing the instruments of the passion, namely, the reed, the nails, the spear, the pillar of scourging and the scourge, the crown of thorns and the ladder. The work has all the pomp and dignity of

Byzantine conventionalism, and for richness of color and splendor of arrangement is one of the most impressive of this magnificent series. It is deeply devotional in tone and must be looked upon as among the finest Christian painting of the period. In 1910 Sargent practically abandoned portraiture for landscapes and genre subjects. Among his later oil paintings are 'The Weavers' (1913); 'Cypresses and Pines' and 'The Courtyard' (1914). A notable exhibition of his water-color drawings was held in London and New York in 1912, from which the Boston Museum acquired 45 and the Brooklyn Museum 83 examples.

SARGENT, Winthrop, American soldier and Territorial governor: b. Gloucester, Mass., 1 May 1753; d. New Orleans, La., 3 June 1820. He was graduated at Harvard in 1771 and in 1775 entered the Revolutionary army, serving through the war and attaining rank of major. He was interested in the development of the West, became associated with the Ohio Land Company in 1786 and was soon afterward appointed surveyor-general of the Northwest Territory. In 1787 he became its secretary and in 1798-1801 he was governor of the Territory. He served in the Indian Wars of 1791 and 1794-95. He was a member of the American Academy of Arts and Sciences. Author of 'Papers Relating to Certain American Antiquities' (1796); 'Boston,' a poem (1803).

SARGENT, Winthrop, American lawyer and author, grandson of the preceding: b. Philadelphia, Pa., 23 Sept. 1825; d. Paris, France, 18 May 1870. He was graduated at the University of Pennsylvania in 1845 and at the Harvard Law School in 1847, practised law for a short time in Philadelphia and later settled in New York. He was well known in the periodical press as a writer on history and genealogy. Author of 'History of an Expedition against Fort Duquesne in 1775, under Major-General Braddock' (1855); 'The Loyalist Party of the Revolution' (1857); 'Life and Career of Major John André' (1861); 'Les États Confédérés et de l'esclavage' (1864), etc.

SARGON, sār'gōn, a king of Assyria, successor of Shalmaneser, reigned from 722 to 705 B.C. See ASSYRIA.

SARK, sār'k, the "Pearl of the Channel Islands," situated seven miles east of Guernsey and 13 miles northwest of Jersey, is about three and one-half miles in length and one and one-half in extreme breadth. It is surrounded by inaccessible rocks, the chief landing-place, Creux (hole) Harbor, being on the east coast, where a cave has been enlarged and tunneled through the cliff to give access to the interior. The island consists of two portions, Great Sark and Little Sark, connected by a high and rocky isthmus, called the Coupée, narrowing to the width of only a few feet. On the west is the small islet of Brecqhou. Sark is annually visited by several thousand tourists owing to its interesting and picturesque scenery and numerous romantic caves. The inhabitants are chiefly engaged in fishing and agriculture. Sark is administered as a dependency of Guernsey.

SARMATIA, sār-mā'shī-ā, a name given by the Romans to the country between the Vistula and the Caspian Sea and corresponding

largely to central and southern Russia. The inhabitants were known to the Greeks as Sauromataæ and to the Romans as Sarmatæ. See **SARMATIAN**.

SARMATIAN, the name of a people inhabiting the region known as Sarmatia, who were persistent enemies of the Romans. The Sarmatians were of Aryan origin, excellent horsemen and fierce fighters. The modern Russians are probably descended in part from Sarmatians who remained in their native land and did not fall victims, therefore, to Roman or Goth.

SARMIENTO, Domingo Faustino, Argentine statesman: b. San Juan, Argentina, 15 Feb. 1811; d. Asunción, Paraguay, 11 Sept. 1888. In 1829 he fought in the insurrection against Rosas and was obliged to flee to Chile, but returned in 1836. He was again obliged to leave the country, and going a second time to Chile he established a normal school at Copiapo. He traveled in the United States and Europe 1845-47 studying modern educational systems. Returning to Argentina in 1851 he helped overthrow Rosas and in 1856 organized a department of public education of which he was the head. He was Minister to the United States 1861-68 and President of Argentina 1868-74, giving the country one of the most successful and progressive administrations it ever had. Sarmiento established schools and colleges throughout Argentina and founded a national observatory. He was the author of 'Popular Education' (1848); 'Vida de Abrahán Lincoln' (1866); 'Life of Quiroga'; 'Civilization y barbarie'; 'Las escuelas, base de la prosperidad en los Estados Unidos' (1868). See **ARGENTINA**.

SARMIENTO GAMBOA, sār-mē-ēn'tō gām-bō'ā, **Pedro de**, Spanish mariner: b. Galicia, Spain, about 1530; d. there, about 1590. He was in command of the naval station in the Pacific in 1578 and in 1579 was ordered by the viceroy to take possession of the Straits of Magellan for the purpose of intercepting Drake, then engaged in his depredations off the coasts of Peru and Mexico. Drake evaded him, returning by way of the Cape of Good Hope, and after waiting for several months he explored the coast and returned to Spain in 1580. In 1581 he was sent by Philip II, with a fleet of 24 vessels, to fortify the Straits, holding joint command of the expedition with Diego Flores. The latter became jealous of Sarmiento and deserted him, taking 12 vessels, which left Sarmiento with but four, eight having been previously destroyed in a storm. In 1583 he founded San Felipe (Port Famine), garrisoned it with 300 men and in 1584 sailed for Europe, but was captured by the English and imprisoned until 1588. His colony lost all but two of its members by starvation, one being rescued by Cavendish in 1587 and another by Mérieux in 1589. After his liberation he endeavored to secure redress for his treatment by Flores, but his complaint was neglected and he died in poverty.

SARNIA, sār'nī-ā, Canada, town, port of entry and county-seat of Lambton County, Ontario, on the river Saint Clair, near Lake Huron, and on the Grand Trunk and Lake Erie and Detroit River railways, opposite Port

Huron, Mich., with which it is connected by ferry and by the famous Saint Clair tunnel, two and one-quarter miles long, built and operated by the Grand Trunk Railway. Sarnia has a good trade in grain and livestock and oil and salt refineries, tanneries, breweries, foundries and machine shops, flour and saw mills, and manufactories of carriages, agricultural implements, woollens, wooden-ware, etc. It is lighted by gas and electricity and has a good water system.

SAROLEA, sār'rō-lā', **Maurice**, Belgian educator, war correspondent, editor and author: b. Tongres, 25 Oct. 1870. He was educated at the University of Liège and later studied at Paris, Palermo and Naples. He traveled in North Africa, America, the Caucasus and the Near East, and since 1894 has been first lecturer and head of the French and romance department at the University of Edinburgh. He was Belgian consul at Edinburgh from 1901, and founded and was editor of *Everyman* in 1912-17. He became war correspondent of the *Daily Chronicle* in 1914 and at the close of 1918 had raised \$300,000 for Belgian relief. He is general editor of the Collections Nelson and Gallia. Author of 'H. Ibsen' (1891); 'La Liberté et le Déterminisme' (1893); 'The Russian Revolution' (1905); 'The Balkan Question' (1906); 'Victor Hugo' (1911); 'How Belgium Saved Europe' (1916); 'Nurse Cavell' (1916); 'German Problems and Personalities' (1917); 'La Reveil de la France' (1918), etc.

SARONIC GULF (SINUS SARONICUS), Greece, the ancient name of the Gulf of Ægina. See **ÆGINA**.

SAROS, sār'rōs, in *astronomy*, an ancient Assyrian period, the origin and exact length of which are unknown, though they have been the subject of much disputation. By some authors the saros has been confounded with the Metonic cycle.

SARPEDON, sār-pē'dōn, one of the heroes of the Iliad, slain by Patroclus at the siege of Troy. His grandfather of the same name is represented in Grecian mythology as the son of Zeus and Europa, who founded a kingdom in Lycia.

SARPI, sār'pē, Paolo, Italian historian: b. Venice, 14 Aug. 1552; d. 14 Jan. 1622. He entered young into the religious order of the Servites and was appointed chaplain to the Grand Duke of Mantua and lecturer on the canon law. After two years he returned to Venice and became provincial of his order (1578). He was afterward made procurator-general of the Servites (1585). His leanings toward Protestantism and his intercourse with Protestant leaders brought on him the imputation of favoring heresy, if not of being a heretic. In a dispute between the Pope and the Venetian government on the subject of ecclesiastical matters Father Paul showed himself a strenuous advocate of Venice and was summoned to Rome to answer for his conduct, but the affair was compromised. His political enemies attempted to assassinate him in 1607, on which occasion he received many dangerous wounds. Father Paul employed the latter part of his life in writing the history of the Council of Trent, a work which has proved of little historical value and is now accounted to be

untrustworthy on account of its extreme and evident partisanship. His labors extended to diverse branches of knowledge; he was skilled in the canon law, and was also distinguished for his acquaintance with anatomy. He appears to have discovered the valves of the veins which facilitate the circulation of the blood. His 'Istoria del Concilio Tridentino' was first published in London in 1619, having been transmitted to that country through the medium of the British resident at Venice, Sir Henry Wotton, a personal friend of the author. This work is strongly anti-papal, nay, even rationalistic in tone and was answered by a voluminous work on the same subject by the Jesuit Pallavicino. The works of Father Paul were printed at Verona 1761 (8 vols.) and at Naples 1790 (24 vols.). His life has been written in Italian by Bianchi-Giovini (1836), and in English by A. Robertson (1894). Consult also *Atlantic Monthly* (January and February 1904); Trollope, T. A., 'Paul the Pope and Paul the Friar' (1860).

SARRACENIA, sār-ā-sē'nī-ā, a genus of carnivorous plants, of about eight species, growing in bogs in eastern North America and named in honor of Dr. J. A. Sarracin. They have peculiar large nodding flowers solitary on their scapes. The five sepals are bracted at the base and the five fiddle-shaped petals are purple, brown or yellow and hang about a style which is dilated at the apex until it resembles an inverted umbrella, with five rays, terminating in hooked stigmas under the angles. The anthers are grouped about the base of the styles. The three- to five-celled ovary becomes a colored capsule in fruit. The name "side-saddle flower" has been given because of its resemblance to a pillion. The origin of the other vernacular names — pitcher plant, trumpet leaf or huntsman's horn — is very evident, for the leaves are hollow and with a lid more or less erect.

These leaves are dispersed in rosettes and are very curiously adapted, in the several species, for entrapping and digesting insects. The most common species is *Sarracenia purpurea*, which has tubular leaves, inflated at the middle and contracted at the orifice, where a heart-shaped wing, curved somewhat like a scoop, joins the hollow leaf. Another ribbon-like wing, starting from the base of the leaf, extends along the concave surface of the tube to the orifice. The whole pitcher-like leaf is green, veined with reddish purple. The scoop-like wing at the summit of the leaf catches rain-water and deflects it into the pitcher, which is often half-filled. The inside of the scoop is lined with glandular hairs which secrete honey, and the whole inner surface of the pitcher is lined with stiff spinous bristles, slippery and pointing downward, and the nearer the base the longer the points become. The reason for this apparatus appears when insects are attracted to the *Sarracenia* by the honey secreted in the hood-like wing. Some fly to it, some crawl up from the ground, helping themselves to climb by the longitudinal wing. Once there they feed on the honey, but if they carelessly stray from the wing to the orifice, where the slippery bristles begin, they promptly fall into the water collected in the pitcher. In spite of their struggles they can never crawl up past the relentless

chevaux-de-frise of glassy, down-pointed teeth, and ultimately drown in the liquid. So many sometimes meet this tragic death that the putrid odor arising from the pitcher is offensive. Just what happens to the decaying bodies does not seem to be certain. Other carnivorous plants digest their victims with acid secretions and pepsin, and insects seem to be macerated in the *Sarracenia purpurea* pitchers more quickly than by ordinary rain-water, yet it is believed that the plants profit mainly by the liquid manure obtained. Consult Darwin, 'Insectivorous Plants' (new ed., New York 1900).

SARRAIL, Maurice, French general: b. (?). In 1913 he commanded a division of the Sixth Army Corps at Rheims and at the opening of the war was sent to command at the Argonne. Together with Dubail he protected the French right flank against the most ferocious attacks from Thionville and Metz. He splendidly organized the defense of Verdun, holding it against the rush of the Germans in August and September 1914 with the Third Army. Much of the strategy in the retreat to the Marne was given to his execution. About the middle of the year 1915 he was withdrawn from command but was appointed commander-in-chief of the Army of the Orient in August to succeed Gouraud. He made Saloniki, Greece, his headquarters and with his forces, which were a mixture of troops of the most heterogeneous nature (British, French, Italian, Greek, East Indian, African, etc.), he captured Monastir in December 1915 but advanced no further. He was recalled December 1917.

SARSAPARILLA, an alterative drug obtained from the roots of a species of *Smilax*, indigenous to Central and South America. The drug-yielding species of this genus, to which the American cat-briers belong, are not very exactly identified, although sarsaparilla has been known to Europeans since 1536-45, and was extensively used soon afterward. *Smilax officinalis*, *S. medica* and *S. papyracea* are believed to be the principal sources of supply of sarsaparilla. They are tough, twining shrubs with square or round prickly stems, small flowers and generally shining leaves. Sarsaparilla plants were somewhat cultivated in Jamaica, but are chiefly obtained by trade with the aborigines of the countries where they grow. The drug itself is extracted from the horizontally creeping roots of the *Smilax*, which radiate from the stems, and are so long that it takes an Indian many hours to disentangle them from the soil and other roots. They are then dried and wrapped for transportation. The form of the original package in which the roots reach the pharmacist is an indication of the market from which it is sent, and the country from which it is exported furnishes the commercial name of the drug. Thus, Rio Negro, otherwise known as Para or Lisbon sarsaparilla, is always exported in cylindrical bundles, about three and one-half feet long and five or six inches in diameter, composed of finely wrinkled roots, brown with adhering earth, cut square and even at both ends, and wound closely with the stems of *Pothos*. Jamaica sarsaparilla (a name which formerly included many other varieties, now differentiated) is sent out loosely. Sarsaparillas are classed as mealy or non-mealy sarsaparillas, according to the amount of starch

granules in the parenchyma, a condition which seems to depend upon locality, and they differ in the color of their barks and in microscopical characters.

Several plants are used as substitutes for true sarsaparilla. The aromatic roots of *Aralia nudicaulis* and *A. hispida* furnish respectively the wild and bristly sarsaparilla, in America (see ARALIA). Texas sarsaparilla comes from the roots of *Menispermum canadense*. Australia has its spurious sarsaparilla in the spindle-shaped root of *Hardenbergia*. Indian sarsaparilla is derived from *Hemidesmus indicus*; German sarsaparilla is the roots of various species of *Carex*, while the Italian drug of that name is the root of *Smilax aspera*.

SARFIELD, Patrick, EARL OF LUCAN, Irish Jacobite: b. Ireland, about 1645; d. Netherlands, 19 August 1693. He became a colonel in the Irish army in 1686 and was a strong supporter of the cause of James II in Ireland, by whom he was created Earl of Lucan. He drove the English out of Sligo, fought at every important engagement of the war and had charge of the defense of Limerick. When that city capitulated in 1691, he crossed over to France where James gave him command of the Irish troops in the intended invasion of England the following year. After the battle of La Hogue, 19 May 1691, he tendered his services to France, fought at Steenkirk on 3 Aug. 1692, and was mortally wounded at Neerwinden in the battle of Landen, 19 August.

SARSI (sär'sē) **INDIANS**. Also Sarcee, Sarsee, Sussee, etc., from a Blackfoot word said to signify "not good." Their own name is Sotemia. A tribe of the Montagnais division of the Athapascan stock of North American Indians who formerly subsisted mainly by hunting, fur-trading, but who now gain a livelihood by farming, stock-raising and haying and as laborers. They are under the Sarcee agency at Calgary, Canada.

SARTAIN, sār'tān', Emily, American artist: b. Philadelphia, 17 March 1841. She is the daughter of John Sartain (q.v.), under whom she studied and worked at engraving, afterward studying (1864-70) at the Pennsylvania Academy of Fine Arts, then in Italy, and still later (1871-75), under Luminais, in Paris. She excels in mezzotint engraving, in etching and in portrait-painting; has accomplished much in book-illustration and the etching of framing prints, and in genre work has also distinguished herself. She received a medal at the Centennial Exhibition in 1876, and the Mary Smith prize at the Pennsylvania Academy in 1881 and 1883. In 1875 and 1883 she exhibited oil paintings at the Paris Salon. From 1881 to 1883 she was an editor of *Our Continent*, and after 1886 principal of the Philadelphia School of Design for Women. In 1900 she went to Paris as official delegate from the United States government to the International Congress on Instruction in Drawing.

SARTAIN, John, English-American engraver and editor: b. London, 24 Oct. 1808; d. Philadelphia, 25 Oct. 1897. Before reaching his majority he did notable work, having studied line engraving under John Swain; and his illustrations for Ottley's books on early Italian prints (1826) gave promise of his future achievements. He came to the United States in

1830, settled in Philadelphia and introduced in this country mezzotint, which he had begun two years earlier to practise. Entering actively into his work here, he added to engraving miniature-painting on vellum and ivory and portrait-painting in oil. He was the designer of several public monuments, of which the best known is that to Washington and Lafayette in Philadelphia. He was also editor of the *Foreign Semi-monthly Magazine* and of the *Union Magazine*, which he renamed *Sartain's Union Magazine*. Among his more important engravings are 'Christ Rejected' (1862), after Benjamin West; 'The Ironworker and King Solomon' (1876), after Christian Schussele, and the 'Battle of Gettysburg,' after Rothermel. He engraved many other historical paintings and also portraits of famous Americans, after well-known artists. By his long and varied career of productive work, his services as chief administrator of fine arts at the Centennial Exhibition in 1876 and through the many positions which he held in connection with prominent societies and institutions, he accomplished results of great importance in the development of art, particularly the art of his adopted country. He wrote 'Reminiscences of a Very Old Man' (1899).

SARTAIN, William, American landscape, genre and portrait painter: b. Philadelphia, 21 Nov. 1843. He is the son of John Sartain, and after graduation from college engraved for three or four years, then studied under Schussele and at the Pennsylvania Academy of Fine Arts. He then went to Paris and studied seven years under Bonnât and at the École des Beaux Arts. He traveled in Spain, Italy and Algiers, and after exhibiting in London (1875) and New York Academy (1876) returned to America, settling in New York. He was one of the original founders of the Society of American Artists and was for some years professor of the life class of the Art Students' League, New York. His oil paintings include 'Italian Head' (1876); 'Narcissus' (1878); 'Near Algiers'; 'Young Musician'; 'Nubian Schiek'; 'Chapter from the Koran' (in Metropolitan Museum); 'In the Basilicate'; 'Portrait of his Mother,' and other portraits. He now has studios in New York and Paris. Represented in many museums in the United States and South America.

SARTO. See ANDREA DEL SARTO.

SARTO, Giuseppe. See PIUS X.

SARTOR RESARTUS. Among autobiographies, Sartor Resartus ("the tailor patched") remains unique. It was built up out of Carlyle's thinking and his experience of life during his first happy married years at Craigenputtock. It is a thickly veiled autobiography. Thomas Carlyle appears in a mask as Diogenes Teufelsdröckh, professor of things in general in the German university of Weissnichtwo. The second book deals with the advent, education, love affair and spiritual development of this remarkable professor. This is the most easily understood portion of the book and contains the most famous passages, such as the noble chapter, "Natural Supernaturalism." The first and third books profess to give translated excerpts from this imaginary professor's imaginary treatise on clothes, with comments and explanations by the "English editor." These

are Carlyle's radical opinions set forth, not in a complete system, but as fragments of a philosophy.

Most undeservedly 'Sartor' has the reputation of being in prose what 'Sordello' is in verse. The varied, impassioned, richly allusive style is supposed to be "German," and the matter to be beyond ordinary human comprehension. This widespread misconception is due to the fact that 'Sartor' appeared at a time when "German" was a synonym for "mysterious." Carlyle learnt his peculiar style in his father's house before he knew a word of German. There is difficulty in grasping Carlyle's unusual ideas, because they are unusual, not because they are presented feebly or obscurely. The narrative portions offer no difficulties. "It is a work of genius, dear," was Mrs. Carlyle's criticism; and the world has come to agree with this verdict.

The spiritual experience delineated in the second book is typical. Teufelsdröckh at the nameless university loses the simple creed of childhood and passes into doubt, denial, unbelief. He is in consequence utterly miserable. From this stage in his spiritual progress he passes, by way of the "Centre of Indifference" to "The Everlasting Yea," or positive working philosophy. The main ideas of renunciation, duty, work are derived from Goethe, whom Carlyle revered.

America welcomed 'Sartor' before the writer's own country. Thanks to Emerson, an American publisher had the honor of producing the *editio princeps*. America also led in appreciation. The philosophy of 'Sartor' had no little share in bringing on the Transcendental movement in New England. It exerted a great influence over Carlyle's contemporaries. Such leaders of thought as Emerson, Huxley, Tyn-dall, Ruskin and Kingsley confess their debt. An edition of 30,000 copies sold before Carlyle's death. The first critical edition of the text with full notes and introduction by Archibald MacMechan appeared in 1896.

ARCHIBALD MACMECHAN.

SARTORIUS, the tailor's muscle (from the Latin *sartor*, a patcher, tailor), a muscle of the thigh which is attached at one end to the edge of the anterior, superior, spinous process of the ilium or chief bone of the pelvis, and at the other to the superior, anterior and internal part of the tibia. It takes its name from the fact that it is by the contraction of the two sartorius muscles that the legs are crossed in sitting in the manner of tailors. See ANATOMY.

SARTS, a name given to the settled inhabitants, whether agriculturists or traders, as distinguished from the nomad inhabitants of Turkestan, Afghanistan, Persia and the adjacent regions of Asia. Strictly speaking the name has no ethnological significance.

SARUM, sā'rūm, Old, England, an ancient deserted city of Wiltshire, two miles north of Salisbury, or New Sarum, to which the inhabitants of Old Sarum removed after 1219 owing to an insufficient water supply. Notwithstanding its desertion, the old site retained its electoral rights to return two members to Parliament, until its disenfranchisement by the Reform Bill of 1832. It has passed into English literature as a type of the "rotten boroughs," acquired by purchase; its most distinguished

representative was William Pitt, whose first appearance in Parliament was as member for Old Sarum.

SASIN, an East Indian antelope, the black-buck (*Antelope cervicapra*), blackish brown in color. See ANTELOPE.

SASKATCHEWAN, sās-kach'ē-wan, the central prairie province of Canada, named after the river (q.v.). Prior to 1905 it was a portion of the Northwest Territories, with an area of 107,092 square miles and with a small and scattered population. On 1 Sept. 1905 it was created a province with full rights of self-government and including the territory of Assiniboia with a portion of Athabasca. The area became 251,700 square miles of which 8,318 square miles was water surface—chiefly small lakes.

Physical Features and Climate.—The province is traversed by the North and South Saskatchewan rivers. In the farthest north is the Churchill River. The Qu'Appelle and the Souris rivers are in the centre and south. There are some large lakes, among which may be mentioned the Athabasca 2,842 square miles, the Reindeer 2,437 square miles, the Wollaston 996 square miles, the Quill lakes 163 square miles, the Last Mountain 98 square miles. The best evidence as to climate is the production of the province—its grain, vegetables and livestock compete with the best in the world. The atmosphere is clear and bright—a large proportion of sunshine, with a never-failing breeze to temper the heat of the summer days. The winters are cold but bright and dry. It is very similar in a general way to that of Alberta and Manitoba.

Progress of the Province.—The railway mileage increased from 900 in 1896 and 1,520 in 1905 to 6,148 at the end of 1919. While the long-distance telephone mileage was nil in 1900, it was 1,500 in the end of 1908 and 20,152 in 1919, with rural lines totaling 110,481 miles. The townships partially settled and under a form of local or municipal government were 882 in 1905 and 2,700 in 1919. The Loan Company investments which in 1906 totaled \$12,000,000 were in 1910 \$40,000,000. By the end of 1918 \$1,845,178 had been spent on university buildings and \$2,922,078 on Parliament buildings.

Resources.—The province is the centre of the grain-raising area of Canada, also stock-raising, fisheries and timber. The undeveloped coal resources in the southern portion of the province are of great extent. Mineral formations abound north of Township 52, but there has been no development to any great extent due to lack of railway transportation facilities. One mine, at present operating, packs ore 60 miles overland to rail-head and ships to a smelter in British Columbia. The government is conducting tests of lignite fields in the south with a view to its use for commercial purposes. In 1918 wheat acreage was 9,249,260 with a yield of over 92,492,600 bushels; oats, 4,988,499 acres, with a yield of 214,542,728 bushels; barley, 699,296 acres, with a yield of 4,894,572 bushels; flax, 840,957 acres, with a yield of 4,204,785. The value of the 1918 wheat crop at government price was \$474,139,428.88. The province is becoming more of a livestock country annually. Formerly considerable

ranching was carried on in the western part of the province, but this is now giving place to mixed farming, grain and stock-raising combined. In 1918 there were in the province horses, 1,000,076; milch cows, 352,989; other cattle, 926,342; sheep, 134,177; hogs, 521,240. Considerable of the packing of meat is now done in the province, but most of the stock is shipped east and south. The timber cut in 1918 was valued at \$2,036,029.

Settlement and Population.—Immigration poured into the province after its separate organization. To-day the whole of the eastern half of South Saskatchewan is practically homesteaded, while Central Saskatchewan, from Manitoba to the South Saskatchewan River, is thickly dotted with homesteads—excepting the heavily timbered district in the northeast. Large settlements have also been made west and south of Saskatoon, as well as south of Battleford and farther north, in the Prince Albert district. In all these districts as well as in the southwest triangle of the province—some 23,000,000 acres—which include the lands south of the main line of the Canadian Pacific Railway, from Moose Jaw west, as well as all the lands which remain unoccupied north of Swift Current and Maple Creek, there are still thousands of homesteads available. In all, there are in the province 86,826,240 acres available for settlement. Homesteading invariably proceeds from railway lines and the building of the Grand Trunk Pacific and rapid extension of other lines of railway during the past few years have been a great factor in bringing settlement to Saskatchewan. In population the province has increased from 91,000 in 1901 to 744,000 in 1919. Villages are springing up almost daily and the growth of a settlement of one family into a town of 1,000 persons within a year is quite common. Some of the more notable places are Yorkton, Weyburn, Battleford, Estevan, Swift Current, Melville, Indian Head, Rosthern, Moosomin, Wolseley, Maple Creek, Qu'Appelle, Humboldt, Strasborg, Arcola, Watrous, Lumsden, Lloydminster, Melfort and Wilkie. The larger centres are Regina (40,000), Moose Jaw (16,809), Saskatoon (21,054), Prince Albert (10,000).

History, Education, etc.—The policy of the government has been one of local development. Elaborate Parliament buildings have been constructed at Regina, the University of Saskatchewan built and organized at Saskatoon, hundreds of bridges constructed throughout the province, the telephone system acquired and managed, grain elevators worked in co-operation with the farmers, the railway-operated mileage increased from 2,025 in 1907 to 6,148 in 1919. Arrangements were made with the Canadian Northern and the Grand Trunk Pacific in 1909 for the construction of branch lines under a total government guarantee of \$11,999,000. As to education the enrolled pupils increased from 31,275 in 1905 to 135,358 in 1919; the school districts from 1,190 to 4,204.

Government.—The provincial government is vested in a lieutenant-governor and a legislative assembly of 62 members, elected for five years. Women were given the franchise in 1916. The revenue in 1916 was \$5,631,910 and the expenditures \$5,529,610.

partments; *The Public Service Monthly* (Regina); 'Bulletin IX' (Fifth Census of Canada); Black, 'History of Saskatchewan' (Regina 1913); Boam, H. J., and Brown, A. G., 'The Prairie Provinces of Canada' (London 1914); Gilbert, Louis, 'Le Saskatchewan' (Paris 1914); Short, Adam, and Doughty, 'Canada and its Provinces' (22 vols., Toronto 1913).

SASKATCHEWAN, a river in Canada, which has its sources in the Rocky Mountains near long. 115° W. It is formed by the junction of two main branches, called respectively the North and South Saskatchewan, which flow generally east to their junction, about 25 miles east of Prince Albert. Thence the river takes a curve northeast and southeast, receives the Carrot River from the south, and passing through Cedar Lake empties into Lake Winnipeg, after a course of about 1,300 miles measuring along the south branch, some 70 miles less than along the north branch. It flows through a region yielding coal, salt, iron, gold, etc., and now attracting numerous settlers. From the south branch of this great river northwest to Peace River the climate is adapted to the growth of wheat, and the valley of the river is said to be fitted to sustain as dense an agricultural population as any area of equal extent in the world. The main stream and its branches afford about 1,000 miles of navigable waterway, and steamers now ply on it.

SASSABY, or **BASTARD HARTBEEST**. See HARTBEEST.

SASSACUS, Pequot Indian chief: b. near Groton, Conn., about 1560; d. Mohawk Settlement, N. Y., June 1637. He was a powerful chief, a great warrior, and was believed by his own and other tribes to possess supernatural powers. The Pequot tribe occupied a large tract of land in southeastern Connecticut and consisted of about 700 warriors who were the terror of the settlers along the New England coast. In 1637 he attacked the English fort at Saybrook, Conn., massacred its inhabitants and then attacked Wethersfield, where he murdered several women and made captives of others. The colonists mustered their forces under the leadership of John Mason (q.v.) and destroyed the Pequot settlement, 5 June 1637. Sassacus took refuge with the Mohawks, who soon afterward murdered him.

SASSAFRAS, a tree of the laurel family (*Sassafras sassafras*), characterized by fragrant bark and roots, common in the eastern United States. Since it is readily propagated by seeds or by suckers which spring up from interminable slender root-stocks, and is apparently not liked by cattle, it is one of the first trees to reforest pastures and fields that have the light, moist soil that it affects. It is a veritable pest to one trying to clear land, as the smallest piece of rootstock left in the soil seems to send up a vigorous sprout. Its long roots, however, make it a difficult tree to transplant, unless young. Near the lower Mississippi, the sassafras attains its greatest height (about 100 feet), and is stout, with horizontal rugged branches, so that the foliage has a stratified appearance and a flattish top; it decreases in size as its northern limit is reached until it becomes only a tall shrub. The bark on old

trees is very thick and gray, with longitudinal scaly ridges; on the young twigs it is pale green and easily slips off. The shining, bright-green leaves will range in shape, on one spray, from an oval to a three-lobed outline, the "mitten shape," with one lobe at the side of the leaf, being characteristic. The flowers appear before the leaves in late winter if sheltered, and are generally unisexual, male and female blooms being found on different trees. They dangle in tassel-like racemes and are honey-colored and honey-scented, and thus attractive to bees. The staminate flowers are apetalous, with a six-lobed calyx, orange-stalked glands and nine stamens; the pistillate flowers have a similar perianth, a pale green ovary and style, and orange rudiments of stamens. The fruits are very brilliant, dark-blue, oblong, thin-fleshed berries, surrounded at their bases as the cup encloses the acorn, with a bright scarlet calyx-tube, borne on a thickened and elongated stalk. Unfortunately they are so soon taken by the birds that they are seldom seen, but the leaves assume distinct tints in autumn, which deepen from soft tones of yellow to dark red.

Sassafras is a member of the laurel family, to which camphor also belongs, and the whole plant, from the roots with the scaly, orange-colored bark to the leaves, is aromatic. Thoreau says of it: "The green leaves bruised, have the fragrance of lemons and a thousand spices." There is a legend that sassafras odor was wafted to the nostrils of Columbus on his first voyage, and convinced him that land was near.
